# What This Index Represents.

Attention is called to the foregoing Index, which affords, perhaps, the best possible *resumé* of the field covered by the FOREST AND STREAM AND ROD AND GUN. The most cursory examination of the topics discussed in the several departments will show the aim and scope of the Journal. Under the first division—Answers to Correspondents—for instance, there are indexed five hundred and sixty replies, of which more than one hundred relate to the Kennel, nearly one hundred and fifty to the Gun or Rifle, and the remaining three hundred to Fishing, Fish Culture, Game Protection, Natural History, Recipes and the wide range of subjects, concerning which our readers are constantly seeking information. Each of the divisions of the Index represents an equal range and variety of readable and invaluable matter falling within that department. The total number of such indexed subjects approaches three thousand. This represents the work of the paper for six months, or a total of nearly six thousand for each year.

The FOREST AND STREAM AND ROD AND GUN is a twenty-four page weekly Journal, published by the Forest and Stream Publishing Company, 111 Fulton st., New York. Terms, \$4 per year. Send for a sample copy.

# FOREST AND STREAM

## ROD AND GUN

THE AMERICAN SPORTSMAN'S JOURNAL.

Ter ms, Four Dollars a Year.  
Ten Cents a Copy.

NEW YORK, THURSDAY, AUGUST 9, 1877.

Volume 9.—No. 1.  
[No. 111 Fulton St., N. Y.]

(Translated from the Portuguese for Forest and Stream.)

### THE CRY OF A LOST SOUL.\*

IN that black forest, where, when day is done,  
With a serpent's stillness glides the Amazon,  
Darkly from sunset to the rising sun,  
A cry, as of the pained heart of the wood,  
The long, despairing moan of solitude;  
And darkness and the absence of all good  
Startles the traveler with a sound so drear,  
So full of hopeless agony and fear  
His heart stands still and listens, with his ear.

The guide, as if he heard a dead-bell toll,  
Starts, drops his oar against the gunwale's thole,  
Crosses himself, and whispers "A lost soul!"—  
"No, Senor, not a bird. I know it well—  
It is the pained soul of some infidel,  
Or cursed heretic that cries from hell.  
Poor fool! with hope still mocking his despair,  
He wanders shrieking on the midnight air,  
For human pity and for Christian prayer.

"Saints strike him dumb! Our Holy Mother hath  
No prayer for him who, sinning unto death,  
Burns always in the furnace of God's wrath  
Thus to the baptized Pagan's cruel lie,  
Lending new horror to that mournful cry,  
The voyager listens, making no reply.  
Dim burns the boat lamp, shadows deeper round  
From giant trees with snake-like creepers wound,  
And the black water glides without a sound.

But in the traveler's heart a secret sense  
Of nature, plastic to benign intents,  
And an eternal good in Providence,  
Lifts to the starry calm of heaven his eyes,  
And lo! rebuking all earth's ominous cries,  
The Cross of pardon lights the tropic skies!  
"Father of all," he urges his strong plea,  
"Thou lovest all; thy erring child may be  
Lost to himself, but never lost to Thee!

"All souls are Thine; the wings of the morning bear  
None from that Presence, which is everywhere;  
Nor hell itself can hide, for Thou art there;  
Through sins of sense, perversities of will,  
Through doubt and pain, through guilt and shame and ill,  
Thy pitying eye is on Thy creature still.  
Wilt Thou not make, Eternal Source and Goal!  
In Thy long years, life's broken circle whole,  
And change to praise the cry of a lost soul?"

For Forest and Stream and Rod and Gun.

### A Grouse Hunt in Sweden.

MANY years ago we had occasion to visit the town of Östersund, the capital of the Province of Nordland, in the interior of the north of Sweden. The little place is most beautifully situated on the shore of "Storsjön" (Grand Lake), one of the larger inland lakes of the country. Dotted all over with birch-covered islets, it is surrounded on three sides by high mountains; to the north the "Offerdals," to the south the "Örviiks," while to the west the "Åreskutan" raises its snow-clad head some 8,000 feet above tidewater.

Expecting some good shooting during the week or more we were obliged to stay in the place (for it was in the latter part of August), we had brought with us our John Manton and our Russian setter, Finn, "a tried friend on many a bloody field." And just here let us say a few words in *memoriam* of the best dog it ever was our good fortune to possess. When yet a pup he was presented to us by a friend in Finland; hence his name. As full grown he was of medium size, strongly built, broad chest, rather long body, and short legs; head large, ears thin, but not very long; eyes large, full of intelligence; color white, with large spots of light brown; hair long and coarse, even on the head, and somewhat inclined to curling. On the whole a very homely beast. He was extremely intelligent, and easily trained; faithful and good-natured. The first day we took him in the field he be-

haved like an old dog. I think I can safely say he never intentionally flushed a bird unless ordered to do so. He was a first-class retriever on land or in water; never much of a ranger. The greatest ranger in the world could not beat him to find game. His power of scent was marvelous and his endurance incredible. Finally, he was a first-class "reporter," which term, as applied to a dog, may not be understood in this country, but is not unusual in Sweden, where a great deal of woodcock, black game and partridge shooting is done in very close covert. The term signifies that the dog, having found the game, but not seeing his master, barks out from the point, hunts up his master, "reports" by wagging his tail or some other doggyish expression, and leads him directly back to the game. After we had hunted Finn for a season, we taught him this simply by hiding ourselves when he came on a point, and let him stand. Probably he remained on the point for an hour or more, and then he got tired of it, and as it was not in him to flush the bird, he retreated quietly and found us. We led him then at once to the game and shot it. Repeating this a few times he took it as a matter of course, and would afterward never remain for five minutes on the stand unless he saw us in the neighborhood. We hunted with this most excellent animal for ten seasons. After this digression we will continue our narrative.

At the hotel where we were staying, arrived the same day from Norway a young English baronet, whom we will call Sir Francis S., on his way to Stockholm. We had met Sir Francis before—as true a gentleman and as accomplished a sportsman as you would wish to meet. Seeing us provided with dog and gun, and himself also having a fowling-piece with him, Sir Francis proposed to join us the following day in a tramp in the mountains. Agreed. Our landlord furnished us with a sailboat and guide, and we set out next morning; but as hardly a breath of air ruffled the placid waters, we did not reach our objective point at the foot of the mountains until evening, very tired indeed from constant pulling nearly the whole time. At a small farm-house, near the lake shore, we spent the night, and here we hired another man and a pony to carry our provisions, blankets, etc., and also our expected large bag of grouse.

At 4 o'clock the next morning it was broad daylight, and we started. Following a cattle path through a dense forest of spruce and pine, on a rather steep ascent, we proceeded for five or six miles and emerged on an upland moor, where our guide, himself a hunter, told us we would find *orr-fogel* (black-game). And so we did; for within a quarter of an hour Finn came to a stand. Up went a dozen or more nearly full grown birds, and down went four of their number. We followed the direction the birds had taken, found them again somewhat scattered, picked up one after another, found two or three old cock-birds, and in about two hours had bagged nine brace. We were now on the bank of a beautiful little mountain lake, where we sat down to rest, refreshing ourselves with some excellent "Otard" Sir Francis brought with him all the way from London, took a smoke, and then resumed our upward tramp through another belt of timber, stunted and gnarled, the path more rocky and steep at every step. Finally, after a long and tedious march, we came out on an open, gently sloping terrace or table land. Naked granite ledges predominated, but in the declivities where soil had gathered was fine grass land, interspersed with patches of heather, dwarf birch (*Betula nana*), and several varieties of wild berry shrubbery. To the east and west this plateau extended for several miles, but to the north, within a distance of a mile, the very tops of the Offerdals mountains rose in precipitous cliffs to the height of more than 1,000 feet. Pasturing on the grass-land were quite a number of cattle, mostly milk cows, for this was the *satra* (summer pasture) of our landlord of the previous night, whose son Eric was our man with the pony. In a sheltered nook on the bank of a little mountain stream stood a comfortable loghouse, with stables and a cattle pen. Summer pastures of this kind, often miles away from the homestead, belong to nearly every farm in Northern Scandinavia, where the cattle are sent early in spring and kept all through the summer and fall, invariably guarded by women, the farmers' daughters or hired girls, who milk the cows and make butter and cheese.

The *satra* now before us was presided over by Eric's two sisters, a couple of handsome girls, with clean cut features, fine figures, rosy cheeks, dark blue eyes, and a "profusion of golden curls." Having heard nothing from home for some

time, they were very glad to see their brother, and our whole party shared in the welcome. Tired and hungry, having had nothing to eat and very little rest since early in the morning, we lost no time to spread our stores, to which our amiable entertainers added the freshest of butter, the sweetest of milk and the richest of cream to our coffee, with bread of oatmeal, very brittle and thin as paper. After a most hearty meal we lit our pipes, and lying down to rest outside the house, were soon wrapped in the arms of Morpheus. We were the first to wake up, rather late in the afternoon, and missing our dog, we rose to our feet and looked around. Some 200 yards or more off we observed Master Finn, head erect and tall extended, marching ahead as gravely and slowly as an alderman in a Fourth of July procession. Apparently he was on some trail, and we let him have his own way, expecting every moment to see him come to a point. But no! On he went until he was nearly out of sound of my whistle, when I called him back. Rousing the whole party, we took our guns and ammunition and started for the place. The dog soon resumed the trail, following it quite a distance without any result. It was plain that the birds were running, and probably ptarmigans, for the girls had told us they had seen plenty of them every day. We were just deliberating what to do when Eric pointed to a naked ledge some hundred yards ahead, where a whole covey of birds were standing in full view. A moment later they took flight and sailed away a short distance, lighting in a thicket of dwarf birch. Neither of us had seen these birds before in their native wilds, and we were very anxious to have a shot at them—in fact that was our principal object in climbing that rough mountain side up to the *satra*. We sent our friend on a circuitous route to the other side of the copse and then went for them ourselves with the dog, leaving the guides behind, and taking care to make as little noise as possible. We succeeded in reaching the edge of the thicket without disturbing the birds. Here Finn came to a dead point, and with our gun ready for action, we entered the copse with rapid strides. Apparently we took them unawares, for up they went helter-skelter, on all sides around us, scattering in every direction. Three or four flew directly over the head of my companion, and he made a fine double shot. We also brought down the same number, and as they had lighted all around us, within 200 yards, we lost no time to follow them up. At first they lay pretty well, and we got two more brace within the next half hour; but after that they commenced again running and we heard their whistling on all sides. The dog would take the trail, but could not get up to the bird, who was running ahead faster than Finn, always 100 yards or more ahead. At last we got tired of this; it was rather late, and we started for the house and our supper. On the way back, in a deep ravine, we came unexpectedly on another covey of ptarmigans, of which on the first rise we brought down three, and that was the last we got of them, for they sailed far away out of sight.

In the meantime our kind hostesses had not been idle, and we found spread on the table a meal that might even tempt an epicure. There was a large dish of the "speckled beauties," as the piscatorial correspondents of FOREST AND STREAM like to call them, for the brook was just full of them, and the girls knew how to catch "oring," as is the name in that part of the world; then some of the black game we had killed in the morning, baked with salt pork, offered a most tempting dish; then fresh butter, milk, bread and coffee. This was all, as far as we remember, and we did ample justice to the repast. Again we stretched ourselves down on the ground for a quiet smoke and to enjoy the view, which was magnificent. To the east a large part of the Province of Nordland was spread out, a beautiful panorama of woodland and water, interspersed with cultivated fields. To the south—it seemed at our feet—expanded the glorious Grand Lake, a mirror in a framework of rugged mountains, and far away to the west Ariskunt raised its snowy head in solemn grandeur.

It was now bed time—past 10 o'clock. The sun had just set, but its parting rays spread yet a flood of light on the summits of the western mountains.

"The hall was cleared—the stranger's bed  
Was there of mountain heather spread."

And on such a bed we slept very comfortably indeed through the short summer night. Rested and greatly refreshed by a good ablution in the cool water of the brook, and after an ample breakfast, we prepared to leave early next morning. And here comes in the least bit of romance. We were much

\* This poem was written by His Imperial Majesty Dom Pedro II., Emperor of Brazil. The cry of the *Campanero*, a Brazilian bell-bird, resembles the slow tolling of a church bell. You hear his toll, and then a pause for a minute, then another toll, and then a pause again, and then a toll, and again a pause. Then he is silent for six or eight minutes, and then another toll, and so on. Actæon would stop in mid-chase, Maria would defer her evening song, and Orpheus himself would drop his lute to listen to him, so sweet, so novel and romantic is the toll of the pretty snow-white *Campanero*. To the superstitious half-breed the note is one of horror, for he believes it to be the cry of a soul condemned to the torments that the Church prescribes for the damned.—Ed.]

pleased with the entertainment, and felt very grateful to the girls, who had had a great deal of trouble for our sake. My friend spoke about pay, but I explained to him that an offer of that kind would never do: apparently they considered us as guests. We had come there with their brother, and it was plain that the old folks at home had given instructions to treat us hospitably at the *saltra*. They were people in good circumstances. But our English friend, with plenty of guineas in his pocket and elsewhere, on saying good-bye, pressed in the hand of each girl a gold coin with the image of "Her Most Gracious Majesty," which we explained (our friend not being versed in the Norse tongue) that they (the girls) must hold as keepsakes in remembrance of our visit. Blushing and courtesying, they grasped the hands of the donor for kissing—a mark of respect among the peasantry of that country to men of great estate. But my friend would not understand it in that way. He was equal to the emergency, and with becoming decorum imprinted a kiss on each pair of those rosy lips.

"Hont soit qui mal y pense."

Our return was taken by a much longer but less precipitous route, the same path in fact by which the cattle make their yearly journeys to and from the *saltra*. For several hours nothing of interest occurred. We hurried on, wishing to reach Grand Lake and return to Östersund as quickly as possible. Finn was at my heels most of the time. But toward noon, in a thicket of young pines close to the path, he suddenly came to a point. Of course we were ready, and out of the thicket darted half a dozen or more small birds, not much larger than pigeons. We got one each. This was a covey of Hjerpar (*Tetr. bonasa*), the small woodgrouse. They settled in a cluster of large spruce trees, not far away. Reloading, we went there without delay. We had seen plainly where they lighted, but look as we may we could not discover them among the thick branches. At last Eric got his eye on one and tried to point him out to us. But no; we could not see him, and we gave our gun to the young man, telling him to shoot the bird, which he did. We then, with our friend, lay down to rest. We let Eric keep our piece, with permission to shoot any birds he could discover in those big spruces. And, right enough, he soon shot two more.

We moved now only a short distance to a fine spring, the location of which was well known to our guides, and here we spread our luncheon, refreshing and resting ourselves for a couple of hours. Then on again toward Grand Lake, which was yet some ten miles away. After proceeding some distance our path led us along the shore of a long but narrow lake. Our guides had before this told us that in this vicinity, if anywhere, we might find the "cock of the woods, the great Capercailzie," (*Tetrao urogallus*), whose acquaintance Sir Francis was very anxious to make, this being, in fact, the principal object for his joining us on this excursion. In anticipation of such an event we had loaded our pieces with much coarser shot and heavier charges of powder. We had passed for the last hour or more through an open pine forest of heavy timber, with a low undergrowth of heather, upland cranberry and blueberry vines; but although Finn had been industriously at work he had not found anything. We came now to an opening in the forest, a kind of low meadow or marsh, running up from the lake some distance into the timber. In this opening were scattered here and there small blueberry patches, the shrubbery two or three feet high. At one of these patches, on the very bank of the lake, our dog made game; advanced, creeping a few steps, and then threw himself flat down, as was his habit when under the influence of a strong scent. We did not doubt for a moment, nor did our men, that here we had found what we were in search of. On our suggestion we intended to advance from the lake side into the copse, in order to drive the birds toward the timber; but before this maneuver could be executed, up rose, all of a sudden and with a tremendous noise, some eight or ten birds, within twenty feet from where we stood. Truth compels us to say that at this, the best opportunity we had during the whole trip, we got only two birds. They got up before we were quite ready for them, and Eric with his pony and the other man were between us and the game when rising. Both of us missed with the first barrel, but, with the second we cut down a bird each, some thirty yards off, both falling in the lake, which all the remainder crossed, and were thus lost to us, for there was no boat, and it would take several hours to get around the water, which our time did not allow. Those we got were young, three-fourths grown birds, weighing probably eight to ten pounds each. Our enthusiasm was greatly softened down by the certainty that all the balance of this magnificent family had escaped us; but hoping to find some more of their relatives in the vicinity, we made Finn for more than an hour carefully examine every one of those blueberry patches. But nothing was found until we came to a small stream, which, on the other side, separated the meadow from the timber. Here Finn again, in his usual style, commenced marching up the left bank of the water course, toward a thicket of some kind of shrubbery. It was plain he was making game, and we followed close on his heels. We had not to wait long, for before the dog came to a stand, up rose a bird as large as a turkey-gobbler, which Sir Francis brought down handsomely at a distance of some forty yards. It was an old "cock of the woods" in full plumage, his green neck shining with a beautiful lustre. As we afterwards ascertained, he weighed fully fifteen pounds. Under ordinary circumstances my friend was by no means an enthusiastic or demonstrative man; his motto seemed rather to be, *Nil admirari*! But to say that he was delighted would only feebly express his feelings on this occasion. He did not exactly "jump out of his boots," but his countenance was illumined with exceeding joy as he took hold of his big bird and exclaimed: "*Finis coronat opus*," and added, "I would give a ten-pound note to have that bird stuffed." This was our last shot. Without further interruption we arrived at the farm-house in the evening, got some supper, thanked and said farewell to the old people, paid Eric liberally for himself and pony, sent our "best love" to the girls, and with a favorable wind set sail for Östersund, where we arrived in the "wee small hours" of the morning, very much pleased with our excursion. Our game bag contained three capercailzies, eighteen black game, eleven ptarmigans, five woodgrouse. Later in the day—being in those times quite a taxidermist—we skinned the great bird, got the apothecary to make us an ointment with pulverized arsenic, with which we rubbed the inside of the skin, made a temporary body and neck of cotton, put it all in a strong wooden box, and delivered it to our English friend with our compliments. In Stockholm, where Sir Francis arrived some days later, the bird was put in the hands of a skillful professional bird stuffer, who finished it in fine style, and that bird now adorns the library in my friend's ancestral hall in old England.

This excursion is fresh in my memory for three reasons: 1st. It is the only time I ever shot ptarmigans; 2d. The only

time when, in one excursion, I killed all four varieties of Swedish grouse; and last, but not least, on account of my English friend and his big capercailzie. J. S.

## For Forest and Stream and Rod and Gun. TO NATCHEZ BY RAIL AND RIVER.

"The heads of many people were bobbing in sleep,  
And many babies lifted their voices up to weep."

—Song of the Rail.

THE newly risen sun was shining brightly on a lovely May morning, as I stepped aboard a train on the Memphis and Charleston Railroad. The train was westward bound, and, as I took my seat, the man with a silver dog collar on his hat "yanked" the bell-rope, the whistle sounded, and the iron horse, breathing steam and coal smoke from his fiery "inards," moved slowly out, dragging his rumbling load behind him over the trestle, out past Fort Robinson, where the gallant Col. Rodgers lies buried just where he fell—"in the imminent deadly breach"—storming the enemy's works. Then, as our Pegasus warms up to his work, on past the lake where we have our winter duck shooting, past Big Hill, where we go to hunt the bearded gobblers, and after two hours' steady running he pulls up hot and panting at Grand Junction. Here we change cars for Jackson, Miss., taking the Mississippi Central Railroad. In good cars, and on a smooth track, we bowl along at a pretty fair lick past Michigan City, on past Holly Springs, a pretty and thriving town; both places the scenes of cavalry fights during the late unpleasantness.

At two o'clock we reach Oxford, a handsome place, although you do not get a view of it from the train. The State University is located here, and within its halls some of our most distinguished southerners have been educated. Leaving Oxford we rush on by several minor places; go right through Water Valley, quite a busy place and appropriately named; pass Duck Hill, which is in a valley and not a duck in sight, and on to Grenada, where the Mississippi and Tennessee Railroad comes in. As the shades of evening come down we arrive at Durant, where, having washed the dust of travel from our countenances, we worry down a most fearfully execrable glass of beer, and after it, as some amends, a splendid, old-fashioned, *ante-bellum*, country hotel dinner.

At ten o'clock we arrive at Jackson, and after having vainly spread our limbs and couched our heads, after the style of Lord Marmion, we are knocked up by boots, with the cry, "Train for Vicksburg." Boarding this we are rushed into the "City of Hills" as the sun rises.

Here we are assailed by a swarm of savage, bloodthirsty, impecunious hackmen, porters, hotel bunnies, gamins, newsboys and small niggers. They were absolutely frantic to get at us, and we only escaped being dismembered and carried off piece-meal through the intervention of a policeman, who came gallantly to our rescue, and, with his club, beat back the horde of howling savages.

After having at the hotel partaken of an exceedingly durable beefsteak, a remarkably tenacious biscuit and a cup of tepid fluid, yclept coffee, we sallied forth to see some friends. These we did not find, but we did make the acquaintance of one of the cleverest gentlemen in the State, who put us under obligations we fear we may never be able to repay, by taking us to visit all points of interest in and around the town, behind as fine a stepper as I have seen in many a day. Vicksburg is built on the tertiary hills where they strike the river. These hills are here upheaved in a most remarkable way, and the soil is filled with minute fossils and concretions of carbonate of lime. The bluffs cave but little, and in them are still to be seen the bomb-proofs and holes in which the citizens sheltered themselves from the hissing shot and bursting shells during one of the most desperate and prolonged sieges and defenses of modern times.\*

Driving through the streets we saw many handsome residences, well-built churches, and a fine court house located on the summit of a series of terraces. The streets have been graded at a considerable outlay of money, time and labor. Northeast of the town are the remains of an old Spanish fort, crowning a high bluff, that commands a splendid view of the river and adjacent country. From its grassy ramparts we can overlook the Federal Cemetery—"the bivouac of the dead"—where lie, until the last reveille, the ashes of 16,000 soldiers, the rows upon rows of headstones gleaming white in the morning sunlight. In front of us rolls the broad river, and through the trees we can catch glimpses of the fair country beyond and the villages of Delta and De Soto. Away off to the right is the mouth of the Yazoo River; to the left the little city lies bathed in hazy smoke, as peacefully as if it were never stormed at with shot and shell.

Driving back we saw the "gamblers' graves." They were buried on the side of a steep hill, through which a street is now being graded, the excavations bringing to view the crumbling bones of those desperadoes who years ago defied the law, and, when finally taken, after a desperate resistance, were lynched and buried here. South of these graves, on a high bluff that overlooks the town, is the site of another fort built by the Confederates. Here a huge gun, lying half buried in the sod, recalled a picture I once saw or read about entitled "Peace"—an old redoubt, overgrown with grass and wild flowers, from which protruded a cannon; in the muzzle birds had built a nest, and were feeding their fledglings. Here children had built their doll-houses—"even in the cannon's mouth"—and romped and gambled within the grassy ramparts—

"Made rankly fertile with the blood of men"—

where erst had stood the grim artilleryman hurling the shrieking messengers of death from his smoking gun. Upon this hill a wealthy Englishman built a house after the style of a feudal castle; but it has long since been razed, and not a vestige of it remains.

As we were going to another point of interest we were met by the hotel porter, who informed us, "Dat de boat done been at de landing hour an haf; gwine to leave stret off." Down the hill we drove, and reached the wharf just as the grumpy deck hands were about to finish unloading a coal barge. Black and ragged, and streaming with perspiration, they sang merrily at their work, inspired, perhaps, by the near prospect of a rest. As we were watching them a little tug came alongside to take away the barge. A large steamboat lay just below us, with stern up stream, from the force of a counter current, right in the way of the barge. I looked on with some curiosity

\* I saw it stated in a Vicksburg paper that three hundred tons of lead, mostly bullets, had been collected in and around the town since the close of the war. This lead would make nine million six hundred thousand ounces balls. God knows how many more are buried in the earth and lost in the river.

to see how the tug was going to get it out. Slowly it moved up to the steamboat until the bow was against the steamer's guards, abaft the wheel. "Go ahead on her," said the pilot. The little screw churned the water, and the huge steamer was shoved slowly around, until it lay stern down stream, out of the way. Then the barge was cast loose and towed away. Our steamer's broad stage-planks were hoisted, like ponderous drawbridges. The bell tapped, "Let go," and there was a jangling of little bells down below, a hissing of steam, a prolonged "clew," the ponderous wheels began to revolve, and slowly we moved away from the wharf, headed toward mid-stream, swung half round, and with scarcely a perceptible motion glided smoothly down the turbid river. Now the wheels beat the water with a faster lick, yet so steadily do we move that standing on the upper deck, and looking back at the little city, it seems to be drawing away from us and fading in the distance, while the mighty steamer stands still. After a while the town vanishes from sight, lost behind a bend in the river. Then we come in view of the beautiful little island set like an emerald in the midst of the waste of waters. A border of young cotton woods, with a growth of larger trees in the centre, give it the appearance of being evenly and skillfully terraced.

Westward, and the fairy isle drifts far astern and vanishes from sight. For miles weird forests, the home of the black bear, the panther and the horned boar, stretch away on either side, as far as the eye can reach. Silently the mighty river rolls on, not always within its banks, eating the crumbling shores from one side and piling them up on the other—unceasing and quiet in its flow as the flight of time.

Passing these long stretches of forests, we come occasionally to a plantation with little dorkies playing merrily just on the very brink of the treacherous flood, and, if we are running near shore, jumping into skiffs and dugouts to be "rocked in the cradle of the deep" on the waves the steamer's wheels are raising. If a great many of them don't go to furnish food for the catfish, then there is certainly a special Providence which protects the small Mississippi River nigger.

The river is very full, and it almost seems that a quart of water poured into it at its source would overflow the banks down here. Still the farmers are working away in the hope of a "fall" as serenely as if they were a thousand miles inland.

The Mississippi River is, after all, as our Yankee brethren would say, "a pretty considerable crick;" thirty-two hundred miles long, in round numbers; navigable twenty-four hundred miles, below and above the falls of St. Anthony, forming part of the boundaries of ten States, draining with its tributaries an area of a million and a half square miles, a sort of continental aorta, having for its tributaries fifteen hundred navigable branches. The vast alluvial plain through which it flows has an area of over thirty-two thousand square miles. In some places, almost illimitable forests stretch away on either shore, filled with many kinds of game, and the lakes and lagoons in these forests are stocked with fish, and teem with wild fowl. Its vast littoral plantations produce in rich abundance cotton, corn and cane, and all the fruits of a semi-tropical climate. Fair cities adorn its banks, and crafts of innumerable kinds are upborne upon its broad bosom.

Plowing ahead, we pass dingy steamers having in tow great fleets of coal barges, sometimes running close by them, again leaving them far away on the other side. Pass slowly floating flatboats, whose crews are always cocked and primed to fire a broadside of Billingsgate at you on the least provocation. Pass immense "sawyers," lifting themselves from the seething waters like gigantic saurians, wet and glistening, then plunging out of sight again. We see in some places the tawny waters stirred by some mysterious force below, boiling like huge caldrons, and occasionally breaking in a long wave from the steamer's prow, but there is no sound with it. The mighty river is mysterious and silent, telling no secrets, striving always, in spite of Captain Eads, to keep its mouth shut. Again we pass long reaches of desolation.

The giant guns hang thickly with a funeral drapery of waving moss. Not a sound. Not a sign of animal life, save now and then an egret, with plumage white as the wing of an angel, solitary and alone, flies slowly ahead of the gliding steamer; and once we saw two bald eagles winging their way above the wooded wilderness.

This steaming on through the golden hours of the glorious afternoon, we pass, at sunset, Rodney, with its glittering spires, set like a gem in the green hillside. But we leave it far away to the left, a long bar in front shutting it off from the river.

As darkness comes down over the waste of woods and waters we descend into the luxuriantly furnished cabin that stretches back like a gilded tunnel from fore-castle to stern, bright with the lights from branching chandeliers. But steamboat travel is not what it was in the *ante-bellum* days. Then those chandeliers flashed down on crowds of "fair women and brave men"—brave at the bar and valiant at the board—on a regiment of white jacketed mulattoes, who came and went noiselessly, bearing sumptuous viands and sparkling wines, and waiting on the well-filled tables. After the tables were cleared the merry dancers tripped the light fantastic toe to the sound of the "violin, flute and bassoon." Forward, the planter with plethora pocketbook indulged in a "little" game of "draw," and there the gay gambolier disported himself, and sported with yo sacker. But "Troy and the glory of the Trojans is no more." The crowd is reduced to a score and a half, and the "little" game of draw to one of "five-cent ante," and he of the silver box and the four aces must seek other fields and pastures green.

'Tis true the colored band came out as of yore, and discoursed some sweet music; but there were not enough ladies in the cabin to form a quadrille, and "the elephant had tramped on every pocket book" aboard. So they could not even get up a game to keep up appearances. As the evening wore on we approached Natchez, and at ten o'clock a long row of lights, rising one above another from the river to the summit of the hill, showed us that we were in sight of the town, and had almost reached our destination.

A little further on our steamer sent forth a most diabolical and unearthly yell from its three-barreled whistle, then the little bells tinkled again. The engines stop, and we move slowly up to the wharf. The gang-planks are lowered, and going ashore we run the gauntlet of howling hackmen—dive head foremost into a carriage and we are driven away to the "Marsh House" on the hill. Natchez, like Rodney and Vicksburg, is built on a bluff, at one of the five points where the tertiary hills extend to the river. It was settled by the French under D'Iberville about the beginning of the last century, and takes its name from a noted tribe of Indians who then dwelt here. Thirty years after the town was settled it was totally destroyed by the Indians, who were ultimately defeated and banished. After having passed into the possession of the Spanish it finally became an incorporated city under the United States about the beginning of the present

century. This portion of the country in early times formed part of French Louisiana. The right to the Mississippi Territory was disputed between the French and Spanish, and afterward between the French and English. It was ceded to Great Britain in 1763, and in 1783 fell to Spain as part of Florida. In 1798 Spain relinquished it to the United States.

Many interesting traditions connected with its early history are told, and the site of Fort Rosalie is still pointed out to the stranger. Natchez is one of the loveliest places in the South; but lacks that stir and bustle characteristic of a railroad town. It has only one railroad, that runs somewhere inland—or is to run somewhere—built like the present style of ladies' dresses, narrow gauge. It has no manufactories; but nowhere in the South will you find more evidences of wealth and refinement, as shown by the elegance and taste displayed in the private residences and grounds.

Nowhere will you find better kept streets, better or more imposing public buildings, more handsome and stylish ladies, and last, though not least, nowhere will you find more well-bred sporting dogs. Somebody says: "Show me a man's friend and I will tell you what manner of a man he is." Show me the dogs in a town and I will tell you what manner of people inhabit it. When you see all the dogs in a place mongrels you may be sure there is a very large element of *our* in the population.

Natchez has the handsomest Masonic Temple in the State, a fine Court House, a magnificent cathedral, and an admirably conducted Orphan Asylum. Some pretty churches and many truly elegant private residences, notably the Shields Place, and the Stanton Place, the latter one of the finest residences in the South. Broad streets intersect each other at right angles, shaded by beautiful trees.

Everywhere in the suburbs you see yards and gardens gorgeous with flowers and foliage, and redolent of perfume. Elegant stores and tasty shops, filled with costly merchandise, give to the business portion of the town a city-like air. A beautiful little park, shaded by masses of foliage and richly carpeted with grass, lies in front of the town on the bluff overlooking the river.

From this charming spot you can see the river stretching away on either hand, can look down the chimneys of the houses in Natchez-under-the-Hill. Can see Lake Concordia beyond the river, and the rich plantations in redeemed Louisiana far away to the southwest. It is a magnificent view; river and lake, cultivated lands and boundless forests—far as the eye can reach—spread like a gorgeous panorama before you.

From this bluff perchance the redskinned fire-worshiper marked the coming of the pale faces' boats upon the river. What a charming spot for the Natchez youth to woo the gentle maiden. If she would not let the word be "yes," then he could jump off himself, or better, perhaps, push her off. North of the town stands a dilapidated U. S. Marine hospital, that is now being repaired and renovated by some religious denomination North with a view of making it a Normal School for the education of young colored men for the ministry. Beyond the hospital is the Federal cemetery, beautifully situated and tastefully laid out. The surface of the country is broken hereabouts with deep depressions, called the "Devil's punch bowls." Some of them are one hundred feet deep, and as many yards in diameter. Imbedded in the sloping sides are found the bones of the mastodon.

To an eminent physician, long a resident of Natchez, to whom I here gladly record my obligations, I am indebted for much valuable information relating to this interesting town.

On a high bluff that commands a fine view of the river and surroundings is the site of the Suzette mansion, destroyed during the war, and under the hill not far away is "Brown's Garden," enchanting in its rich profusion of trees and shrubbery and flowers.

"There the young fountains with sweet perfume blow;  
There feathery palms their pendulous clusters hold,  
Like foxes' brushes, moving to and fro;  
There every evening comes the after glow,  
Tipping the leadens with its liquid gold."

South of town near the river is a rectangular wall of brick inclosing a small space of ground, over which, from the swaying branches, long tresses of moss hang solemnly, and the very trees seem bending down in sadness. Within this inclosure, on a plain granite headstone, is the following inscription:

SERGEANT S. PRENTISS,  
Born at Portland, Maine,  
Sept. 30th, 1803.  
Died at Natchez  
July 1st, 1860.

Do not think me a Vandal or a relic hunter when I tell you that from a carved buck's head in my little parlor droops a long festoon of gray moss that once waved in sadness above the grave of him who, living, held all hearts entranced by the power of his eloquence and, dead, leaves the charm of his name an everlasting heritage to the sons and daughters of his adopted state. GUYON.

For Forest and Stream and Rod and Gun.

## LUNGE FISHING AT LAKE MEGANTIC.

ON the 30th of May last I left Sherbrooke by the 4 P. M. International Railway train, reaching Bury, thirty miles distant, about 6, and Lingwick, twelve miles further by stage, at 8 o'clock. My companion was Captain Thomas, of Melbourne, P. Q., one of the Canadian Wimbledon ride team for 1873 or 4, one of the elect for the present year, and one of the best and coolest amateurs with rifle, shot-gun, billiard ball and fish spear I ever met. The fish-spear was in our juvenile days, some twenty-five years since, when large catches were the criterion of a good fisherman, and fishery laws in embryo. Next morning, leaving Lingwick, we reached Winslow, fifteen miles, for breakfast, and having engaged a fresh team, after fifteen miles more of the worst road I ever drove over, reached Megantic Lake about 1 P. M. Our old guide, Andrew Jackson Foster, had engaged to meet us, but as he wasn't on hand we prepared to make ourselves comfortable over a pannikin of tea, some hard-tack and sardines; but before the tea was ready Andrew Jackson rounded the Major's point, three miles distant, and was soon helping us to dispose of our luncheon. He brought us some nice lunge, caught in trolling through the lake, and explained that the rough water in Victoria Bay had caused him to make a slight *detour*—no, he didn't say *detour*, but that's what he meant. After a little delay in packing ourselves and traps all in one boat (the Captain's legs are long and he had to knot them),

we made our offing, steering directly for Major McMillan's summer box, where we unfortunately found the Major, who accepted our invitation to camp with us that night at Rocky Point, four miles further on, so that by dividing crew and cargo we got along nicely, reaching camp quite early. The Major held a position in Edinburgh similar to that of our barrister or solicitor; is a well-educated, well-read, genial companion, served in the Confederate army, but like the immortal Weller, having decided "to retire from life and take a pike," picked up the wreck of his substance, wended his way to Megantic Lake (now his summer retreat), where, by reading and taking an occasional lunge instead of a pike, and in taking which he has a very taking way, he leads a sort of modern recluse life, happy, however, to see his friends when they call, and happier still to oblige a friend when in his power. I shall not forget the kindness with which (last September) he placed his little shanty (Sunnyside) at the disposal of myself, wife and family, and where we made our headquarters for nearly a month. Sunnyside is the most beautifully situated of any spot on the lake shore, fronting on a lovely beach of water-worn quartz and colored gravel. This gravel has been carted to Winslow, twenty miles, to be used for roofing purposes, although lakes and rivers bordered with gravel abound within a quarter of the distance. The Major has displayed great taste in arranging gravel walks through the small patch of cleared ground surrounding his domicile, and the stumps are carefully concealed by bark-boxes of native and other vines and flowers. Rows of the wild red-cherry tree fringe the principal walks, and if you want to see an illustration of the wilderness being "made to blossom as the rose," visit Sunnyside in autumn. The view southerly of the lake, and the continuation of the Green Mountain range in the background, spotted with shadows of passing clouds and the lovely tints of an autumnal foliage, is magnificent, and one in which the lover of nature will constantly see new beauties. I have seen it on many occasions at different seasons, and only to admire it more and more. *Mais revenons a nos moutons*, or, rather, *nos poissons*. We have reached our camp, and—

"Of hemlock boughs have made our couch,  
A bed for coughs and colds ensuing;  
I have some biscuit in my pouch,  
A salmon trout I've caught in trolling"

(or rather old Foster *læs*), with a frying pan full of which, and a kettle of stewed, minced collops, with the usual accompaniments, we gladly satisfy the cravings of the inner man. It is the first meeting of Foster and the Captain since Foster proposed to play "just eleven games of euchre" at our trout pond camp several years since, and a good many old stories have to be revamped and new ones introduced. Andrew Jackson's stories are abundant, good, and generally original; probably because he has lots of time to think them over, although he says he "can't rickellect and tell a story as he used to could." It was late when we spread our blankets, and just before I winked for the last time I heard Foster telling of some place in Vermont where they cut no hay, raised lots of cattle, and manufactured nothing but shingles. He said they put green goggles on the cattle and fed them on the shingle shavings. Next morning the Major left us after catching five or six fine lunge. A Mr. Howard, an Isle of Man clergyman's son, who camped with us the previous night kindly helped us with our traps through the lake and up the Spider and Arnold rivers to our next camp at the outlet of Rush lake. In passing through Moose Bay opposite the residence of Henry Ryan, Esq., we struck a school of trout disporting themselves on the surface, and out of which the Capt. took half a dozen, running one to two pounds each, by throwing and drawing in the spoon (one of Skinner's fluted bait, advertised in FOREST AND STREAM).

Fishermen are proverbial for hospitality, and we can vouch that Mr. Ryan is no exception to the rule, as the occasional supplies of milk and butter of which we were the recipients will bear substantial evidence. We camped at Rush lake until the 5th June, during which time we fished the Arnold and Spider rivers and Spider lake, not catching any more bass and few more trout than we required for camp use. The time, and then only, when a bass is delicious as a pan fish is immediately after he is caught. Having satisfied ourselves that Megantic lake was our "strongest hold" at this early season, we struck camp and pitched our tent near Rocky point; and here I will give you the result of our last three days' fishing, trolling alone: Our catch on the 5th was 20 lunge, 90 pounds; 6 trout, 3½ pounds; total, 93½ pounds. On the 6th, 21 lunge, 103½ pounds; 4 trout, 4½ pounds; total, 108 pounds, and on the 7th, 7 lunge, 25 pounds; 1 trout, 1 pound; total, 26 pounds.

The lake being very rough last day we could only troll for a short time in the morning. Next day we started home with a flour barrel full (about 300 pounds) lunge and trout. We caught several in going down the lake. The spoons used were principally the fluted spoons above referred to, and a rounded oblong spoon, having a bronze scaled convex side with bright brown projecting eye at end and red concave side. I do not know the maker's name. The latter is the best troller for lunge, the fluted next. Mann's Syracuse double spoon, small or medium size, I have found best for trout and the larger size for bass. I like the action of the two hook (Mann's) troller best, as I have generally found the fish more securely hooked. I do not think I ever lost a bass with one unless from broken tackle, and I have caught hundreds in Spider lake in August and September. The largest of our lunge weighed 18 pounds, and the average weight was 4½ pounds. We shall probably visit Megantic and Spider lakes the latter part of Sept., principally for moose hunting, when we hope to be accompanied by our old reliable guide, Andrew Jackson Foster. Since the above trip I have been at St. Leon Springs, north of the St. Lawrence, within 20 miles of which there is capital trout fishing, and of which I hope to furnish FOREST AND STREAM an account at some future day.

Sherbrooke, P. Q., July 20, 1877.

D. THOMAS.

SLAP JACKS FOR CAMPERS.—"Quill Driver" sends from Milford, Mass., the following receipt:

Flour, one small coffee-cupful; Indian meal, 3 small coffee-cupfuls; sugar, 1 tablespoonful; salt, 1 teaspoonful; Horsford's yeast, one measure each acid and soda; the measure comes with the yeast, which is a dry powder. For convenience of transportation, the ingredients may be mixed dry in the above proportions, moistening with water or milk the amount desired for use at any time until the consistency of thin dough is attained. Cook with a well-greased griddle or frying pan.

—Five elephants, belonging to the London show, broke the Sabbath by going in swimming in the Hudson at Poughkeepsie the other day.

## Fish Culture.

### THE CORREGONI.

THEIR NATIVE HISTORY, NATIVE WATERS, ECONOMIC VALUE, AND IMPLEMENTS CONNECTED WITH THEIR PRODUCTION.

No. 24—PART II.

ALL of those Northern States, bordering on the great lakes, have jointly engaged in stocking the lakes with whitefish by means of artificial culture. Michigan is planting annually millions of fry, while Minnesota and Wisconsin are also engaged in augmenting their whitefisheries by artificial means. Ohio has erected a vast hatchery, which is almost exclusively devoted to the hatching of whitefish for stocking Lake Erie. The Empire State is also supplementing the natural process by stocking Lake Ontario largely with whitefish, under the direction of Superintendent Green of the N. Y. Commission. The very atmosphere of that great State is fishy from the energetic labors of an enlightened commission. New York has a large number of interior lakes which are being planted with whitefish, which are found to be entirely at home.

Iowa, too, is coming to the very fore-front of fish culture, and her Legislature, like that of Michigan, appreciates the value of the art, and responds to the calls of her industrious commission with princely appropriations year after year. Her fish officials, supplemented by the labors of the Hon. B. F. Shaeed, Superintendent of the State Fisheries, are dealing with the problem of artificial culture with wonderful success. The lakes of the State are being planted with whitefish, where they take kindly to their new homes. Well may the Iowans feel proud of their State. It is truly a "land of the beautiful," a cognomen bestowed by the red man, who must have understood the full import of the name he employed to describe a land of crystal lakes and beautiful prairies, lying in pristine loveliness between the two broad rivers in the loveliest of valleys. The Iowa commissioners are not only planting their streams with brook trout, but salmon trout—the *Salmo quinnat* and *S. salar* of the Atlantic coast—and shad which they expect to migrate to the Gulf of Mexico and return to those places in the rivers wherein they were cast in their fryhood. The whitefish fever has also reached California, where are many clear lakes well adapted to the production of this fish: gold-renowned and mirrored with sparkling lakes and rivers, whose shingly bottoms scintillate with shining ore, present magnificent natural facilities for fish culture. Attempts to increase the fruitfulness of these inland waters and sea-fisheries have been crowned with success. We would not individualize the efforts of the older States to the exclusion of the youngest born into the fish-cultural guild. Virginia, Kentucky and Georgia, and even Little Nevada, are wheeling into line and addressing themselves to the work of replanting their exhausted and impoverished fisheries. And while we are gratified in recounting the efforts of our people in solving the problem of cheapened food, we hope ere long that the whole sisterhood of States will engage in the practice of this great industry, second only in value in the production of food to agriculture itself. It is proper at this stage to introduce some of the prominent apparatus now in use in fish culture. The "Clark Apparatus," in which trays are used with screens of wire in boxes, has already been described in a chapter in connection with the Coste and other trays, to which the reader is referred. It is alike adapted to the hatching of salmon, brook trout and whitefish eggs. One of the inventions much in use is the "Holton Tray Hatching Apparatus," developed by Marcellus G. Holton, of Rochester, N. Y. (now deceased), assignor of one-half his right to Seth Green of same city. The utility of the Holton trays consists mainly in employing an upward flow of water through layers of spawn upon a series of trays, entering the bottom of the box and emerging from the upper end, thus passing through this series of trays. The bottom of the box holding this series of trays, is like a mill-hopper, giving a space where sediment may settle without detriment to the spawn. The apparatus may be seen, as illustrated, in the Patent Office Report of 1874, covered by letters patent No. 136,834. The invention consists of a wooden box or case made square, and provided with a depression at the bottom for sediment, which may be removed at any time by a discharge pipe. There is a channel formed entirely around the case near the top. The outer walls of the channel are slightly elevated above the upper edge of the case proper. This arrangement permits a gentle overflow from all sides of the tray-chamber, near the bottom of which is arranged a ledge upon which the trays rest. These latter consist of shallow rectangular frames, each of which is provided with a fine wire gauze bottom, upon which the spawn is spread and held during the hatching. There is a suitable metallic or leather strap attached to two opposite sides of the bottom tray, in each case of trays, whereby the whole set may be raised or lowered when it becomes necessary to remove them from the case. Each side of the case has a vertical recess cut to receive these straps. The latter are perforated to correspond to the depth of each tray, and the straps, if made of metal, may be provided with a pin; but if leather straps are used, they may be hooked upon a fixed pin at the upper edge of the case. A pipe conducts the water from the fountain or spring into the bottom of the case, or a water-chamber may be formed entirely across the side of the case, and also across the bottom. The latter construction is rather preferable for all except the first case in each tier, and in fact would not be

objectionable for that. To insure a complete distribution of the upward flowing current of water through all parts of the trays, a deflector is provided, which may be spherical, flat, or of any other shape. The deflector is supported by standards over the jet, which breaks the current and distributes the water more evenly over the trays within the case. The discharge, or trough, conveys the overflow to the descending water channel attached to the next succeeding case. The case can be made of any desired size, but the inventor preferred them eighteen inches or two feet square, and from two to four or more feet in height, according to the amount of fall afforded by the fountain or spring. The cases containing the trays may be arranged in tiers the entire length of the floor of the hatching-house, and the water overflowing from one made to pass into and through the next succeeding one to any desired extent as regards numbers. The method of spreading the spawn is most convenient. The lower tray is suspended, when it is to be filled, in the position occupied by the upper tray. When the case is full the spawn is spread upon it evenly over the surface of the wire gauze in a suitable quantity. The tray is lowered sufficiently, by the straps, to permit the insertion of another tray, which is treated in like manner, and so on until the case is filled. In reversing the process by raising the strap the span of one tray at a time, the young fish can be removed, and the water allowed to flow in, spreading the spawn or removing the fish, without detriment to either spawn or young fish. This plan is intended more especially for winter hatching, in hatching trout or salmon, or for hatching whitefish, or any kind capable of artificial culture. For plates, and a more extended description, readers are referred to the United States Commissioners' Report for 1872 and '73, page 580, *et seq.* To those persons engaged in fish culture on a large scale, the apparatus invented by Mr. John Williamson, Secretary of the California Acclimatizing Society, will be found to be one of the most useful hatching devices invented by the Piscicultural Guild. It is denominated the "Double Riddle Hatching Box." The invention consists of a long trough, six or eight inches deep, and eighteen inches wide inside. This is divided into compartments twenty inches long in the clear. Into each a box holding five trays are placed nineteen and a half inches long, and eighteen inches wide, with a frame three-fourths of an inch thick and one inch wide, with a wire bottom, having eight meshes to the inch, or a greater number of meshes to the inch, if smaller eggs are to be hatched. Each box of five trays will hold 20,000 eggs, and six continuous boxes will hold 120,000 eggs, or twenty-five boxes will hold a half million of eggs. Where more is of importance, this box is certainly very desirable. The compartments holding the trays are of half inch ends and one inch bottoms. The ends are five inches high. The water is made to flow in under the upper end, and out, over the lower end. By this means all the eggs are thoroughly covered by constantly aerated water, and less sediment is deposited on the eggs. The end of each box at the upper end of the trough is made higher than the lower end, to cause the water to flow in at the bottom of each box and out of the top. Of course, persons desiring these patented boxes, or other apparatus, must purchase or otherwise honorably obtain the right to construct and use them. The "Ferguson Jars," invented by the energetic Fish Commissioner of Maryland, are a valuable acquisition to the piscicultural apparatus used for hatching. These jars are made of glass, and are capable of holding two thousand eggs each. The eggs are placed upon circular screens made of fine wire, and the jars are made to contain nine each. Each screen is supported by the handle of the lower screen, and each jar is provided with a tin cover, a larger cylinder than the jar, which excludes the light. The water is introduced at the bottom of each jar by a rubber tube connected with three-eighths inch spicket, over which the tubes are slipped for introducing the water into the jars. The water after coursing upward among the screens passes from the upper edge of the jar through a like glass nipple into a tube, passing downward to the bottom of the next jar, and so on through the whole series. It would seem that this jar from its compactness, and from being transparent, so as to enable the manipulator to watch the progress of hatching and the detection of unimpregnated eggs, commends itself to the entire guild of fish culturists. The hatchings drop through to the bottom of the jar; from thence they can be easily removed to the nursery trough, and emptied without the possibility of injury. "The Druid Hill Hatching House," of Baltimore, the property of the State, with its magnificent appointments, consisting of the most approved apparatus in use, their swift steamer for ready conveyance, and an unfailing supply of water fairly represent the progress of fish culture in Maryland. With her enlightened and energetic commission, and grand natural possibilities, she must soon become pre-eminent in the practice of fish culture. Besides the introduction of the *Salmo gairdneri* of the Pacific coast, and the *Salmo salar* of the rivers and coast of Maine into her inland waters, European carp are now being multiplied for planting in the warmer and sluggish streams of the State. The only report made by the Fish Commissioners since the establishment of the Commission was made during the Centennial year, and it is the most valuable of any yet submitted by States engaged in fish-culture. Combined with the report is a list of marine and fresh water fishes of the State, of great importance to those who are engaged in the study of ichthyology. Messrs. Uhler & Lugger, naturalists, have prepared a descriptive catalogue, so valuable in point of accuracy, that if each State Commission would add like descriptive lists to their reports much desirable information would soon be collected regarding the Ichthyic Fauna of the United States.

Probably no invention since the introduction of fish-culture into our country equals that of Mr. Samuel Wilmot, of New-castle, Canada, as a white fish hatching apparatus. The can, or hatching box, is eleven inches in diameter and six inches deep. Into this are placed 100,000 white fish ova, as soon as taken from the fish and vivified. It is then put into operation by turning a small faucet, which lets in one-fourth of an inch stream of water. All unvivified or diseased eggs are carried away, and the sound ones, without spot or blemish, are left as

perfect as when taken from the fish, aside from the change produced by the process of hatching. Hand-picking is therefore almost entirely done away with. Mr. Wilmot says: "These self-pickers and cleaners, enough of them to hatch five or six millions of whitefish eggs, will save the labor of four or five men daily, and keep them cleaner than it is possible to do with any amount of hand-washing. The practical working of them is all that could be needed." Its use can be secured undoubtedly by buying the apparatus or by the purchase of the right to manufacture and to use. This apparatus is only adapted to the hatching of white-fish. Messrs. Mather and Bell have invented another hatching apparatus in the form of an inverted cone, containing screens which can be suspended or hung in the hatching house by a bracket, the can being supplied with water at the bottom by means of rubber tubing connected with the tank or fountain, and then passing from the top through a like rubber connection, enters the bottom of another and soon through the whole series, more or less. Inventive genius seems to be running in the direction of developing apparatus, such as we have described, and also in the direction of inverted cones like the Bell and Mather apparatus, for the reason that these cases may be so located in the hatchery as to economize space. Mr. Owen Chase and Monroe Green have also invented similar hatching cases, which work on the same principle as those already described. It is quite apparent that inventive genius is destined to achieve as much in the production of labor-saving implements, as in other and older industrial fields. The art as practiced to-day is young. When it shall have become a giant among the great productive industries of our country, its historic pages will be emblazoned with as many achievements in the field of invention as in any of the older circles of human labor. We may look for a wider application of the art of fish culture in the near future, for it is destined to supplement nature in the artificial production of a larger number of species of both marine and fresh-water food-fishes. The present accessories for vivifying ova and hatching will no doubt be supplanted in the near future by other and superior agents. The original plow of agriculture was an uncouth implement, viewed from the standpoint of to-day, and was a representative instrument of field culture when the art was young. So it will be in the coming years of fish culture; the first agents used were hastily improvised and will serve their day, and must be set down as rude instruments, employed when the art was undeveloped. Progress in any art will never stand still. Busy brains and busy hands are ever acting in the direction of abridgment of toil. We are justly proud of the advancement of pisciculture in its first decade of years on this continent. It has achieved a noble success, all honor to those men who first labored for the introduction of one of God's greatest blessings, and bestowed it upon the American people. The first impulse given to the art does not abate "one jot or tittle," but is pursued with constantly augmenting and increasing fervor. To-day the operations of the United States Fish Commission embrace not only a larger field of operations, but commissions in two-thirds of the States are bending all their energies to fertilize every inland stream.

Sandwich, Ill.

NAHUM E. BALLOU, M. D.

TO PRESERVE FISH SPECIMENS.—To preserve fish and similar natural history specimens, hermetically seal them in vessels containing a preparation consisting of one-third alcohol, one-third glycerine and one-third water. To prevent injury from chafing wrap the specimens in thin muslin or other material, or pack with tow. This method was discovered and employed by Mr. J. G. Swan, of Port Townsend, Washington Territory, while acting as Centennial Commissioner, and has received the indorsement of Prof. Baird, who recommends also the addition of a little borax, which brings out the strength of weak spirits. Specimens prepared in this way and sent from Port Townsend, when received in Washington preserved their color and the lustre of the eyes as bright as when taken.

—Three hundred thousand young shad have been placed in the Passaic River below the Dundee dam. They are expected to be fit for catching in about two years.

—Thirty-two States and six Territories have been directly benefited by the introduction of fish into their waters.

—A spoonful of vinegar should always be put into water in which fish are boiled.

## Natural History.

### THE "BOWER BIRD" OF NEW GUINEA.

THE various habits practiced by birds in their daily life, and their often peculiar economy, render our feathered friends, to the observant naturalist, the most interesting of beings. Each family has its own customs; often a genus is known by some especial habit, and not infrequently a species can be recognized by some curious manner it may have of carrying itself among its fellows, or a particular finish it may give to its nest. As I have noticed that among your contributors there are many keen observers of bird life, it has occurred to me that perhaps it may not prove uninteresting if I give an account that has but lately reached Europe of the strange habits of a certain bird in New Guinea, which will read perhaps more like fiction than sober truth, but of its perfect accuracy, there is no reason whatever to harbor a doubt. It has been for a long time known to ornithologists that a certain genus of birds (*Chlamydotis*) existed in Australia which were accustomed to erect structures in the shape of tunnels. These were built of reeds and twigs, and were sometimes a couple of feet, perhaps more, in length. That these could not answer in any way for incubation was evident at a glance, and it was a puzzle for a long time what use they could be put to by a bird. The ground in front of the so-called "bowers" was usually covered with shells of different kinds, bones, and frequently feathers of various colors, generally very bright ones. After patient watching, it was ascertained that the only rea-

son the birds erected these "bowers" was to use them as play-houses, and the little creatures were seen amusing themselves by chasing each other in and through them in a sort of feathered game of "tag," and the shells and feathers were only so much ornamentation to their play-grounds. That they were not nests, was sufficiently proved by finding a proper structure with the requisite eggs, placed by the birds in a tree. Some three years ago, when engaged upon my work on the Birds of Paradise (to which family these "bower-builders" belong), I received from the Director of the Royal Museum in Leyden, Holland, a dull-colored curious-looking bird, which had lately been obtained in New Guinea, and which I at once saw belonged to a genus hitherto unknown. It was evidently a relative of the "bower bird," differing essentially, however, by characteristics not necessary to describe here, and I made up my mind it would also build a "bower," though of course what kind of a structure it might be I could not even conjecture, and besides mentioning my belief I was obliged to publish my book without further details. Within the past three years, however, some very adventurous Italian explorers have been investigating New Guinea, mainly in search of natural history specimens, and one of them, Signor Beccari, found this little brown bird, which I had called *Amblyornis inornata*, and also discovered its "bower." This is a most extraordinary affair, and consists of a perfectly circular cabin, built principally of the dry twigs of an epiphytous orchid (*Dendrobium*), measuring a little over three feet in diameter, and supported by a single central pillar. Before the entrance is a beautiful garden, of rather larger dimensions than the cabin, made of the greenest moss, and ornamented from time to time with brilliantly colored flowers and fruits, such as flowers of a lovely species of *Vaccinium*. This wonderful habit of the bird is so well known to the Malay hunters that it is called *Takan-kabou* or *Gardener* by them. No more interesting fact has been learned in field ornithology for many years, and it is wonderful to know that a bird, for its own amusement, has the instinct and ability to build a house with a central support for the roof, and then the taste to beautify its surroundings with gaily colored flowers. In respect to this particular species it proves two things, that skill is independent of strength, and that one need not be handsome to appreciate beauty, for the bird does not possess a single gay-colored feather in its body.

D. G. ELLIOT.

Paris, France.

SOUTHERN MAMMALS AGAIN.—Letters have already appeared in our columns from writers who took exception to Dr. Rawlins Young's "Notes on Southern Mammals." The New Orleans Times criticizes severely, disputing the notes regarding deer and bear in toto, which called forth the following response from the doctor, which sufficiently explains itself:

CORINTH, Miss., July 12, 1877.

To the Editor of the Times:

Sir.—In your issue of the 9th inst. you take me to task for some alleged inaccuracies in my notes on Southern Mammals, published in FOREST AND STREAM AND ROD AND GUN of a recent date. These notes were gotten up with reference to mammals found in the following named counties in each of the designated States: Lawrence, Franklin and Cobb, in Alabama; Shelby and the counties east, to the Tennessee River, in Tennessee; De Soto and the counties east, to the Alabama line, in Mississippi; Crittendon and counties lying west of it, to White River, in Arkansas. There are a few deer in the counties named in Alabama. They are certainly "very rare" in the designated portion of Tennessee. There are a few in Hardin and McNairy, and they are occasionally found in Hurdeman, on Potter's Creek and Muddy, but there is, perhaps, not a deer, "native and to the manor born," in either Shelby or Fayette. There are deer in De Soto, and a few in Tippah and old Tishomingo. Ten years ago they were numerous in this county, but they have been hunted in season and out of season by every lazy darkey and scalawag who could get a \$3 shot-gun or musket, until they are well high exterminated. "Black bear rare in Mississippi." One was killed fifteen miles from this place in the year 1850, and a stray one was seen near here last summer. "Rare in Mississippi." I am aware thus deer, and bear too, are exceedingly numerous in the great Mississippi-Yazoo delta, albeit I have not seen any of them. *Ursus richardsoni*, that is accommodating enough to "stay in the fields till a small boy can run and inform the manager and let him come down and kill the animal." The stumpy-tailed plantigrades that I have tackled set more store on their lives than do those that dwell in "Sweet Coahoma by the riverside," and always fought long and valiantly before yielding their souls. Even if bear were plenty here, I do not believe that the Circum Corinthian small boy could be induced to stay in the fields and watch for them. The small boy up here is "powerful" afraid of bears. In making up these "notes" I have confined myself to those counties with which I was most familiar, and I believe that on the whole they are correct. If not, send up a "special commission" and we will submit to an investigation.

RAWLINS YOUNG.

[These notes were prepared for the new work of Dr. Coues, which kindly allowed FOREST AND STREAM to publish them in advance, and doubtless had forgotten that they applied only to certain districts of Alabama and Mississippi. We are all liable to errors.—ED.]

REVERSED SHELLS AGAIN.—Our correspondent, Mr. James Lewis, writing from Mohawk, N. Y., says:

"I have seen the shells which induced your correspondent, T. W., of Leesburg, Va., to inquire about 'reversed shells.' The specimens sent by him are, as conjectured by Mr. Gray and myself, a species of *Physa*, probable *P. uvrea*, Lea. I submit this information thinking it may be some gratification to many of your readers to know just what all this matter really means."

[Mr. Lewis has our thanks for this information which admirably supplements that which he has previously furnished.—ED.]

**A PLEA FOR THE KING BIRD.**—Many persons believe that the king bird is a destroyer of the honey bee, and therefore exterminate them whenever seen near the hives. If, after they have slain one of these sprightly, pretty birds, they will examine the crew, they will find nothing in it in the shape of bees; but they will find the insectivorous pests of the bee-hive—worms and bugs only. *Experientia docet.* Two of these birds nested close to "Eagle's Nest" this year, and I have closely watched them and their habits. As a guardian to the poultry yard, the king bird has no equal. I raise a great many chickens, turkeys and ducks—geese I abominate in the tame state. And hitherto the chicken hawks have nearly decimated my stocks, and I have had to keep both shot-gun and rifle loaded all the time to be ready to repel intruders or avenge the loss of my favorites. But this year my king birds have done the work for me. No sooner does a hawk appear in the vicinity than the male king bird, with a shrill cry, starts for him. He soon reaches the hawk's vicinity, and the latter, which cannot avoid its fierce peckings, is only too glad to get away into the thickest of the forest without a chicken dinner. I have seen this done not less than forty or fifty times within six or seven weeks. The little hero follows the hawk until there is no danger of his return, and then comes back to have a glorification with his mate on the apple tree near my cottage. Never again will I pull trigger on the game little king bird. He is a hero among heroes, and I honor his pluck. E. Z. C. JUDSON.  
*Eagle's Nest, July 5, 1877.*

**A MURDEROUS SEA FLOWER.**—One of the exquisite wonders of the sea is called the opellet, and is about as large as the German aster, looking indeed very much like one. Imagine a very large double aster, with numerous long petals of a light green, glossy as satin, each tipped with rose color. These lovely petals do not lie quietly in their places like those of the aster in our gardens, but wave about in the water, while the opellet clings to a rock. How innocent and lovely on a rocky bed. Who would suspect it could eat anything grosser than dew or sunlight? But those beautiful waving arms, as you call them, have another use besides looking pretty. They have to provide food for a large open mouth which is hidden deep down among them, so well hidden that one could scarcely find it. Well do they perform their duty, for the instant a foolish little fish touches one of the rosy tips he is struck with poison as fatal to him a torpedo blast. He immediately becomes numb, and in a moment stops struggling, when those beautiful arms wrap themselves around him and he is drawn into the huge greedy mouth and is seen no more. Then the lovely arms unclothe and wave again in the water, looking as innocent and harmless as though they had never touched a fish. OSOAR SPITZER.

—A correspondent of the Nashville *Rural Sun* describes a woodchuck recently captured near Pinewood, Tenn. "The two lower front teeth are two inches long, and protruded outside, and pressed against the nose when the mouth was closed. One of the upper ones had curved inward and formed an almost perfect ring, the point entering the roof of the mouth and piercing the skull just back of the root of the tooth, where it lapped it, completing the circle, which is one and a quarter inches in diameter. The upper tooth had a similar curve, but came in contact with one of the lower ones, by which it was ground off one inch from the base. The animal was much emaciated, having sustained itself under difficult ties."

Instances of this nature are not infrequent. The teeth of all rodents have a constant lateral growth, requiring constant grinding to keep them of the proper length. When, by malformation or accident, the teeth are so misplaced that they cannot be ground down, they grow to great length, protrude from the mouth, and assume many curious shapes. Often, as in the case here described, they ultimately cause starvation, and gain for the victim a happy reward of dusty immortality upon the shelves of natural history museums.

**RACE BETWEEN A PIGEON AND A LOCOMOTIVE.**—The French police the other day wished to forward as quickly as possible an important document from Dover to London, a distance of seventy-six and one-half miles by the railroad, and seventy miles as the crow flies. It was determined to make a trial of speed between a carrier pigeon and the "Continental Mail Express." The police secured a "Belgian voyager" and the railroad company selected their fastest engine. The pigeon and the train were started at the same moment. The bird immediately rose to a great altitude, for a minute or two circled about, and then took a straight course for London. By this time the train was at full speed, going at the rate of sixty miles per hour—a mile for every minute. The delay of the bird had given the train officials confidence in their own success. But high above them, swept on by the west wind, and guided by its wonderful instinct, the little messenger kept its course, and when the train reached Cannonstreet, London, the pigeon had been there twenty minutes—a time allowance of eighteen miles.

**PENGUINS AT TRISTAN D'ACUNHA.**—An observant writer who has devoted a good deal of attention to that most peculiar specimen of the natatores, the penguin, thus describes the ungainly movements of a flock after reaching the shore from a dip in the heaving billows: "The moving water approaches the shore in a wedge shape, and with great rapidity, a band of perhaps from three to four hundred penguins scramble out upon the stones, at once exchanging the vigorous and graceful movements and attitudes for which they are so remarkable while in the water for helpless and ungainly ones, tumbling over the stones, and apparently, with difficulty assuming their normal position upright on their feet, which are set far back, and with their fin-like wings hanging in a useless kind of way at their sides. When they have got fairly out of water, beyond the reach of the surf, they stand together in few rows drying and dressing themselves and talking

loudly, apparently congratulating themselves on their safe landing, and then they scramble in a body over the stony beach—many falling and picking themselves up again with the help of their flappers on the way—and make straight for one particular gangway into the scrubs, along which they waddle in regular order up to the rookery. In the meantime a party of about equal number appear from the rookery at the end of another of the paths. When they get out of the grass on to the beach, they all stop and talk and look about them, sometimes for three or four minutes. They then with one consent scuttle down over the stones into the water, and long lines of ripple radiating from their place of departure are the only indications that the birds are speeding out to sea. The tussock-brake, which in Inaccessible Island is perhaps four or five acres in extent, was alive with penguins breeding. The nests are built of the stem and leaves of the *Phalaris*, in the spaces between the tussocks. They are two or three inches high, with a slight depression for the eggs, and about a foot in diameter. The gangways between the tussocks, and which penguins are constantly passing, are wet and slushy, and the tangled grass, the strong ammoniacal smell, and the deafening noise continually penetrated by loud separate sounds which have a startling resemblance to the human voice, made a walk through the rookery neither easy nor pleasant.

**A DASTARDLY OUTRAGE.**—Friday evening we enjoyed a visit to the New York Aquarium, at which time a few of the inhabitants of the salt water tanks were in a torpid condition, refusing food, etc.; on the following days, Saturday and Sunday, the number of invalids among the finny tribes increased, until on Monday morning the watchman in charge reported that hundreds of fish were floating on the surface dead, the tanks being almost completely depopulated. During the warm weather the windows on the side of the building toward Thirty-fifth street have been kept open to admit a free circulation of air, and it is conjectured that poison was thrown through these open windows. The work was evidently performed by one familiar with the Aquarium, and the system of circulation and supply of salt water. In addition to the loss of a large amount of money entailed by this wholesale poisoning, it is feared that it will be almost impossible to replace some of the rare species. Among the dead are fifteen valuable sharks, herring and sturgeon. Some time ago two fine and rare sea otters, that had been procured at great expense, died in the Aquarium, having been poisoned by some one unknown. The carcasses were dissected by Dr. Weisse, of Twenty-second street, who found the poison, which proved to have been, then as now, carbonate of lead.

**LION TRAINERS.**—Van Amburgh was one of the most remarkable of lion kings. Perfectly fearless, he was constantly in danger; yet notwithstanding the fact that the newspapers reported him killed over and over again, he died quietly in his bed at last. During his career, menagerie keepers and circus proprietors sought about for lion kings wherever they could find them; and as a demand usually creates a supply, so was it in this instance. Heroes sprang up in various obscure corners, each tempted by the high salary offered. A *solutionum* of ten or fifteen pounds a week is no trifle to a man in a humble station. Crockett, who attained considerable celebrity in this branch of business, won fame not only by his performance before the public, but by an exercise of great courage at a perilous moment. One night the lions got loose. Crockett, to whose lodgings a messenger was quickly dispatched, came and hastened into the arena. The lions were roaring about the auditorium, and had just killed one of the grooms. Crockett went among them, and with only a switch in his hand drove or enticed them into their cage without receiving a scratch. The rumor of this bold and successful achievement brought him offers of an augmentation of salary. A negro sailor, who called himself Macomo, the Africa lion king, also gained a reputation for bravery. He appears to have been a daring fellow, well adapted for the work he undertook. On one occasion an unusually savage tiger, newly purchased, was put into a cage already tenanted by another tiger. The animals began to fight furiously. Macomo, armed only with a small riding whip, entered the cage; both tigers turned fiercely upon him and lacerated him severely; but, covered with blood as he was, he continued to whip them into submission. Not for one instant did he keep his eyes off of them, and they knew it. Macomo had other narrow escapes, but like most of lion kings he died quietly in his bed at last.—*Ex.*

**CURIOUS ANTLERS.** *Tiffin, O., July 8, 1877.*—"Buck-Shot" says: I have in my possession a buck horn that is quite different from any I ever saw: instead of a single spike coming out of the antler next to the head there are two distinct spikes or prongs. Instead of five prongs, it has six. Father killed the deer about forty years ago. He says the deer was short-legged, thick bodied, and weighed about two hundred pounds. If any of the old hunters have ever killed any like it, I should like to hear from them.

[Deer horns vary almost indefinitely in form and number of prongs. We have seen horns of the mule deer (*C. macrotis*) which might have been taken for those of the red deer (*C. virginianus*), although ordinarily the shape of the horns in the two species is very distinct. Specific distinctions based on the horns alone are in the deer apt to be of doubtful value.—*Ed.*]

**THE CUCKOO.**—Here is the Danish reason why the cuckoo builds no nest of her own. When in the early spring time the voice of the cuckoo is first heard in the woods, every village girl kisses her hand and asks the question, "Cuckoo, cuckoo, when shall I be married?" And the old folks, borne down with age and rheumatism, inquire, "When shall I be released from this world's cares?" The bird, in answer, continued singing "Cuckoo!" as many times as years will elapse before the object of their desires will come to pass. But as some people live to an advanced age, and many girls die old maids, the poor bird has so much to do in answering the questions put to her, that the building season goes by; she has no time to make her nest, but lays her eggs in that of the hedge-sparrow.—*Ex.*

## THE FAUNA OF MICHIGAN.

BY ARCHER.

(Continued).

CLASS REPTILIA.

(Adopted from Prof. Miles' report as State Zoologist.)

ORDER TESTUDINATA.

FAMILY TRIONYCHIDÆ.

*Amyda mutica*, Fitz. Confined to northern part of State.  
*Aspiderochelys spinifer*, Ag. Soft-shelled Turtle. "Confined to southern half of Lower Peninsula."—*Miles.*

FAMILY CHELYDROIDÆ.

*Chelydra serpentina*, Schw. Snapping Turtle.

FAMILY CINOSTERNOIDÆ.

*Onchocentrotus*, Ag. Questionable.

*Thyroglossum pennsylvanicum*, Ag. Musk Turtle.

FAMILY EMYDOIDÆ.

*Graptemys geographica*, Ag.

*Gratemys leucostriata*, Ag.

*Chrysemys marginata*, Ag. "The most abundant species in the State,"—*Miles.*

*Emys melleogaris*, Ag.

*Nanemys guttata*, Ag. "Several specimens have been found white agree perfectly with those from Massachusetts, the only difference noticed being the darker color of the plastron in the Michigan specimens."—*Miles.*

ORDER OPHIDIA.

FAMILY CROTALIDÆ.

*Crotaphalus tergovinus*, Holb. Massasaugua.

FAMILY COLUBRIDÆ.

*Entenia savita*, B. and G. Striped Snake. Rare.

*Entenia sirtalis*, B. and G. Garter Snake.

*Nerodia sipedon*, B. and G. Water Snake.

*Nerodia agassizii*, B. and G.

*Regina lebeis*, B. and G. Striped Water Snake.

*Heterodon platyrhinos*, Latr. Blowing Viper.

*Sceloporus vulpinus*, B. and G. "This species is abundant in the Saginaw," according to Professor Miles, and though perfectly harmless, is much dreaded by the inhabitants, who believe otherwise. Prof. Miles also says the Blowing Viper is extremely rare, so far he knows, and gives it in his list on the authority of Prof. Sager. When I attended school in Flint, Genesee County, Mich., in 1860, they were not uncommon in that neighborhood, as plenty of my school-mates who used to go out "snaking" with me can testify. At one time three were obtained in a single afternoon near the asylum.—*J.*

*Ophibolus eximius*, B. and G. Milk Snake.

*Bascanion constrictor*, B. and G. Black Snake.

*Bascanion foxii*, B. and G.

**ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDEN DURING WEEK ENDING TUESDAY, July 21.**—One woodchuck, *Arctomys monax*, presented; one Virginia deer, *Capreolus virginianus*; one white ibis, *Ibis alba*, purchased; three striped lizards *C. sax. lunatus*, presented; one brown lizard, *E. fasciatus*, presented; three chameleons, *A. principis*, presented; thirteen gray lizards, *S. undulatus*, presented; one pig-tail Macaque monkey *M. minimus*, born in garden; one green heron, *Ardea carolinensis*, presented; one moose, *A. pascuensis*, purchased.

ARTHUR E. BROWN, Gen'l Supt.

**ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING AUG 4.**—One squirrel, *Sciurus carolinensis*, presented by Mr. D. Scott, N. Y. City. One ring dove, *Turtur risorius*, presented by Miss. Lambert, N. Y. City. One gannet, *Lula bassana*, presented by Rev. J. Howard Hand, Southampton, L. I. One robin, *Turdus migratorius*, presented by Mrs. Makin, N. Y. City. Two armadillos, *Dasypus septemcinctus*, One Zebra, *Bos indicus*, bred in the Menagerie.

W. A. Conklin, Director.

**STRAY ALBATROSS.**—"Our Harry," of Kingston, N. Y., writes that an albatross, or great gull, as it is sometimes called, was caught on Saugerties Flats, July 18. It proved to be a young bird, weighing six pounds four ounces. It is seldom that these birds are found so far from the sea.

"The Social Science Association holds its annual meeting this year at Saratoga. The opening session is appointed for September 4.

## SPLIT BAMBOO RODS.

To Our Customers and the Public: In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
—[Ado. Manufacturers, 65 Fulton Street, N. Y.

# Woodland, Farm and Garden.

## THE CHARMS OF NATURAL SCENERY.

IN a shady glen or ravine, inviting as it does quiet contemplation, we are often enabled to discern minor objects of beauty, which, under ordinary circumstances, would be passed by unheeded. Here a charming tuft of moss, covered with hundreds of its classical urn-shaped capsules, supported on shining foot stalks; there a tiny bit of wall-rue, mountain spleen-wort or walking fern, spring from the seams of rocks, or grow embedded between the lichen-covered stones, all happy and at home. Rarely indeed has a closer inspection failed to reveal something unexpected—some little treasure that might be taken home as a special souvenir. The impressive grandeur of the rocks—piled in irregular jutting masses—here all but overarching the narrow stream, there anon expanding outward into a sort of graduated series of irregular and abrupt terraces; associated and contrasted with the finely developed fronds of the ferns, could not fail to enchant all lovers of the romantic. Under the subdued light—moistened by the trickling drops that filter through the rocky crevices, and sheltered from the drying winds—many of our most charming plants find a fitting and congenial home, in which they frequently enjoy a magnitude of development that almost leads one to question their specific identity. What lovely masses of moss festoon the face of the jutting rocks!—and deep beneath, in the dark corners grow the marvellous and other lichens, stealthily but surely performing their own infinitesimal part in the gigantic work of disintegration that is continuously in progress. Then, again, what an additional interest do the tortuous roots give rise to, as they twist and twine in search of their scanty food, inserting themselves into every crack and crevice, and gradually growing in thickness, till they become gnarled with age, and in their growth assert the vital power of organic over unorganic nature, by displacing, at times, large fragments of rock into the stream below. Seeing then that these ravines have an especial beauty and constitute a marked characteristic in our natural scenery, the question suggests itself, or ought to suggest itself, to every possessor of a country home, is there any wild corner that could by a little skillful manipulation be metamorphosed into a ravine? Any attempt to imitate nature on a large scale must necessarily be attended with considerable expense in the matter of labor alone, independently of the cost of massive blocks of rock, old roots, etc.; but there are gardens in which nature has provided the necessary elements to form the ground work, and it may not be out of place here to give a few hints by which the amateur may be assisted in the selection of such plants as are best adapted for beautifying the ground work already formed to his hand. Where such a ravine is traversed by a stream and overshadowed by trees, few plants are more at home than the great majority of our hardy ferns. Chief among them the various flowering varieties, *Osmunda*, *Cinnamomum*, *Speckleback* and *Intermedia*, with the ostrich plumed *Struthiopteris*, *Pennsylvanica* and *Germanica* claim the prominent places, closely followed by broad and massive groups of *Oncoclea sensilis*. The various *Phegopteris* with their delicate fronds should have a shady nook; *Polypodium vulgare* may cover a partially shaded rock; the curious and interesting walking fern (*Climacopteron*) will be at home in a damp and mossy location; the climbing fern (*Lygodium*) will grow and flourish in a moist, grassy, shady spot; while the various *Aspleniums*, *Aspidiums*, *Woodlands*, the exceedingly graceful and sweet-scented *Dicksonia*, and even the *Lycopodiums* (*Club-mosses*) and *Selaginellas* will peep from many a nook, and give added interest to every step. But in addition to these fairly bowers of ferns, there are many of our native flowering plants as well as of the cultivated herbaceous varieties that will add greatly to the beauty of such an arrangement. For creeping plants to cover damp soil and form natural draperies none are better suited than the common *Moneywort* (*Lysimachia nummularia*), and its golden-leaved variety, the *Sibthorpia* Europea, and the golden *Chrysosplenium* also dearly love a damp locality. The twin-flowered *Linnaea borealis*, the early *Hepaticas*, *Thalictrum*, *Decentras*, *Wood Aromones* and violets; the rosy *Oxalis*, all the *Trilliums* and *Epimediums*, *Dodecatheon*, *Trientalis*, *Hypoxis* or *Stargrass*, *Aldenlandia* (*Bleets*), *Aquilegias*, not neglecting the new golden *A. Chrysantha*, and hundreds of others, will naturally find a proper situation, while over them will wave the lovely *Solomon's Seal* (*Polygonatum*), the *Baneberry* (*Acea spicata*), with its cherry red or white berries, the *Bug-bane* (*Cimicifuga*), the feathery plumes of the *Smilacina racemosa*, the various *Lilies*, *Cypripedium*, *Habenarias*, *Uvularias*, *Irises*, and many taller growing plants, which, if given plenty of rich soil, will grow and flower with a vigor almost surprising. High among the rocks, and in the more exposed situations, can be planted the graceful *Adiantum cilirostris*, with its clusters of fringe-like flowers, the lovely *Clematis Virginia*, or its sweet-scented congener, *O. Flammula*, the violet-scented *Apios tuberosa*, the golden-leaved *Honeysuckle*, for the contrast of its foliage, or the golden-berried *Celastrus*, or *Bitter Sweet*, so ornamental in the fall; even the American Ivy (*Ampelopsis*) and kindred vines in graceful festoons can all be brought, with the wild elegance of their growth, to lend an additional charm to the scene.

**THE NEW YORK HORTICULTURAL SOCIETY.**—We have much pleasure in mentioning that we have received the corrected schedule of premiums offered by this enterprising society for their fall exhibition, to be held at Gilmore's Garden Sept. 26 to Sept. 28 inclusive. In this, probably the finest hall in the country for such an exhibition, and as the premiums offered are very liberal, we feel assured that the exhibition will surpass even that of last season, and would advise all interested in horticultural pursuits to be sure to attend it. Any one wishing a copy of this schedule, or of the constitution and by-laws of the society can have it by return mail by addressing to the recording secretary, W. J. Davidson, 258 Fulton street, Brooklyn.

## ROUGH NOTES FROM THE NORTH-EAST.

HALIFAX, N. S., July 22, 1877.

### EDITOR FOREST AND STREAM:

Cool and bracing, even in summer, is the breeze that blows fresh from the broad Atlantic upon the bold Acadian shore. That Arctic current which pours down its icy waters through Davis' Straits upon the northern coast of Newfoundland, bearing upon its bosom the dreaded bergs which float onward to the western confine of the noted Gulf Stream, sends one of its errant outlets southward to wash our granitic shores; and it is to this cool current that we owe our charming summers, the like of which no other land can boast of the wide world over. When you, Mr. Editor, and other worthy citizens of the western world's metropolis are sweating under the influence of a temperature which overheats the system and exhausts the frame for weeks—may we not say months?—the inhabitants of this favored land can enjoy the luxury of a daily walk through an atmosphere reduced to within a few degrees of temperate by the vast refrigerator we have alluded to. 'Tis true, we cannot boast much of our spring; the months of April and May are generally "broken," as it is termed—one day may be calm, clear and warm, while the next may be boisterous, gloomy and cold. At that season, also, we are liable to dense fogs—at least that portion of our province which lies along the Atlantic shore—and these fogs are the result of the contact of the cold northern current with that of the Gulf Stream. Our summer, therefore, cannot be said to commence before the middle of June, although some charming weather does occur even in May, on the last day of which month, some six years ago, I well recollect the extremely high temperature of 91° in the shade being recorded.

The city of Halifax, with which locality and its fauna I am more acquainted than with other parts of the province, is situated upon a peninsula running nearly north and south, bounded on its eastern side by the waters of perhaps the finest harbor North America can boast of, while on the west it is lavied by those of the placid lake-like inlet known as "The Northwest Arm." The highest portion of the peninsula is Citadel Hill, on which Fort George is built, and from which a splendid view of the entrance to the harbor and surrounding country may be obtained. It may possibly reach the height of 200 feet above the sea level, but I should think hardly more. In every part of the peninsula the soil is much the same—poor and shallow in its natural state, and resting on a sub-soil of hard pan clay, mingled with the rounded masses, large and small, of granite and slate stone, so characteristic of the well-known "boulder drift." As may be expected, the land on the peninsula, poor and hungry as it is, is found to be profitable under cultivation so near to a large town, and therefore but a small portion remains in its original wild state. At its southern extremity lies a tract of this wild land, about 300 or 400 acres in extent, known as Point Pleasant, a charming district, now laid out with walks and drives for the citizens to take their pleasure in. The spot is truly wild in every respect; a mass of rock, more or less chaotic, everywhere clothed with a dense growth of dwarf spruce (*Abies nigra*, Poir.) in its three varieties of black, red and white, interspersed with *Juniperus*, though picturesque, examples of the white or Weymouth pine (*Pinus strobus*, L.). Diving into the recesses of this wilderness, the botanist will light upon many a shrub and plant wherewith to adorn his herbarium. Beneath the sombre shade of those gnarled and knotted pines, in spring time blooms the May-flower (*Epilobium repens*, L.), and in early summer in profusion grows the little twin flower (*Linnaea borealis*, Gron.), whose lovely, pendulous blossoms never fail to attract the attention of the most inquisitive eye, while numberless shrubs, including the crimson lambkill (*Kalmia angustifolia*, L.), the purple rhodora (*R. canadensis*, L.) and Labrador tea (*Saxifraga latifolia*, Ait.), help to fill up every vacant space, save where an open grassy spot occurs like an oasis in this desert of conifers, marged around by the dwarf, yet dense foliage of the humble blueberry (*Vaccinium pennsylvanicum*, Lam.).

It is not only in summer that this locality is pleasing to the lover of nature, for even in the depths of our long and severe winters when the snow storm is raging in all its fury and the trees are bending to the passing gale, it is pleasant to roam through these solitudes and listen to the faint note of the black-capped titmouse and Hudsonian chickadee, which appear to heed not the piercing northern blast, but pass onward from tree to tree, busily searching each moss-grown branch for the insect food which hibernates within.

Such briefly is Halifax and its immediate surroundings; other spots there are, 'tis true, well worth describing, but as the readers of *FOREST AND STREAM* may weary of my account, I shall refrain for the present, at least, and pass on to cull a few items from my note-book.

**Portuguese Man-of-War** (*Physalia*).—Among the Southern forms brought to our coast by the Gulf Stream is the Portuguese man of war, and its occurrence generally takes place during the month of August or beginning of September; sometimes a little earlier, as in July, 1866, when a specimen was taken in our harbor on the sandy shores of Sable Island, which lies some eighty miles off shore and much nearer the Western edge of the Gulf Stream; it is not uncommon at that season of the year.

**Earthworm** (*Lumbricus*).—I observe sometimes when walking along our streets during the early summer months after a heavy rainfall an unusual number of earthworms lying dead above ground. What can have been the cause of so much wholesale destruction?

[The earthworms come up from the dry ground beneath to get the moisture, and obtaining too much water, are drowned. An earthworm will drown in a bucket of water in half an hour or less.—Ed.]

**Wild Strawberry** (*Fragaria virginiana*, Ehrh.).—In ordinary seasons this plant, which is very abundant in most parts of the country, expands its leaves about the last week of April, and I have observed it in bloom as early as May 12. The fruit ripens about the middle of June, although some may be picked a few days earlier. From the end of June to the middle of July the market is plentifully supplied. The usual mode of exhibiting the fruit for sale is in little trays made of the bark of the paper birch (*Betula papyracea*, Ait.), holding usually about a pint of berries, and these "barks," as they are called, sell when the fruit is abundant at about seven or eight cents each. Heavy rains have a bad effect upon our wild strawberry supply, as it is a fruit which soon decays under moisture when fully ripe.

**Whiteweed** (*Leucanthemum vulgare*, Lam.).—One of the most common weeds to be seen in our cultivated fields, especially meadows, is the white weed, or ox-eyed daisy. The hay crop in some places about Halifax is more than half composed of this plant, yet farmers declare they have no objections to it, as the cows are very fond of it, and being bitter in taste it probably acts as a tonic.

N. B. Mac.

—Sir Richard Wallace, an English country gentleman, has planted so many rhododendrons on his estate in Suffolk this season that they may almost be reckoned by the mile. They are expected to afford a beautiful sight next spring.

—The roof of the Palmer House, Chicago, has been converted into a magnificent conservatory.

## WILDWOOD POISONS.

FORT DUNCAN, Texas, July 23, 1877.

### EDITOR FOREST AND STREAM:

A communication, signed "Jacobstaff," in your issue of July 12, and your editorial remarks thereon, have excited my interest and attention, having been many times the victim of wildwood poisonous vines and shrubs, and having learned from Indians and Mexicans certain remedies used by them for the poison of the Ivy and poison oak, so common throughout our entire Western domain, I venture to offer a suggestion or two as to remedies, and hope your correspondent, as well as some of his readers, will try one of them for the poison of the black alder as well as of the Ivy.

The two remedies I just mention are not of those before stated, as in use by Indians and Mexicans, but are the result of a study by several army surgeons of the effect of these Indian and Mexican remedies, and substituting therefor certain chemicals of similar character.

The first is a strong solution of nitrate of potash applied frequently to the parts affected. The best way to apply is to keep bandages of linen saturated with the solution, on the parts. When this cannot be had, use gunpowder made into a thin paste with milk or water.

The other is a solution composed of zinc oxide, two drs.; acid tannic, thirty grains; cosmoine, plain, two drachms. Apply same as other solution. Both are certainly excellent antidotes for the poison of Ivy and the poison oak, and may be equally so for the black alder.

WESTERN SPORTSMAN.

**WOODLAND POISONS.**—Another correspondent sends an additional remedy, as follows:

As there has been a great deal said lately in *FOREST AND STREAM* and *ROD AND GUN* about poison Ivy, or, as we call it, poison oak, I send you a sure remedy for it: The yolk of one egg boiled hard, made into a paste or ointment, with a tablespoonful of good fresh butter (not salted); apply to the parts affected. The above is not impaired by age, or becoming rancid, but is rather improved. I can testify to the good results from use of the above remedy, for I have never known it to fail.

—The dried plants received last week were all correctly named, with the exception of the *Matricaria*, which we think is *Maruta cotula*. The unnamed species is undoubtedly *Troximon cuspidata*, Pursh., a native of our Western prairies. Would our correspondent be kind enough to give location and date of collecting in future if practicable?—Ed.

—The Society for the Prevention of Cruelty to Animals offers a prize of \$500, to be awarded Aug. 1, 1878, to the person or persons who shall have done the most to lessen the sufferings of animals in transportation by rail during the year which will end July 1, 1878.

**SOOT AS A FERTILIZER.**—To strong growing greenhouse plants, such as pelargoniums, fuchsias, roses, carnations, chrysanthemums, azaleas, solanums, and many others, soot is a valuable and easily obtained stimulant. A handful of it tied in a bag and stirred in a three-gallon can of water, has a marvelous effect on all the plants just named, and on many others besides. It induces vigorous growth, and adds freshness and substance to both leaf and flower. It is better to use it in small quantities and often, rather than charge the compost with more carbon than the plants can readily assimilate. For the more robust growers, especially if grown in small pots, mixture with fresh manure from the cow shed is desirable, but this mixture should be allowed to settle before using, otherwise the grassy particles will remain on the surface of the pots, and while giving them an unsightly appearance, exclude that free aeration which all healthy roots require.

**DESTROYING PLANT INSECTS.**—At this season of the year aphids and thrips are apt to be very troublesome, and, from the fact that many green-houses attached to villa residences are badly constructed, an effectual fumigation by means of tobacco smoke in the ordinary way becomes somewhat difficult. My own house is a case in point. The roof is so loosely constructed that the smoke passes away through the openings before the insect pests are destroyed. I am therefore led to adopt a plan of my own. Once a week I put some soft soap and flowers of sulphur into four gallons of soap-suds, mixing all well together. The next process is to turn the plants heels upward and immerse their heads in the soapy solution; but before doing this, I prepare a circular piece of stiff card with a hole half an inch in diameter, and a slit reaching from the central opening to the circumference of the card. This is then stretched so as to allow the stem of the plant to be surrounded, and by pressing the fingers of the left hand firmly against it and to the rim of the pot when the plant is turned upside down, no soil can fall into the mixture. By gently moving the head of the plant backward and forward in the solution, the leaves become cleansed of insects, and as a kind of soapy glass clings to the leaves after they are dry, insects do not quickly infest them again.—*The Garden*.

**AQUARIUM CEMENT.**—Mix together litharge and glycerine to the consistency of thick cream or fresh putty. This cement is useful for mending stone jars or any coarse earthenware, stopping leaks in seams of tin pans or wash-boilers, cracks and holes in iron kettles, etc. I have filled holes an inch in diameter in kettles, and used the same for years for boiling water and feed. It may also be used to fasten on lamp-tops, to tighten loose nuts, to secure loose bolts whose nuts are lost, to tighten loose joints of wood or iron, loose boxes in wagon hubs, and in a great many other ways. In all cases the article mended should not be used until the cement has hardened, which will require from one day to a week, according to the quantity used. This cement will resist the action of hot or cold water, acids and heats.—*N. Y. Tribune*.

**ROSE SLIPS.**—Never cut a lateral shoot from a rose bush, if you wish to propagate it, but break it off quickly with a downward motion. It will then retain a minute portion of the older branch; the fracture will be rough and send out rootlets more readily. Make your soil very wet, like thick mud, and keep it so. Your rose slips planted in this way should root in three weeks.—*Rural New Yorker*.

THE AMERICAN POMOLOGICAL SOCIETY holds its meeting this season at Baltimore, commencing Wednesday, Sept. 12th, at 10 A. M., and continuing three days. All Pomological, Horticultural, Agricultural and kindred societies in the United States and British Provinces are invited to send as large delegations as they may deem expedient, and all persons interested in the cultivation of fruits are invited to be present and take seats in the convention.

This coming session is expected to be unusually interesting from its location in the great fruit growing region of the Atlantic coast, and from the varied experience embodied in the reports of the State and local horticultural societies to be presented. The Maryland Horticultural Society will, at the same time, hold a grand exhibition of fruits, plants, flowers and vegetables, which will give increased interest to the occasion.

Packages of fruit, with the names of contributors, may be addressed to the American Pomological Society, care of W. B. Sands, Baltimore, Md.

**TO KEEP MEAT FRESH.**—As soon as the animal heat is out of the meat slice it up ready for cooking. Prepare a large jar by scalding well with hot water and salt. Mix salt and pulverized saltpetre in the proportion of one tablespoonful of saltpetre to one teaspoonful of salt. Cover the bottom of the jar with a sprinkle of salt and pepper. Put down a layer of meat, sprinkle with salt and pepper the same as if just going to the table, and continue in this manner till the jar is full. Fold a cloth or towel and wet it in strong salt and water in which a little of the saltpetre is dissolved. Press the cloth closely over the meat and set in a cool place. Be sure and press the cloth on tightly as each layer is removed, and your meat will keep for months. It is a good plan to let the meat lie over night after it is sliced before packing. Then drain off all the blood that oozes from it. It will be necessary to change the cloth occasionally, and take it off and wash it—first in cold water, then scald in salt and water as at first.—*Ex.*

**PRESSED LEAVES AND FLOWERS FOR WINTER.**—Jack-in-the-Pulpit, in the August "St. Nicholas," gives some hints for preparing leaves and flowers for home decoration. By the exercise of very little labor, and without any expense rooms may be thus rendered wonderfully cheerful for the long winter months:

The Little Schoolma'am's plan is to take a sheet of thin cotton-batting, and lay the flowers carefully on it, covering them with another sheet, and then putting the whole under slight pressure. Sometimes, when the flowers are thick, and contain a good deal of moisture, she puts them in fresh cotton the next day, and after that does not disturb them. But in pressing nearly all the small flowers, the cotton need not be changed at all, and not even opened until the flowers are preserved. I noticed that the Little Schoolma'am pressed flowers had a soft, bright look. She groups the long-stemmed ones prettily in vases, or lays them between sheets of thin glass, and hangs them in her windows in the winter, she says. They haven't at all the poor, pinched, faded, flattened look of flowers prepared in other ways. The Little Schoolma'am presses green leaves and ribbon-grass in the same way, keeping their color perfectly, and she told the children that when they wanted to pile a number of these double cotton layers together, it was better to lay a sheet of blotting paper in between the sets. Sometimes she lays tissue paper between the flowers and the cotton; but it is of the thinnest kind.

—House plants ought to be stimulated gently once or twice a week. Rain water, so refreshing to summer flowers, always contains ammonia, which also abounds in all liquid manures. If you take an ounce of pulverized carbonate of ammonia, dissolved in one gallon of water, it will make spring water even more stimulating to your plants than rain water. If you water your plants once in two weeks with guano water (one tablespoonful to a pail of water), they will grow more thrifty. Chicken manure dissolved in water is excellent. Always keep the soil in your flower pots loose. A common hairpin used daily will stir the earth sufficiently.—*Boston Journal of Chemistry.*

**THE RAIN TREE.**—In the woods adjacent to the city of Moyobamba, Peru, exists a tree called by the natives Tamai-caspi (rain tree) which possesses some remarkable qualities. It is a tree of about fifty feet high when at maturity, and of about three feet in diameter at the base, and has the property of absorbing an immense quantity of humidity from the atmosphere, which it concentrates and subsequently pours forth from its leaves and branches in a shower, and in such abundance that in many cases the ground in its neighborhood is converted into a perfect bog. It possesses this curious property in its greatest degree in the summer, precisely when the rivers are at their lowest, and water most scarce; and the writer proposes that it should be planted in the more arid regions of Peru for the benefit of agriculturists.—*Panama Star and Herald.*

—Senator Dorsey is taming buffaloes on his new Mexican ranch.

**ANTLERS, ETC.**—Collectors may obtain the following superb specimens at a fair price, by addressing this office.

One pair moose antlers, 16 prongs, mounted; one large pair yak horns, joined at base; one pair Texas horns; one bare head of mule deer, with antlers, ten prongs, mounted; one pair antlers and head of red deer, mounted; one upper shell of sea tortoise, large; one do., land tortoise; one alligator's head, mounted, fine white teeth; one large clear and white shark's jaw; one walrus snout, mounted; one large swordfish; four large swordfish do.; one pair buffalo horns, highly polished and joined; one pair caribou antlers (female) even, fair sized and unmounted; two pair red deer antlers, mounted.

The above are fine specimens, which will be presented to Cambridge Museum if not quickly disposed of.

**SAFETY REIN HOLDER.**—The neatest thing that has come to our notice is the Safety Rein Holder. It can be attached to any carriage, clasps the reins without fuss or trouble, and holds them securely. To physicians we especially recommend it. We know how it is ourselves, and would not be without one for three or four times its cost. It is neat, easily adjusted, saves time, and prevents accidents. —*See Ad.*

—Mere glitter and lip service deceive for a while, but in the long run fall in their influence. People learn to see beneath the seeming. But B. T. Babbitt's Toilet Soap is precisely what it claims to be, the purest and sweetest of toilet soaps, invaluable in the nursery, and consequently the best article for "children of a larger growth."—*Ad.*

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### CANINE THERAPEUTICS AND PATHOLOGY—Fifth Paper.

#### ANATOMY OF THE DOG COMPARED WITH MAN.

WE come next to those organs that serve to secrete and excrete urine, and are likewise essential to the reproduction of the species. The kidneys are situated much in the same way as in man, but are of more globular form, and unprovided with fat on their anterior surface. This difference is easily accounted for when we compare the situation and posture of the two. In the dog they are placed in the inferior part of the body, so as not to be subject to the pressure of the viscera, which seems to be the cause of the deposit of pinguedo in the biped; hence there is no need of any cellular substance to ward off pressure. The superior portions of the canine kidneys are, however, well supplied with adipose tissue, lest they should suffer any compression from the action of the ribs and spine.

In the internal structure of these organs there is considerable difference. The *capitula* do not here send out single the several *tubuli uriniferi*; but being all united, they hang down in the form of a loose pendulous flap in the middle of the pelvis, and form a kind of septum medium, so that a dog has a pelvis formed within the substance of the kidney. The only thing that is properly analogous to this in man, is that sac or dilation of the ureters formed at the union of the *ductus uriniferi*. The external part of the canine kidney closely resembles one of the lobes of that of the human foetus. But in the human adult, from the continual pressure of the surrounding viscera, the lobes—which, in the foetus, are quite distinct and separated—coalesce, though the original cortical substance is still preserved in the interior. The reason of these peculiarities in the dog are probably that the fluids of the animal—as of all the carnivora—being much more acid than those that live on vegetable food, its urine must incline to alkalescence, as indeed is proven by test and smell of that secretion in cats, leopards, dogs, etc., being fetid and pungent, and therefore not proper to be long retained in the body. For this end it is proper the seceding organs should have as little impediment as possible by pressure, etc., in the performance of their functions; and for that design the mechanism of the canine kidney seems to be elegantly adapted.

The *glandulae* or *capsula atrabiliarie* are thicker and rounder for the same reason as the kidneys. The ureters then, are more muscular because of the unfavorable passage the urine has through them, they entering the bladder at the fundus.

The bladder is much the same shape in all quadrupeds, being pyramidal or pyriform. Its difference in shape from man arises from the fact that the neck, from which the urethra is continued, is higher than the fundus; the urine, therefore, must distend and dilate the most depending part by its weight. It is fastened to the abdominal walls by an extension or process of the peritonium, which membrane is extended quite over it. As a rule, carnivora have the bladder more muscular, considerably stronger, and less capacious than the herbivora—such as horses and cattle, whose viscus is perfectly membranous, and very large. This is wisely adapted to the nature of their food, for with the former the secretion is so acid, that we may naturally believe that its removal might be attended with ill consequences, and hence demands to be quickly expelled. This is chiefly effected by its stimulating its receptacle to contraction, and consequent discharge of contents, though the irritation does not depend upon the stretching, so much as the peculiar qualities developed by the secretion itself. That stimulus is one of the principal causes of the excretion of urine is evident when we remember that saline diuretics are dissolved into the semen of the blood, and carried down by the kidneys to the bladder. The same appears likewise from the application of cantharides, or even without medicines, where the parts are sensitive, as from excoriation. Accordingly we find that canines micturate much more frequently than man and other animals with whom vegetable food constitutes the greater portion of their diet. From the acidity of the secretions of the carnivora, particularly the dog, the old writers attempted to account for rabies. The argument was this: that if these animals whose secretions have a tendency to acidity or putrefaction are exposed to heat or hunger, the small portions that would not be excreted—it being claimed that unless new supplies were furnished that all excretory matter would not be voided—would be absorbed into the circulation, poisoning the blood and—to quote an old writer—"the fluids become more and more acid, by which the creature falls into feverish and putrid diseases; and, in fact, we find that fatal and melancholy distempers, as rabies canina and vulpina frequent these animals, whereas those that feed on vegetable food seldom or never contract those diseases but

by infection." At about the time these ideas of rabies were being sown broadcast, one Dr. Heysham took up cudgels in opposition to this theory, and wrote a pamphlet in the defense of one, equally as ridiculous to our modern eyes, entitled, "The Cause of Rabies not Putrescency, but Acidity of the Fluids."

The spermatic vessels are within and covered by the peritoneum, from which a membrane analogous to the mesentery hangs loose and pendulous in the abdomen, unlike man, where they are contained in the cellular structure of the peritoneum, which is tersely stretched over them. At this passage out of the lower abdomen there appears a simple perforation or ring, precisely like that of the human foetus. This opening leaning down to the testicles, which is of no disadvantage to the quadrupeds would have been of great inconvenience to the erect biped, as, from the weight of his viscera, continually gravitating upon these openings, would put him in perpetual danger of enterocoeles, and man is subject enough to hernia as it is. This, dogs are no way in danger from, since in their horizontal position, this passage is in the highest part of their abdomen, and the viscera can not press upon the apertures; and even to prevent the slightest hazard, each is classed by a loose semilunar flap of fat, which not only prevents the intestines from engaging in the passage, but does not allow the vessels themselves to be constricted. Even in the most emaciated animals this remains intact. Again, with a similar condition of affairs in man, the constant dripping down of the secretions of the omentum would have caused man to suffer with a perpetual hydrocoele; but the posture of this animal secures him from anything of the kind, though very fat lap dogs, who consequently have an overgrown omentum, are sometimes troubled with an epiplocele or hernia.

The scrotum is not pendulous as with man, that the secretion at each copulation may the sooner be brought from the testes, thus in some measure supplying the place of the *vesicula seminales*, which are wanting in all canines; the course of the semen through the *vasa deferentia* is thus shortened by placing the seceding vessels nearer the excretory organs. Perhaps its passage is likewise quickened by the muscular power of the *vasa deferentia*, which is much stronger than in the human. This want of *vesicula seminales* also explains why the sexual act is so tedious with the dog; but why they are absent in this animal more than in others is a circumstance which we are unable to explain.

The structure of the testicles is the same as man, as are likewise the *corpus pyramidale varicosum*, or pampiniforme, and the *epididymis* or excretory vessel of the testicle. The *vasa deferentia* enters the abdomen where the blood vessels come out, and, passing along the upper part of the bladder, are inserted a little below the bulbous part of the urethra.

The *præputium* is provided with two muscles; one arising from the sphincter ani is inserted all along the penis, and is known as the *retractor præputii*, which sufficiently explains its office; the other takes its origin from the muscles of the abdomen, and rather appears to be a product of the tunica carnea, and is cutaneous; its use is the opposite of that of the *retractor*. The *corpus cavernosa* rise much the same as in the human, but soon terminate, the rest being supplied by a triangular bone. There are upon the penis two protuberant, bulbous, fleshy substances, resembling the glans penis in man, at the back of which are two veins; are compressed by the erecators penis and other parts during coition, and the circulation stopped, the blood distending these bodies. After the male organ is thus swollen, the vagina of the female, by its contraction and swelling of its corpus cavernosum, which is considerably greater than in other animals, grips it closely, so that the male is kept in action for some time whether he will or not, till time be given for bringing the semen necessary for the impregnation of the bitch; and thus, by that *orgasmus veneris* of the female organs, the want of vesicular seminales is supplied.

But as it would be a very uneasy posture for the dog to support himself solely upon his hinderfeet, and for the bitch to support the weight of the dog for so long a time, therefore, as soon as the bulbous bodies are sufficiently filled, he gets off and turns averse to her. Had, then, this penis been pliable as in other animals, the urethra must of necessity have been compressed by twisting, and consequently the course of the semen interrupted; but this is wisely provided against by the canal being placed in a groove excavated in the inferior surface of bone. After the emission the parts become flaccid, and the circulation is restored, when they are easily extracted.

The prostatic is proportionately larger than in the human, and divided into two, and secrete a greater amount of fluid. The uterus of multiparous animals is little else than a continuation of the vagina, only separated from it by a small ring or valve. It bifurcates, forming two long canals, which mount upon the loins, in which the offspring are lodged. These are divided into different sacs, which are strongly constricted between each foetus, though these constrictions give way when gestation is completed and birth begins.

We next examine the thorax and its contents. But it may not be amiss to remark of the diaphragm in its natural situation, that it is in general more loose and free than with us, its connections being altogether different. The human diaphragm is attached to the pericardium, which again, by the intervention of the mediastinum, is tied to the sternum, spine, etc.; but in this animal there is some little space between the diaphragm and pericardium. We observe further that its middle part is much more moveable, and the tendinous portions are not so large, and it is necessary that the diaphragm should be somewhat loose, the dog making greater use of it in respiration than man. This we may observe by the strong heaving of the flanks after violent exercise.

The disposition and situation of the *mammarie* vary as they bear one or more young. Uniparous animals have them placed between the posterior extremities, which in them is the highest part of their bodies, whereby the young obtain nourishment without the inconvenience of kneeling; nevertheless, when such animals are of no great size and the *mammarie* large, as in sheep, the young are obliged to assume this position. Multiparae are supplied with a number of teats, that their sev-

oral young may have room at the same time, hence they are disposed over both thorax and abdomen; such generally lie down when supplying their offspring with milk, in order to afford them the most favorable situation. From this it does not seem to be from any particular fitness of the parts that the breasts are placed as we find them in the human race, but rather from that of the situation being the most convenient both for mother and infant.

The sternum is very narrow, and consists of a great number of small bones, moveable every way, as is always the case with animals that have great mobility of the spine. The ribs are straighter and by no means so convex as in man, whereby in respiration the motion forward but very slightly enlarges the thorax, which is compensated by the greater mobility of the diaphragm. The want of clavicles and the consequent falling in of the anterior extremities upon the chest, probably contributes somewhat to the straightness of the ribs.

The mediastinum is pretty broad. The pericardium is not here contiguous to the diaphragm, but there is an inch of space between them, in which the small lobe of the lung lodges; by this arrangement the liver, though perpetually pressing upon the diaphragm, cannot interfere with the motion of the heart.

The heart is situated with its point almost directly downward, according to the posture of the animal, and is but very little inclined to the left side. Its point is much sharper, and its shape more conoidal than with man; and the names of the right and left ventricles are proper enough, though not so with us, when they would with greater propriety be called anterior and posterior or superior and inferior. The vena cava is of considerable length inside of the thorax, having to pass nearly the whole length of the heart ere it reaches the sinus *laevis* or *dexter*. In man, so soon as it pierces the diaphragm, it enters the pericardium, which is firmly attached to it, consequently immediately enters the sinus, which, by the oblique direction of the heart is almost contiguous to the diaphragm. This situation of the canine heart evidently best agrees with the shape and position of the thorax, it being lower than the abdomen.

The egress of the blood vessels are also somewhat different, as the right subclavian of the dog is given off first; and as a large trunk is continued some way upward before the left carotid is formed, and divides into the carotid and subclavian of the right side, then the left subclavian is sent off—hence, properly speaking, there is no *aorta ascendens* any more than in man.

From this special distribution of the vessels of the right side, which happens though in not so great a degree in man, we may perhaps account in some measure for the greater strength, readiness, or facility of motion generally observable in the limbs of that side. Upon measuring the sides of the vessels, the surface of the united trunk of the right subclavian and carotid is less than that of the corresponding arteries of the left side, as they are separated; hence the resistance to the blood must be less in that common trunk than in the left subclavian and carotid.

But if the resistance be smaller, the absolute force with which the blood is sent from the heart being equal, there must of necessity be a greater quantity of blood sent through them in a given time; and as the strength of the muscles is, *ceteris paribus*, as the quantity of blood sent into them during a given time, those of the right side will be stronger than the left. Now, children early become conscious of this superior strength, and use the right arm on all occasions; thus from use comes the great difference which is so observable. That this is a sufficient cause seems evident from fact, for what a difference there is between the right and left arm of that modern Vulcan, the blacksmith? An examination will convince the most skeptical that the difference must arise from use. But if by any accident the right limb is kept from action for any time, the other, from being used, stimulates a greater flow of blood, and soon develops and gets to be the better. It is not to be imagined that the small difference in the original formation of the vessels should be sufficient to resist the effect of use and habit; instances to the contrary occur every day. It is enough for our argument that where no means are used to oppose it, the odds are sufficient to determine the choice in favor of the right. Observe a dog at a trot how he bears forward with his right side; or look at him when scraping a hole in which to deposit the bone he carries—you will perceive that he uses his right foot much more frequently than the left. Something analogous to this may be observed in the pawing of the horse. It was formerly the opinion of anatomists that left-handed people, as well as those distinguished by the name of *ambidexter* (who use both hands alike), have the two carotid and enclavian arteries coming off in four distinct trunks from the arch of the aorta; but examinations made for the purpose of determining this—though, indeed, but few—failed to confirm the hypothesis.

RAN.—Did you ever read Dr. John Brown's "Rab and His Friends?" If not, do so at once. It is published in handsome and convenient form by the Osmonds (price 50 cents), and also forms one of the Lakeside Library numbers (price 10 cents). It is one of the most exquisite sketches ever written, an admirable piece of artistic work, and as a portraiture of a noble dog simply unsurpassed. Here is the description of Rab, the hero:

I wish you could have seen him. There are no such dogs now. He belonged to a lost tribe. As I have said, he was brindled and gray, like Rubislaw granite; his hair short, hard and close, like a lion's; his body thick-set, like a bull—a sort of compressed Hercules of a dog. He must have been ninety pounds' weight, at least; he had a large blunt head; his muzzle black as night, his mouth blacker than any night, a tooth or two—being all he had—gleaming out of his jaws of darkness. His head was scarred with the records of old wounds, a sort of series of fields of battle all over it; one eye out; one ear cropped as close as was Archbishop Leighton's father's; the remaining eye had the power of two; and above it, and in constant communication with it, was a tattered rag of an ear, which was forever unfurling itself, like an old flag; and then that bud of a tail, about one inch long, if it could in any sense be said to be long, being as broad as long—the mobility, the instantaneousness of that bud were very funny and surprising, and its expressive twinklings and winkings, the intercommunications between the eye the ear and it were of the oddest and swiftest.

Rab had the dignity and simplicity of great size; and having fought his way along the road to absolute supremacy, he was as mighty in his own line as Julius Caesar of the Duke of Wellington, and had the gravity of all great fighters.

You must have often observed the likeness of certain men to certain animals, and of certain dogs to men. Now I never looked at Rab without thinking of the great Baptist preacher,

Andrew Fuller. The same large, heavy, menacing, combative, sombre, honest countenance, the same deep, inevitable eye, the same look—as of thunder as he p, but ready—neither a dog or a man to be trifled with.

A DOG CATCHER COMES TO GRIEF.—Martin Geisler, of One hundred and fifty-eighth street, was awakened at an early hour by the howling of his Newfoundland dog in the back yard. Throwing open the window a curious scene met his gaze. On top of the fence sat James Fay, assistant dog-catcher for the Twenty-third Ward, vainly endeavoring to hoist the dog by means of a rope and noose, which had been slipped around the animals hind legs. Mr. Geisler aimed a revolver at Fay and bade him depart, which he endeavored to do, but fell into the arms of a policeman, and was taken before Justice Wheeler and held to answer at the Special Sessions. Fay argued that he was discharging his duty.

It is to be hoped an example will be made of this scoundrel.

DESTRUCTION OF SHEEP BY DISEASE.—Nearly three million of sheep were destroyed by disease or the depredations of dogs and wolves during the last year, representing a money value of nearly \$8,000,000. The loss is greatest proportionately in North Carolina, Florida and Louisiana, and ranges from seventeen per cent. in the former State to three and seven-tenths in Nebraska, the average being about eight. The lowest rate is in the States having dog laws, and the highest is confined to the South, where almost every negro is the owner of one or more curs.

—This is a true story, for the Pittsburgh Gazette says it is:

At Hawkins Station, Pa., a day or two ago, a dog attempted to pass under a train, but was not quick enough, and the tip end of his tail was caught and cut off. He whirled around to see what was the matter with that extremity, and almost instantly his head was cut off.

—E. F. Mercellott's orange and white bitches, Pet and Grace, have recently whelped—Pet nine, five bitches and four dogs; Grace, eight, five dogs and three bitches; the former by Theo Morford's dog, Don, the latter by Morris's Pete. All orange and white with black points.

NAME CLAIMED.—I hereby acknowledge the receipt of a Moll II and Rufus II, pup from Mr. Von Culin, of Delaware City, Del., for which I claim the name of Bruce. He is entirely red, with not one white hair on him, and black nose and lips.

Geo. N. Bedwith.

The New York Kennel Club have three puppies for sale, two by "Rake" (half Laverack), out of "Flirt" (Irish). Information may be had from Dr. Strachan, 51 East Twenty-third street, N.Y.—[Ad.]

## Sea and River Fishing.

### FISH IN SEASON IN AUGUST.

| FRESH WATER.                                 | SALT WATER.  |
|--|--|
| Trout, <i>Salmo fontinalis</i> .             | Sea Bass, <i>Sciaenops ocellatus</i> .             |
| Salmon, <i>Salmo salar</i> .                 | Sheepshead, <i>Acanthopagrus probatocephalus</i> . |
| Salmon Trout, <i>Salmo confinis</i> .        | Striped Bass, <i>Morone tinnatus</i> .             |
| Land-locked Salmon, <i>Salmo gairdneri</i> . | White Perch, <i>Morone americana</i> .             |
| Grayling, <i>Thymallus tricolor</i> .        | Weakfish, <i>Cynoscion regalis</i> .               |
| Black Bass, <i>Micropterus salmoides</i> .   | Bluefish, <i>Pomatomus saltatrix</i> .             |
| M. nigricans.                                | Spanish Mackerel, <i>Scomber maculatus</i> .       |
| Masacapon, <i>Esox nubilior</i> .            | Cero, <i>Cybinus regalis</i> .                     |
| Pike or Pickerel, <i>Esox lucius</i> .       | Bonito, <i>Sarda pelamys</i> .                     |
| Yellow Perch, <i>Perca flavescens</i> .      | Kingfish, <i>Menticirrhus nebulosus</i> .          |

FISH IN MARKET.—Our quotations for the week are as follows:

Striped bass, 18 to 25 cents per pound; bluefish, 10 cents; salmon, green, 40 cents; frozen do, 30 cents; mackerel, 25 cents; weakfish, 12 cents; white perch, 15 cents; Spanish mackerel, 60 cents; green turtle, 12 cents; halibut, 18 cents; haddock, 8 cents; king-fish, 25 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 8 cents; porgies, 10 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 10 cents; soft clams, 30 to 60 cents per 100; Long Island trout, \$1; Canada do, 50 cents; hard shell crabs, \$4 per 100; soft crabs, \$1 50 per dozen; frog legs, 35 cents per pound.

VERMONT.—Lake Champlain is now resorted to by black bass fishermen, who report excellent catches.

RHODE ISLAND.—Perry Ralph caught seven hundredweight of bluefish near Point Judith, July 25, and six hundredweight July 26.

CONNECTICUT.—South Vernon.—Black bass fishing in the Connecticut now affords excellent sport.

Sunbury.—There was killed, recently, a night heron, eighteen inches high, with neat glossy plumage, and having three white cylindrical feathers, six inches long extending back from its head.

Mystic Island.—On the 4th ultimo friend Herbert and your humble servant packed traps for a few days sport, and took seats in the New Haven and Shore cars for Noank, Conn. A few days stay in camp induced us to strike tents and go over to Mystic Island, a beautiful cool and inviting spot, free from that pest, the mosquito, lying one mile out from shore. On the island we found a good hotel and good fishing. Our take was as follows, viz:

|   |  |
|---|--|
| July 9.....2 lines.....3 hours' fishing.....23 fish   |  |
| July 10.....4 lines.....8 hours' fishing.....122 fish |  |
| July 21.....1 line.....2 hours' fishing.....20 fish   |  |
| July 22.....2 lines.....6 hours' fishing.....52 fish  |  |

Tipping the scales at 10 lbs., 6 lbs., 4½ lbs., 4 lbs., down to 1½ lbs.

This island is situated on Fisher's Island Sound, and is about one hundred miles from this city, and the salubrity of the climate, the constant cool breezes, the shady walks, the ex-

cellent anchorage for yachts, and its accessibility to the main land should make it a favorite summer resort. WALTON.

MASSACHUSETTS.—Newburyport, July 30.—E. F. Hunt and J. M. Eaton captured a horse mackerel ten feet long, seven feet girth, and weighing about eight hundred pounds. He had several fins, varying from a foot to eighteen inches long, a large head which resembled that of a mackerel, and skin very hard and of a silvery color.

MOVEMENTS OF THE FISHING FLEET.—During the past week 84 fishing arrivals have been reported at this port, 10 from Bank trips, 47 from Georges, and 27 from mackereling voyages. Halibut have been in light receipt, 185,000 lbs. Bank and 24,000 lbs. Georges, and prices have ruled high. The receipts of codfish have been about 425,000 from Georges and 400,000 lbs. from the Banks. Mackerel have been in light receipt and there is no stock of consequence on the market.—Cape Ann Advertiser, Aug. 3.

NEW YORK.—The Adirondacks.—Warren P. Brady, Charles Trotter, John M. Propbet and Wm. Gage Brady have just returned from a two weeks' trip among the lakes in the southern part of the Adirondacks, and report the black bass fishing in these parts excellent. They caught great numbers in Lake Paradox, some weighing as much as 3½ pounds. The bass and pickerel fishing in Schroon Lake is also good. Trout in these parts is not as good as in former years, owing to the heavy rains.

NEW JERSEY.—Beach Haven.—Sheepshead fishermen complain of the wholesale destruction of these fish by the indiscriminate use of nets. Such numbers are taken that great quantities spoil before they can be disposed of. The hook and line fishermen have lost their vocation, and extermination of the fish is threatened.

PENNSYLVANIA.—Black bass fishing is unusually good this season at the Falls of the Schuylkill.

WISCONSIN.—Menasha, July 31.—Fishing has not been as good as usual this season thus far, on account of unusual low water and high winds. But our fall fishing is always the best. The low water, however, is the cause of an immense wild rice crop, larger than ever before, and that means ducks! ducks! ducks!

A DIPSEY.—The editor of the Buck's County (Pa.) Gazette informs an inquirer what a dipsey is, as follows:

Deep-sea Line (pron, dipsey), n. (Naut.) A line with a plummet at the end, called a deep sea lead, used for taking soundings at sea in deep water.—Zell's Encyclopedia.

When used in fishing a bow of whalebone or steel, having long snoods of horse hair or gut, to which are attached from four to six hooks, is fastened to the deep sea line about a foot above the deep sea lead. The lead rests lightly upon the bottom of the stream, the current carries the snoods at a right angle from the line, so that the baited hook is some distance from the line and bow. The jerk of the fish when biting at the hook is communicated by the elastic bow to the line, so that each nibble is distinctly felt by the fisherman in the boat above. This is called a bow-line. The deep sea line is often used without the bow, having the snood attached directly to the line, but the bite of the fish is not as plainly felt as with the bow. A gravel bottom is best for white catfish and perch, and a muddy bottom for yellow catfish and eels. The combination of the fish hook with the deep sea line was the invention of the river boatmen, who use the line and lead for their soundings in foggy weather, and who ascertained that by fastening a short line with a baited hook at a little distance above the lead, they could have excellent sport with bottom fish in deep water. The apparatus has of course been greatly improved since. The word "dipsey," or "dipsey," is merely a corruption of the original.

[The editor of the Gazette devotes two columns of his paper each week to shooting, fishing and the like, just as Brother Freas, of the Germantown Telegraph has done for many years. This department is well edited.—Ed.]

SHAD FISHING.—About a mile west of Point Judith Point there is a bend in the shore called Sand Hill Cove, and in this cove, feeding among the eel grass, I have seen more than 100 sharks at one time, ranging from the length of a man's arm to that of a good-sized row-boat. Thirty-five years since catching sharks was regarded rare sport, as well as profit, for during the days of tallow dips and whale oil as illuminators, the oil extracted from sharks' livers was looked upon by longshoremen as of no mean quality, since it burned in a lamp as well as the best right whale oil. One day in 1842, a friend by the name of Jacques and myself proposed to clear Sand Hill Cove of sharks, and to that end armed ourselves with a large hook linked to about four feet of chain, a seine warp for a line, part of a cedar fence-rail for a dobber, an old musket bygone secured to a rake-handle for a lance, strong grains (a double-pronged barbed spear), a good large row-boat, two bushels of bunkers, and a stone for an anchor. Anchoring on the ground we placed in a net-bag twenty or thirty mashed bunkers, and hung them over the bow to churn up and down with the motion of the boat; we also placed on the hook a couple of fish and threw out for a nibble. Soon the blood, scales, etc., from the bunkers began to raise a stir among the fish, and they came—large sharks, small sharks, fat sharks, lean sharks, and sharks by the hundreds; some sailing along slowly, almost touching the boat; others darting around with the speed of an arrow. Our hook proved too large for the small fry, they bothering us by picking off the bait; but we made sad havoc among the moderate-sized fellows with the grains. After catching a dozen or more of the smaller fry, an old 14-footer swallowed the hook, and to hold him was like trying to hold a steamboat. We, however, got a turn around the stern-post and checked him, when he walked off with the boat, anchor-stone and all. After a prolonged tussle we got him within reach of the lance, with which we soon settled his hash and towed him to the shore. During the day we took sixty-eight with grains and three with hook. The livers of this catch would yield more than one barrel of oil, and the variety was made up of blue, shovel-nose and mackerel sharks. It is almost needless to say that the seventy-one sharks captured did not diminish the numbers that frequented the cove. Sharks when taken in a boat are worse than byenas to bite, and have to be killed, which is conveniently done by severing the spine, or tapping them just above the root of the pectoral fin with a knife. They are regular ocean hawks, prowling about, pouncing upon, and eating multitudes of valuable fish, and a crusade against them would confer a blessing upon the human species. For twenty years I have lived by the sea and amused myself in catching sharks and other fish, and notwithstanding the former are numerous, and people are constantly exposed, I never knew one to attack man, and never saw a person that had witnessed such an occurrence.

STRAIGHT-BORE.

## National Pastimes.

**CHES.**—There seems to be a revival of interest in the game of chess. Thursday, July 19, a meeting of chess editors, players and problemists was held at the "Cafe International," 609 Broadway, and the "American Chess and Problem Association" was formed with the following officers: E. B. Cook, Hoboken, N. J., President; J. G. Belden, Hartford, Conn., first Vice-President; J. G. White, Cleveland, Ohio, second Vice-President; J. B. McKim, Cleveland, Ohio, Secretary; Dr. C. C. Moore, New York City, Treasurer. Executive Committee—Philadelphia, Emerson Bennett; New York City, Henry C. Allen; Chicago, Dr. Spencer; Boston, Ben. Ware; Detroit, D. C. Rogers. R. H. S.

**PROBATION.**—A walking match between the two well-known English pedestrians, W. Howe and W. Perkins, came off at Littlebridge, London, England, July 16th. The race was won by Perkins, who walked 22 miles, 100 yds., in 2h. 58m. 52s. This is a wonderful performance, and surpasses any three hours' walk heretofore attempted.

—At New London, Conn., August 1, Miss Bertie Le Franc walked forty-two miles in 9h. 15m. 2s., making her last mile in 9m. 54s.

—The jumping match for \$1,000 and the championship of America, which took place at San Francisco, July 29, was won by J. R. Slode, of Omaha, and Richard A. Hill, was won by Hill.

**CLAN-NA-GAEL SPORTS.**—*Brooklyn, Aug. 2.*—Summary: Three standing jumps.—D. McMahon, 35 ft 6½ in.; T. Lynch, 35 ft 5 in.; Hop, Step and Jump.—James Daley, 38 ft 6½ in.; D. McMahon, 38 ft 5 in.; Heavy Weight Contest.—J. Daley, 21 ft; T. Lynch, 21 ft; D. Londergo, 20 ft 11 in.; Throwing the Light Stone.—J. Daley, 47 ft 11 in.; W. Persel, 46 ft 9½ in.; Sack Race.—Won by F. Marshall, who did 250 yds in 1 m 17¾ s. Back Mile Walk.—S. Marshall, 4m 2¼ s; M. Sinitot, second. Mile Run.—N. Carrey, 4m 50s; M. J. Gilligan, second. Hurdle Race.—A. C. Reid, 2m 30¾ s; F. Marshall, second.

**NEW YORK ATHLETIC CLUB.**—The second annual championship games (open to all amateurs) of this club are to be held at Mott Haven, Sept. 8th. Intending competitors can secure necessary information by addressing A. H. Curtis, Sec., P. O. Box 3101, New York.

**ADDELPHI AND ATHLETIC CLUBS, Capitoline Grounds, Brooklyn, July 30.**—Summary:

One Hundred Yard Dash.—Wm. Holden first, David West second, and Jared Hillyer third; won by 7 yards, 2 yards separating second and third. Time, 1½ seconds. Putting the Shot.—C. Weigand, 25 ft 2 in.; Jared Hillyer, 24 ft 10 in.; G. F. Gray, 23 ft 10 in.; Snauling Long Jump.—J. Hillyer, 8 ft 9 in.; C. Weigand and S. S. Ho per both cleared 8 ft 8 in.; in deciding jump latter defeated. Two Mile Walk (amateur open).—E. C. Holke, Harlem Athletic Club, first; Bures, of the same club, second; W. Van Riper, of the same club, third. Time, 17m 17s. Pole Vaulting.—Hooper, 7 ft 3 in.; Hillyer, 7 ft; West, 6 ft 8 in. Standing High Jump.—Hooper, 4 ft 1 in.; Hillyer, 4 ft 1 in.; Hooper won second trial; Weigand, with 4 ft, was third. Two Hundred Yard Dash.—Jared Hillyer won in 35s; D. West second, J. Hillyer third. One Mile Run.—W. J. Duffy, of the Harlem A. C., won in 4m 58¾ s; Richard Morgan, Harlem A. C., second. Running High Jump.—D. West, 4 ft 6 in.; H. Faulkner, 4 ft 6 in.; Paul Smith, 4 ft 6 in.; Hop, Step and Jump.—W. Holden, 34 ft 3 in.; Hillyer and Hooper tied on 34 ft; won by Hooper. Throwing the Hammer.—E. Fyatt, 48 ft 5 in.; Hillyer and West both cleared 46 ft; deciding throw in favor of West. One Mile Walk for Club Members.—Holden won in 8m 38s; Thompson second, Ransom third. One Hundred and Twenty Yard Hurdle Race.—Jared Hillyer won in 22¾ s; David West second.

**MERION, OF PHILADELPHIA, vs. MANHATTAN, Brooklyn, Aug. 3.**—Summary:

## Answers to Correspondents.

## No Notice Taken of Anonymous Communications.

C. A. W., Fairland, Ind.—The Remington gun is a good gun for its price.

J. M. C., Canandaigua, N. Y.—Can you send me Fowler's "Birds of Central New York" in any other form than in the FOREST AND STREAM? Ans. We cannot.

S. W. J., North La. Crosse, Wis.—Is there anything I can put on my tent to make it fireproof? Ans. Yes, but it will cost as much as to buy a tent already fireproof and will be likely to spoil the tent you have. Best buy a new tent.

H. G. C., New York.—Will you please be so kind as to inform me where, in this city, I can obtain a pair of cotton stockings suitable to wear with knee-breeches for shooting purposes? Ans. Thomson & Son, 301 Broadway.

T. W. E., Houghton, Mich.—Please inform me in regard to the target on the front page of your paper? Ans. The target is placed there as an ornament to hide a hole at its back. It is not to shoot at.

H. M., Frankford Arsenal.—Please give me a good recipe for the wicked flea? My family of pups is pestered thereby. Ans. Persian insect powder is said to be good. Powdered leaves of the flowering pyrethrum (*Pyrethrum roseum*).

Cresson, New York.—Will you inform me whether I will find any shooting at Cresson Springs, Pa.? Is that a good locality for squirrel shooting? Ans. We are so informed, but squirrels are somewhat migratory in their habits, and cannot be depended upon to inhabit any one place for two years consecutively.

LACHINE, Montreal.—Under the rules of first-class American or British rowing clubs are pin oars (that is, oars with a hole through them working on a pin in the gunwale of the boat) allowed to be used at their regattas or not? Ans. We believe not.

H. S., Boston.—Can you give me the name of a book giving names and description of the different insects? Ans. "Our Common Insects," by A. S. Packard, Jr., published by Estes & Lauriat, Washington street, Boston, Mass., will give you all desired information.

B. L. C., Central City, Iowa.—I wish to obtain the rules for governing rifle clubs, if such rules are printed. Where can they be obtained? Ans. Remington's catalogue has them, or you will find them in the "Forest and Stream Hand-Book for Riflemen." Published by J. B. Ford & Co.

J. H. B., Cincinnati, Ohio.—Where can I find good fly trout fishing in West Virginia? Ans. The Blackwater region of West Virginia; reached via wagon road, twenty-eight miles from Oakland, Md., on the Baltimore & Ohio Railroad, affords excellent trout fishing in September. Write to Wm. Kitzmiller, Oakland, Md., or Thomas Basley, of the same place.

W. N., Gorham, N. H.—I have three young wild black duck about one-half grown, which I wish to raise for decoys. What is good feed for them, and what kind of shelter is best for them through our winter months? Ans. House and feed them same as tame ducks, giving a little raw hashed meat occasionally. Send to Wm. Lyman for his catalogue of rowing gear.

OHIO, Cincinnati.—Is there such a thing as shooting deer with a shot gun? Please tell me the bore, length, etc., that would be best adapted for miscellaneous shooting? Ans. Yes, it is very common; may prefer the shot gun to the rifle for this purpose. For general shooting we prefer a 12-gauge, 8-lb. gun, with 30 or 32-inch barrels.

C. E., New York.—Is there a good pocket guide to Nova Scotia published? Also, will there be any good hunting on the north coast or in the Bay of Fundy this month? Ans. Map at A. W. Makinlay's, Halifax, N. S. Moose hunting is permitted Sept. 30, but a license of \$20 is first demanded.

SUBSCRIBER, Brooklyn.—I have a small terrier dog, and in cutting his ears part of the lobe of one ear was cut, and it has never healed. Can you inform me of any preparation which will heal it? Ans. Wash wound clean with castile soap and tepid water. Then bring the edges together, and cover them on both sides with a strip of cloth on which simple cerate has been spread, then fasten them down with collodion and leave until well.

M. R. H., Shelbina, Mo.—1. Would you advise me to buy a breech-loader with a pistol shot or not, and what is its advantage? 2. Do you think that English chilled shot will give better results on quail and grouse than soft shot? Ans. Yes, it is much easier to manipulate. 2. There is a diversity of opinion regarding chilled shot. Our best shots say that it is superior to soft shot only when shooting from the trap with a gun that is heavily choked. The trap you speak of is not in the market. The Bogardus trap is best known; price \$8.

W. H. T., Kendallville, Ind.—Can you inform me of the nature of the small grub found in black bass? I examined one to-day and it was almost identical with our common bloodsucker, except in size and color. Are bass fit for food when these grubs are to be found in them? Ans. Almost every fish has its own peculiar parasite. As to being fit for food, it is a matter of opinion; they are eaten at such times by some, and so are the inhabitants of the capillary substance which adorns the occipito frontals of the Diggers by the proprietors of these pastures.

F. W. B., New York.—How can I cure fish so that they will keep until winter? Ans. Take your fish and split it open; wipe it clean, but don't wash it; lay in a keg, skin down; sprinkle on each layer of fish a mixture composed of one-half salt and one-half Muscovado sugar, putting on about one-half the quantity usually used in salting fish. On arrival home, re-pack, using a very small quantity of the same mixture. Rinse in fresh water before cooking.—*Hallock's Sportsman's Gazetteer*, page 557.

FRANK HASKELL, Sacarappa, Me.—I notice that in two instances in your ANSWERS TO CORRESPONDENTS, you have informed the inquirers that they could shoot woodcock in certain places in this State during the months of July and August. I would suggest that it would be well to inform such inquirers that there is a game law in this State, and that there are also sportsmen here who will enforce it. You have published an abstract of the game law of Maine in FOREST AND STREAM and its provisions should be made known to the inquirers mentioned above. Ans. We do not discover the instances to which you refer, but we do find in our last issue the information given to a correspondent that woodcock cannot be shot in Maine before Sept. 1, according to law. We have a standing list of game in season at the head of our Game Bag and Gun column, which our readers seem to wholly ignore.

C. R., Passaic, N. J.—What shall I do to effect a cure of the eyes of my setter puppy? In the inner corner of each eye is a lump of hard, fleshy matter, protruding about one-quarter of an inch, and about the size of the end of a man's little finger. It is now only about half the size of what it was at first. Ans. The lumps can be removed by the use of glacial acetic, or by chromic acids, but they demand great care

in using. The former is preferable, and the contiguous parts must be first touched with sweet oil. Better yet, consult a surgeon, and let him remove with scissors.

CHAMBERLAIN, New York.—Will you please inform me what the regulation length of the 10-pound hammer handle is? and also please give the three best throws of the 12-pound hammer? Ans. We are unable to give the regulation length of hammer; we believe this is usually decided by each association for itself. The best throws of the 12-pound hammer are not on record. That of 16 pounds was 122 feet 6 inches, by E. S. Brown, April 6, 1878, at London, England.

BACK-ACTION, Noroton, Ct.—You say in your Answers to Correspondents to use as much powder in a shot gun as the shoulder will bear. I use 4 drachms of Lightning powder in a Remington 12-bore, 8½-lb. breech-loader, but could bear a drachm or so more, if I could get it in my she is. I use one ounce of shot and two wads over the powder. Could I use 4½ drachms or 4¾ drachms powder and ¾ ounce shot with good effect? Ans. Hardly; you had best be satisfied with the charges you are using.

SUBSCRIBER, Duxbury.—Will you kindly inform me what you consider the best food, also of vegetables, for setters in warm weather, and how to prepare the same? Ans. Spratt's biscuits are excellent. Barley and oatmeal, the dross of wheat flour, or any mixture of these same with broth or skimmed milk, is very proper food, varying it twice or thrice a week with graves from which the tallow has been pressed, mixed with flour; or sheep's feet and heads, well baked or boiled, forms a good diet.—*Hallock's Sportsman's Gazetteer*.

G. H. R., Gainesville, Texas.—I saw a hawk to-day the size of *B. lincaus*, and somewhat the shape, sailing overhead (and it poised for some seconds within gun shot), which was pure white underneath, excepting a dark brown pectoral crescent and the tips of primaries and secondaries, which were black. As well as I could see, the upper parts were brownish or bluish. I have seen perhaps a dozen of these birds this season, but never so closely before. Can you tell what it is? I have never seen *Blanius leucurus* here, and thought of it, but the tail was not white above, and I thought it too heavy for a kite. Ans. We should not dare to conjecture what it may have been. The description is too meagre.

INQUIRER, Dorchester, N. Y.—1. Do you consider the seven-shot revolver, advertised by Western Gun Works for \$3, a good, safe and reliable weapon? 2. Which of the following three guns would you prefer for general use, everything considered? (1) a \$45 Remington, (2) a \$50 Parker, (3) a \$50 Fox? You may designate above by numbers if you prefer, so as not to discriminate between manufacturers openly. 3. Do you consider the rifle advertised by Turner & Ross, in your issue of July 5, equal to a \$20 rifle? Ans. 1. Probably as good as any for the money, but we don't want any. 2. We do not discriminate between manufacturers; all have their respective merits. 3. We know nothing of it.

R., Goshen, N. Y.—Can you tell me what to give my black and tan dog to enable him to retain his food? He eats heartily, but for over two months has thrown up everything he takes into his stomach. In seven years old, seems bright and lively, but has been devoured by fleas; have tried carbolic soap without much success. I have used sulphur in the water given him to drink, as has been suggested, but nothing seems to help him, and as he is a great pet we are anxious to relieve him. Ans. Give him 5 grains of the following powder three times a day: Powdered rhubarb, 6 drs.; powdered white castile soap, 2 drs.; powder. cubens and septandrin, of each 1 dr. Mix in mortar, and pass through a fine sieve. To rid him of fleas, use a powder of *pyrethrum roseum* (dowering pyrethrum).

R. R. D., Rochester, N. Y.—Can you inform me where, either in Canada or Northern Michigan, I can find good shooting and fishing in the month of October, also routes of reaching same? Ans. Go to the Clear Falls. Take railroad to Buffalo, then Grand Trunk Railroad to Port Huron, Mich.; thence by Star line of steamers to the Star Island House at the Flats. Good fishing for bass, pickerel (wall-eyed pike), etc. Plenty of wild fowl. If deer shooting is desired, write to Robert Graham, Peck Post Office, Sanilac County, Mich., and inquire for terms, etc., which, if satisfactory, you can arrange to have him meet you at Lexington. Lexington may be reached from Port Huron by Star line of boats, being 25 miles away. Graham knows every inch of the peninsula between Lake Huron and Saginaw Bay, and is every way reliable.

F. J. L., Williams' Rancho, Texas.—I determined last fall to go into the sheep business, and had some Leicester and Scotch black-face sheep sent over from England. The sheep have all done well except that they have had what we call "Snuffles" (I don't know what you call it here). It is a severe running at the nose. I have tried pine tar on their noses, and given them wood ashes in the salt, but neither has had any beneficial effect. Although this is foreign to sporting, could you please tell me of anything to cure them of their ailment? Ans. No remedy has been found that is considered at all reliable. The inhalation of the vapor of turpentine often proves beneficial, or as-fetida dissolved in milk may relieve. It is said, also, that a second attack is inevitably fatal.

W. A. C., Andover.—I have a large English pointer dog two years old. One of my kind neighbors had the cruelty to lodge a bullet from a large navy revolver in him just back of his armpit, on the left side. That was three months ago, since which time he is apparently all well; but as soon as I work him, and he gets a little excited, he will tumble over, acting perfectly blind, will run into trees head first, and finally end in falling down in a spasm, frothing copiously at the mouth. When he recovers he will stand off and bark at me, but still he will obey my commands. If water is near he will plunge into it, but it leaves him very weak. Is there any cure, or shall I kill one of the best trained of dogs? Ans. No, we should not kill him, but trust time and nature to repair the injury done to his nervous system.

J. T. B., Stamford, Ky.—I was out salmon and bass fishing in strange waters to me last week, and had my fishing suggested by the promptness with which a large fly was gobbled every time I saw one fall upon the water and vainly struggle to rise. It is superfluous to tell you I know nothing of entomology, as my description will proclaim. A large, lead-colored fly, similar to dragon; long, slender body, large wings, (I thought two pairs to each insect). Natives couldn't tell me a name. I had never before seen one. They say the fly has "plinchers" at head and rather long "feelers." It is evidently a very killing fly, and if you can conjecture what it is, please advise me what fly to call for. I propose returning to the Clear or Middle Fork of Rock Castle this fall, and intend to try fly-fishing. Haven't been able to procure the "Gazetteer" through our book dealers yet. Feel assured I shall find desired information in it. Ans. The fly was no doubt one of the *Libellulidae*, but of what species, or even genera, it is impossible to say.

—Undoubtedly one of the best and cheapest stocks of Carpets, Oilcloths, Mattings, etc., to be found in the United States is that of Messrs. JOHN H. PRAY, Sons & Co., Washington street, Boston. I. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him or with any orders sent him. It is a good, reliable house.—[Ad.]

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR RECREATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.  
(Post Office Box 2832.)

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, AUGUST 9, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURRILL, Chicago, Western Manager.

## CALENDAR OF EVENTS FOR THE COMING WEEK.

Thursday, Aug. 9.—Trotting: Hudson, N. Y.; Prophetstown, Ill.; Tiskilwa, Ill.; Sullivan, Ill. Base ball: Cincinnati vs Chicago, at Chicago; Louisville vs St. Louis, at St. Louis; Manchester vs Maple Leaf, at Guelph, Canada; Buckeye vs Allegheny, at Allegheny; Resolute vs Stove, at Meriden, Conn.; Louisville vs Milwaukee, at Milwaukee; Rochester vs Wilkesbarre, at Wilkesbarre, Pa. Creedmoor: Infantry, 6th Brig., 2d Div. Scull race between Hosmer and Driscoll.

Friday, Aug. 10.—Trotting: Prophetstown, etc., as above. Base ball: Hartford vs Boston, at Boston; Louisville vs Milwaukee, as above; Rochester vs Wilkesbarre, as above; Resolute vs Waterbury, at Waterbury, Conn.; Monticello vs Osceola, at Jersey City; Enterprise vs Volunteer, at Poughkeepsie. Creedmoor: Infantry, 11th Brig., 2d Div.

Saturday, Aug. 11.—Running meeting; at Saratoga. Base ball: Hartford vs Boston, at Boston; Cincinnati vs St. Louis, at St. Louis; Louisville vs Chicago, at Chicago; Resolute vs Independent, at Norwalk, Conn.; Star vs Quickstep, at Greenville; Magnolia vs Continental, at Prospect Park; Arlington vs Alaska, at West Brighton; Enterprise vs Active, at Wappinger's Falls. Creedmoor: Practice. Scottish-American Athletic Club games, Virginia City Caledonian Club games. Glass ball shoot at New York.

Monday, Aug. 13.—Running meeting, as above. Base ball: Cincinnati vs St. Louis, at St. Louis; Louisville vs Chicago, at Chicago. Creedmoor: Cavalry, 1st Div.

Tuesday, Aug. 14.—Trotting: Lowell, Mass., Warwick, N. Y.; Pittsfield, Mass.; Gardiner, Me.; Mendota, Ill. Running meeting, at Saratoga. Creedmoor: Practice of American Team. Rowing: Dole vs Brown, at Providence. Regatta of South Boston Yacht Club.

Wednesday, Aug. 15.—Trotting, as above. Running meeting, as above. Creedmoor: Third competition for Ballard mid-range rifle, N. R. A.; at 2.30 P. M., Stock Exchange Rifle Club competition for the bronze National Association medal. Regattas: National Association of American Oarsmen, at Detroit, Mich.; Championship Race of Quincy Yacht Club, off Mead's Hotel, Quincy Point, Mass.

Thursday, Aug. 16.—Trotting, as above. Running meeting, as above. Creedmoor: Infantry, 11th Brig., 2d Div. Regatta, at Detroit as above Albany Caledonian Club games. Glass ball Championship tournament, at Brooklyn Driving Park.

—With this issue begins the fifth year and ninth volume of the FOREST AND STREAM. The object of this paper has ever been to promote a healthful interest in outdoor recreation, and cultivate a refined taste for natural objects. At no time has the paper been so strong as at present. In its enlarged form, and with the careful attention paid to subjects which come within its scope, it is emphatically the journal of the American Sportsman and naturalist.

ARCTIC EXPLORATION.—Capt. Howgate's Arctic expedition left New London Aug. 4th for the Polar seas.

## GAME PROTECTION.

THE MASSACHUSETTS GAME LAW.—In our issue of July 26 we published a letter from Mr. John P. Ordway, respecting the defects of the law as it now stands, and the response from Mr. W. Minot, Jr., as appeared in the Boston Globe. Dr. Ordway replies as follows:

To the Editor of The Globe:

Sir—My attention has just been called to a letter from Wm. Minot, Esq., published in your paper of the 23d inst., assuming that the present game law is, although very defective, sufficient to convict, from the fact that the birds being in possession out of season is *prima facie* evidence, and throws the whole burden of proof on the offender. But does Mr. M. assume that *prima facie* evidence is positive evidence? And does he not know that in almost every case of possession the birds have been expressed from one place to another, so that the buyer is warranted in saying they came from Rhode Island, or Connecticut, or some other place, and could not swear they were killed in Massachusetts? There are so many ways of evading the law in its present shape, that, as I stated in my former letter, it is, in my opinion, virtually good for nothing. The eighth section of the game laws undoubtedly gives power to obtain a warrant from any judge by the complaint stating that persons have woodcock or quail in possession, but the misfortune is that the first section states where the birds must have been killed in order to convict. I consider Mr. Minot an excellent lawyer, and should be pleased to have him try a few cases, but am afraid he would spend his time and talents in trying to convict without avail. He can probably find the birds on sale in almost any provision store where game is kept, and if he thinks the eighth section a saving clause, I trust he will put the matter to a test. Charles Hallock, Esq., editor of the FOREST AND STREAM, in his latest issue, says: "The Massachusetts law is certainly defective, and should be altered, if intended at all to accomplish its purpose." As one of the executive officers of the Massachusetts Fish and Game Protective Association, acting upon the opinion of several legal friends, I should not personally feel willing to risk the reputation of our society by obtaining warrants under the present law.

JOHN P. ORDWAY,

Pres. M. F. and G. P. Association.

[Mr. Ordway is undoubtedly right in this matter, and as before intimated, we consider it a disgrace that the Commonwealth of Massachusetts passes a law that allows her residents to cross her borders and violate the enactments of other States with impunity. He who crosses the line into contiguous States and kills woodcock out of season is safe when he returns, to Massachusetts, by simply proving that the game was not killed within her boundaries, consequently the law as it now stands encourages crime.—Ed.]

—An epidemic of some kind is prevalent among the deer on South Mountain, Pa. Several have been found dead and others found with bodies drawn up, cramped and almost bent double.

WHO KILLED THE BIRD.—The following solution is offered for this too often difficult problem:

Request the disputants to assume, as near as possible, the positions they held while firing, and then place the bird with wings extended at about the distance it was from them when flushed. This forms a triangle, and by examining the bird examine the point where the shot entered, and the bird belongs to the man on the side of the bird where the shot entered. This method is very simple, and by its use I have many times performed the "role" of peacemaker. WING SHOT.

San Diego, Cal.

KILLING BIRDS OUT OF SEASON.—Under this caption the Marshall (Tex.) Tri-Weekly Herald of July 26 publishes the following:

Waxahachie, Texas, June 28.—Young prairie chickens are in season, and fishing splendid. If any of the New York boys will come out next fall I will show them how to kill buffalo.—FOREST AND STREAM.

We are at a loss to understand how a paper professing to be a sportsman's journal can be induced to publish such a contribution as the above. The Forest and Stream may possibly fall into the hands of some would-be sportsman, so, like as not, would take for Gospel what the Waxahachie pot-hunter (endorsed by one of the leading sportsman's journal of the country) says, and the death of a few half-fledged grouse would probably be the result. We unfortunately have no game law in Texas, or our Waxahachie friend would in all probability be languishing in the calaboose—but it is, we think, hardly necessary to assure sportsmen of any section of the country that chickens (grouse) are not in season in June in Texas (or any other State), and even if they were, that the heat on the prairies is so intense, and water so scarce, that it is almost impossible to get any shooting worthy of the name before September at the very earliest. Such paragraphs as the above are, unfortunately, far too common in our sporting papers; and if, instead of gratifying the ambition of this class of contributors by allowing them to see their trashy effusions in print, the editors of these papers would give them the snubbing they so richly deserve, they would receive the thanks of sportsmen generally, and to a certain extent, be doing their duty.

[We take great pleasure in promulgating the Herald's ideas, and since our Texas friends feel worried over their shortcomings and our own, we trust that they will take measures that will induce the Legislature of the Lone Star State to enact suitable laws towards the protection of game. We necessarily print many items that we do not indorse, and we supposed that the readers of the FOREST AND STREAM had by this time obtained a pretty fair sample of our opinions regarding the protection of game. If we stopped to score all the notes like the one quoted by the Herald it would keep us pretty busy, for although we do not publish a tri-weekly paper we find the week sufficiently short for our purpose.—Ed.]

NOVA SCOTIA, *Italy*.—After September 1st 1877, the game laws as applied to Moose and Caribou are as follows:

1. After this Act shall come into operation, no person shall kill, or pursue with intent to kill, any moose or caribou, save only during the months of October, November, December and January, in any year, or shall expose for sale, or have in his possession, any green moose or caribou skin, or fresh moose or caribou meat, or any part of the carcass

of a moose or caribou, killed in this Province, except in the months aforesaid and the first five days of February in any year. The possession of any green moose or caribou skin, or meat, or any part of the carcass of a moose or caribou, during the close season shall be presumptive evidence of such moose or caribou having been illegally killed or taken.

2. No one person, or number of persons forming a hunting party, shall, during any one year or season, kill or take more than three moose and five caribou.

3. Any person or party of huntersmen who may kill a moose or caribou shall carry the flesh thereof out of the woods within ten days after killing the animal, except as regards moose or caribou killed in the latter part of January, which must be carried out within the first five days of February.

4. No person shall set any snare or trap or pits, for the destruction of moose or caribou, under a penalty of one hundred dollars for each offense; and any person finding such snare or trap may destroy the same. The possession of any such snare or trap shall be presumptive evidence of the person in whose possession it is found, to set the snare for the destruction of moose or caribou.

Section 37 will be of particular interest to the citizens of the United States who are wont to hunt in this province. It reads as follows:

No person not having his domicile in the Province of Nova Scotia shall be entitled to the privileges granted by the game laws in force in such Province for the time being, without having first obtained a license from the office of the Provincial Secretary. Every such license shall be signed by the Chief Game Commissioner and countersigned by the Provincial Secretary or his Deputy, and shall be in force for one year from the first day of September in each year, and shall be subject to the enactments of the game laws in force in the Province at the time said license is granted. The fee to be paid therefor into the Provincial Secretary's office shall be twenty dollars, and the fund derived from this source shall be applied toward the expenses incurred in carrying out the provisions of the game laws.

Any person violating this section shall be liable to a penalty of not less than twenty dollars or more than fifty dollars for each offense, in addition to the license fee, and costs of prosecution to be recovered in the manner prescribed by section eleven, and, when recovered, to be paid one-half to the prosecutor and the other half into the Provincial Secretary's office, to be applied as heretofore provided. Officers in Her Majesty's service, officers of the Army and Navy on service in this garrison, shall be entitled to the privileges of the game laws of the Province on the payment of an annual fee of five dollars into the Provincial Secretary's office, for which they shall obtain a license for the period of twelve months. Holders of licenses granted under the provisions of this Act must produce the same when required so to do by any Justice of the Peace, Game Commissioner or Warden, or officer of the Game and Inland Fishery Protection Society.

—Of two poachers recently discovered on the game preserves of Baron Rothschild, at Orsy, France, one was immediately shot dead by a keeper, and the other, having slightly wounded one of his captors, was sentenced to twenty years in the galleys. And all for a hare!

DEATH OF ROYAL.—We regret to announce the death of Captain James Esdaile, of Montreal, at the early age of thirty-two years and six months. Mr. Esdaile was a thorough sportsman, in the true acceptance of the term, having an excellent knowledge of the habits of wild animals, birds and fish, as well as the mode of capturing them. He was a valued contributor of this journal, and ever foremost in the rank of game protection. A warm friend and genial companion, his death causes a void that cannot again be filled.

## GAME BIRDS OF NEW ENGLAND.

EUROPEAN QUAIL.

FOR several years gentlemen in this vicinity, who are interested in the preservation and propagation of game, have been discussing the practicability of introducing some new species of game birds into New England. When we consider how few we have of really game birds—birds that will lie to and are hunted with dogs—and these few growing fewer and fewer every year, the reason for this solicitude will be obvious. If we name partridges (*Bonasa umbellus*), quail (*Ortyx virginianus*), woodcock (*Philohela minor*) Wilson snipe (*Gullinago wilsoni*), we have enumerated about all that are worthy the attention or consideration of sportsmen. There are a few other species, some of which will lie to a dog, that are occasionally admitted to bag; but to a true sportsman, who enjoys the manly and invigorating exercise of the field, they offer very little satisfaction. Among the indifferent birds, the spruce partridge (*Canace canadensis*) which inhabits the northern part of New England, is of good size, and will sometimes lie to a dog, but are not numerous. Their home is a great way off from sporting centres, in a region where there are very few other game birds; are difficult to shoot, shying about in dense spruce or hemlock forests, and, gastronomically, are of no account, nor are they often on sale in our markets.

We have at times several species of the rail family, but they arrive late and depart early, are here during the hottest weather, are found only in reedy bogs or filthy sloughs where no sportsman likes to go; and although most game dogs will point them, they have no dignity of character, and while the dog honestly thinks he has game, the little Railus is running, swimming, diving, flying—anything to sneak away and puzzle his pursuers until he is far over the bog or thick reeds, beyond reach, or, if reached, is a poor reward to dog and man, and in this latitude is almost never hunted "per se." Further south they are more abundant, and one may fill a bag or boat as he pleases.

Along some of the hill-tops or valleys of New England one occasionally meets with a very delicious bird, the upland plover (*Actitis bartramia*), but they will not lie to a dog or anything else, are very wary, will respond to no call note or decoy, and are hardly to be considered game birds in the sense we have indicated.

There are a few other birds that are sometimes shot, among them the meadow lark (*Sturnella magna*), which most any bird dog will point; but the bird will lie as well to a man or cow as to a canine; nor are they regarded as very gamey.

Snipe shooting is, we believe, everywhere regarded as very fine sport, than which, in some sections of the United States, none is better. In New England—more particularly in the northern and eastern parts—none is, however, more uncertain

or perplexing. They are here to-day and there to-morrow, never staying long in a place, and some seasons scarcely making an appearance at all, though, when found, lie tolerably well to a dog, and are a nice, palatable bird. We have been unable to suggest any of the *Sceloporidae* as a substitute or auxiliary. There are many species of the snake in the world, but their habits are so nomadic as to render hopeless the task of localization or breeding.

The woodcock is, to our mind, the crown jewel, the very *ne plus ultra* of all sport. To a man who loves a well-bred, well-trained dog, and also loves shooting in cover—with as dear old Isaac Walton used to say—"a companion that is cheerful and free from swearing," no bird gives so much pleasure, so much real joy and satisfaction as this noble bird—the woodcock. They arrive in March, breed early, stay with us till November, and would probably be quite plenty if we could enforce a law making all the year, except September, October and November, a close season. But these birds are mercilessly pursued by old and young, in season and out of season, with all sorts and conditions of arms and animals, until it is almost impossible to make a respectable bag. It is believed that some of our finest woodcock sections have been ruined by the birds being killed in June on their breeding grounds, and none are left the following spring, as they are wont, to return to the place of their nativity to reproduce their young. Stringent laws have been granted by the Legislature, but there seems to be no disposition on the part of the gunners to observe, or the authorities to enforce these laws. Game laws are looked upon by most people as an infringement of their natural and inherent rights, to be spurned and trampled upon whenever and wherever encountered. The earlier settlers of New England had to contend with the savages and savage beasts for the soil they occupied, and only by the skillful use of the gun were they frequently saved from destruction. When starvation stood upon the threshold of the little hut, the gun brought the wished-for meat, and all were happy again. Hunting was a necessity, and what at first was a pinching necessity afterward became a pleasant pastime. As game grew scarce, the aid of the Legislature was invoked for its preservation, but many shortsighted persons declared that gunning and fishing had in this country ever been free, and so they must forever remain. And this is the spirit by which the friends of the protective system are met. Time, observation, statistics, our sporting literature and intelligent sportsmen are doing much to obliterate these prejudices, and yet he who undertakes to correct or reform the habits or morals of a people, has before him no light task. But the question before us now is, can we introduce any new species of waders that will take the place of or aid in preserving our woodcock? Would the European woodcock (*Scopus rusticola*) if once planted here, be successful in its results? It is a splendid bird, larger than its congener this side the ocean, and if colonized would probably thrive well. It is, however, no easy matter to capture them in such numbers as would be required to stock a continent. It would be a grand enterprise, and we hope some magnanimous individual or rich club will do itself the honor of the experiment.

The partridge is the largest of our game birds, and is eagerly sought, both for table and field. They are hardy, capable of enduring the severest weather, feeding in winter mostly on buds and roosting upon trees, or plunging into soft snow to escape the cold and other enemies. If while thus encased in flaky folds, a light rain should fall and then suddenly freeze so as to form a crust, they would be unable to extricate themselves, and quite likely in this way many would perish. But the most destructive enemy of the partridge is the snare or trap. An expert with these wicked and nefarious contrivances can, in a short time, "clean out" all the partridges within his reach. No species of bird can, we presume, be exterminated by the gun, while several may be with snares.

Then we have the sharp-tailed grouse (*Pediceptes phasianellus*) of the Rocky Mountains, which would undoubtedly thrive well in the mountain regions of New England. They survive the winters there, why not here? We know that climate, soil and food have much to do with the successful planting and propagating new species of plants or animals. Many years ago some benevolent gentlemen undertook to colonize the pinnated grouse, or heath hen (*Cuspidonia cupido*), on Cape Cod. Ample legal protection was thrown around them by the Legislature, and it was believed they would in time spread and populate the whole commonwealth. But in place of doing this, they gradually dwindle away, most likely from want of food in that barren region, till none are left, save possibly a few on the island of Naushton. This may be another evidence in favor of Darwin's theory of the "Survival of the Fittest." *Phasianellus* may be one of these, while *Cupido* evidently is not. We hope, before another spring, some liberal minded individual will not only stock the Green Mountain range with these noble birds, but also the heaths of Cape Cod.

In Europe, there are several of the partridge family that would undoubtedly thrive well in this country, among them the English partridge (*Perdix cinerea*) is very prolific, feeding in corn and turnip fields, where they persist in staying, and if driven from one part, they immediately rally in another; but as they roost upon the ground huddled together, and are not migratory, it is somewhat problematical whether they would go through our hard winters. The latitude of Virginia would suit them splendidly, and would, we think, if once introduced, make a fine addition to their present stock of game birds.

The red-legged partridge (*Perdix rubra*) of France, was, about eighty years ago, introduced into England by the Marquis of Hertford and others, and has, in some counties, become very abundant. Its flesh is regarded inferior to *Cinerea*, but still is a great favorite with most sportsmen. We do not forget, however, that the winters in Old England are much milder than in New England.

The boon we devoutly desire is a migratory bird. Our native quail is a toothsome, prolific, cunning, gamy little fellow, feeding chiefly on seeds and grains in winter, most of which are within a foot of the ground, all of which are at any time placed beyond his reach by a fall of two feet of snow. Nor is he a good traveler upon light snow. But it so happens that every few years a deep, damp snow falls in the night-time upon the birds as they are huddled together in a little circle, heads out, and if at such time a sudden change in the weather takes place, so as to freeze the surface, they can never escape. The bones of whole bevvies have frequently been found as the snow melts away in the following spring. Nay, more; whole sections of country have in this way been depopulated, and then the anxious sportsman must wait long years till the few that escape in some remote corner have time to propagate and spread over the land so as to make good shooting again. The consumer fares better, as he can get a supply from the South or West. These considerations have led to the inquiry as to whether there is not some of the quail family better adapted to our inhospitable climate.

California quail (*Lophortyx californica*) are a very numerous bird along the Pacific Slopes of the mountains, as well as the plains, and at no distant day will, we trust, be transplanted to the Atlantic shores, where it is destined to become one of our most popular and interesting game birds. We understand they are partially migratory, *i. e.*, they travel from the mountain regions to the plains below, or to the seaboard, where there is very little snow, and return again in spring. They lay a great many eggs; in some instances as many as twenty-four, and to cover them, both parents incubate at the same time. Their food is quite similar to that of our quail, but they are more gregarious, often assembling in flocks of several hundred each. Another feature in their habits, and the one most favorable to their propagation here, is that, at the approach of evening, they run from the open fields to the thick oak forest trees, upon which they roost at night. If the habit of roosting on trees is universal, they would escape death by deep snows, and would certainly be a success here if they could be supplied with food. By introducing three or four new species of game birds, we should attract a portion of the gunners from their old haunts, and thereby make better shooting for those who remain; and, further, we shall have added something to our food supply, which is a subject worthy the attention of our wisest legislators.

Of all the game birds that have come to our notice, the one that has most good qualities and best adapted to succeed and prosper in this country, is the common migratory quail of Europe (*Coturnix communis*), or, as Mr. Baird prefers, *Coturnix dacrydionensis*. They are about two-thirds the size of *Ortyx virginianus*, generally lighter color or rufous brown, suffused with fulvous; bill slim, long and less arched; legs slender and nearly flesh color; wings larger in proportion than our quail, and the whole make-up more delicate. Their food is largely insectivorous, as their bills indicate. They lie well to a dog, and often do not all spring at once, but get up one or two at a time, and then give the gun an excellent opportunity to do its work. The bird is very common all over Europe, Asia and parts of Africa, going as far north as Scandinavia in summer to breed, but almost upon the first chill blast of autumn the warning note is given, and the little bevy is summoned to depart from the breeding ground to the more genial climate of the South. In September and October vast numbers of them are seen along the northern shores of the Mediterranean preparing for the long flight across the sea to North Africa, where they pass the winter, and, it is said, bring out another brood of young. The nearest point at which they would be likely to cross must be about 100 miles, which is a long flight for a bird with so large a body and so small a wing. Whether the two continents were originally more nearly united than at present, as is assumed by some of our savants, and the birds by the constant widening of the channel have been gradually educated to these long flights, is not a subject for discussion here. Certain it is that many on their passage are met by storms or adverse winds and perish in the sea. In April and May they return again in serried columns.

On this continent we have very little conception of the vast numbers, the multitudinous millions of these birds. They have been the marvel of all generations from pre-historic periods to the present day. The language of the Pentateuch, the Psalms and of the writers of ancient and modern times would seem to warrant any extravagant expression we might use. "And it came to pass that even the quails came up and covered the camp."—Exodus, xvi., 13. "And there went forth a wind from the Lord and brought quails from the sea and let them fall by the camp, as it were a day's journey on this side, and as it were a day's journey on the other side, round about the camp, and as it were two cubits high upon the face of the earth."—Numbers, xi., 31. "The people asked, and he brought quails and satisfied them."—Psalm, cv., 40. Bellonius says: "When we sailed from Rhodes to Alexandria, about autumn, many quails flying from the north to the south were taken in our ship; and sailing at spring time the contrary way, from the south to the north, I observed them on their return where many of them were taken in the

same manner." Bunstead in his very useful book for young sportsmen, entitled "On the Wing," uses the following language: "It is recorded that on one occasion such a quantity of them appeared on the west coast of the kingdom of Naples that one hundred thousand were taken in a single day, and all within the space of six miles; and on the island of Capri, not far from the city of Naples, so many were annually captured that they formed the principal source of the revenue of the bishop of that diocese, who, in consequence, rejoices in the title of the 'Bishop of Quails.'" Quail fighting was one of the amusements of the Athenians, and in Italy and China at the present time large sums of money are staked upon the issue of a single combat, the same as with us upon the success of our gamecocks. They are sold in Naples and other markets for one or two cents a piece, and their return each season is hailed with joy by the peasants, as aiding to patch out their slender revenues. We must say, in view of all this, that we have not been without our fears, lest, if they were introduced into this country, they would in time become so numerous as to "waste and havoc" our grain fields. The world is said to be governed by equivalents, and it is possible that, in the wisdom of Divine Providence, the Fox gun was invented about the same time that the project of importing these birds was conceived, by the use of which, and other improved breech-loaders, our agricultural interests may be protected from these devouring hordes. So thoroughly impressed were we in favor of this prolific little foreigner that he would fill a gap and furnish food for millions of our people, we set about finding some one who had been in Sicily or Southern Italy that could give us some positive and reliable information about them. For this purpose we visited several ship masters then in port, but none of them had taken the slightest interest in the matter, nor did they evidently care to. We came pretty thoroughly to understand that sailing a ship and shooting quail were quite different occupations and often developed dissimilar characteristics. We were about discouraged. At last we were put upon the track of Capt. P. M. Beal, of the bark Neptune, who had just arrived from Messina with a cargo of fruit and sulphur. The captain not being on board at the time of our call, we walked up and down the wharf, and as we gazed upon the tons of one part of the cargo, we were forcibly reminded of the lessons about the "bottomless pit" we received in early youth from our pious mother, and started for State street. A note soon brought us in contact with the captain, which amply rewarded us for all our trouble. He is a genial, intelligent, communicative gentleman, and withal an enthusiastic sportsman, generally taking on board a fine dog, with which, while in a foreign port discharging and taking in cargo, he manages to get a few days' shooting. He at once entered heartily into the spirit of our plan; had often shot the quail, knew their habits, and would aid us in every way possible. He gave the name of his friend and brother sportsman in Messina, Dominick Fisher, who would be likely to take an interest in purchasing and forwarding the birds to us. The next voyage of Captain B. was to the West Indies, and should we fail in getting the quail that spring, it was understood he would bring out two or three hundred on his next voyage to Messina the following winter. At once we addressed a note to Mr. F., from which we make the following extract:

Boston, March, 27, 1875.

Dominick Fisher, Esq., Messina:

DEAR SIR—Several sportsmen in this vicinity wish to try the experiment of introducing European quail (*Coturnix communis*) into this country. But "how are we to get them here?" This is the question that gives us most trouble. \* \* We would like to ask if, in your opinion, the birds can be obtained in numbers, say two or three hundred, and, if so, at what price? At what season of the year can it be done?

Very truly yours,

W. HAPGOOD.

We presume the letter miscarried, as no answer was received. We must now wait till Capt. B. makes his autumn trip, hoping he may get out before the birds migrate for Africa. He did not, however, arrive till near December, when no birds were to be found, and he returned in the spring of 1876 to relate his trials and receive our condolence. What then was to be done? We had worried through a whole year, and were no nearer the goal of our ambition than when we started. Shall we abandon the scheme altogether? No; we will "dwell in our necessity" till another fall, hoping our captain will get an early voyage "up the Straits," and our heart's desire realized. Not so; the gales that ushered in the autumn also wafted the "Neptune," with our coadjutor on board, to the ports of Beyrout and Alexandria. We might send an order to Messina, but our success hitherto in that direction had not inspired us with much confidence; and, besides, these birds require a great deal of attention. They must be fed and watered regularly, their cages must be kept clean, and they must be free from a liability to be wet with salt water. We might for a consideration secure the services of a steward to perform this duty, but if the birds were shipped via London or Liverpool, would that service be transferred with them to the ship for Boston or New York? Neglect, mismanagement, a few days' delay might disrupt our whole scheme. Rather than run this risk we preferred to take our chance of getting them at B. or A., as Captain B. had orders before he sailed to bring with him as many as he could, knowing as we did that they would receive the very best of care. He came very near securing 150 at Alexandria, but just as the prize was about to be eluded it slipped, and he came home in early spring empty-handed. Now comes another voyage to the West Indies, but previous to his sailing we instructed him to write to his friend Fisher to ship two or three hundred of the quail, dividing the lot, if he thought best, sending one moiety to New York and the other to Boston, or the whole to either place. They were to be consigned, care of Adams & Co's Express, to John H. Whitcomb, of Ayer Junction, Mass., who had from the very first been one of the warmest friends of the enterprise, for distribution. Late in May we had the satisfaction of receiving a letter from

our correspondent, so positive and hearty that we make the following extracts, which will sufficiently explain itself:

MESSINA, May 5, 1877.

WARREN HAPGOOD, Esq., Boston, Mass.

Dear Sir—In pursuance of a letter received from Capt. Beal, I hereby beg leave to inform you that I have to-day shipped by the Eng. S. S. J. B. Walker, bound to New York, two cages containing 350 quails, addressed to John H. Whitcomb, Esq., Ayer Junction, Mass., care Adams' Express Co. \* \* \* Hoping they will reach New York in good condition, I remain, dear sir, respectfully yours,

DOMINICK FISHER.

The J. B. Walker arrived in New York on June 5, but owing to some misunderstanding of A. & Co's Express, the birds were not delivered to Mr. Whitcomb until a week later. Mr. Fisher took particular pains to have a couple of nice cages made for the comfort and safety of our little pets, laid in a large stock of homestead for food, and for personal attention on the voyage gave the steward two pounds sterling, and otherwise took every precaution that friendship or interest could dictate. Whatever may happen to the birds, we shall ever feel grateful to him for his kindness. From some cause or other, 61 were lost on the passage, leaving us but 189 for distribution. By the best observers of the habits of quail, it is understood there is a law regulating their breeding. For instance: A section of country or even part of a township that is oversold, i.e., when there are already too many for the supply of food in that section, they will not pair or breed the following season, but will remain in flocks or hives. That food supply has great influence on the reproduciveness of both animals and man is a well established fact. It was therefore decided not to liberate all the birds in one place. They might find plenty of food to their liking in one town but fail to do so in another. Foxes or other enemies might destroy them in one place but not in another, and for the greater security, the more certain perpetuity of our little colony, they were scattered in several of the counties in the eastern part of the State.

The most serious objection to the division was that the plumage of the sexes is so nearly alike it was found very difficult to select them in pairs. And here let us pause for a word in explanation. It might be inferred from the foregoing that we claim to have originated and consummated the only plan for stocking this country with European quail. We wish it understood distinctly that we put forth no such claim. We have simply narrated our own griefs and joys—our own failures and final triumphs, not wishing in the slightest degree to detract from others, nor would it become us to attempt to portray the trials and annoyances of others who are much better able to do it for themselves, and yet we would venture a few words in this direction. The Hon. Martin G. Everts, of Rutland, Vt., we understand, had conceived the idea of importing these birds, and had actually moved in the matter as early, or even earlier, than the period at which parties here had begun to agitate or discuss the subject. His letters largely antedated ours, and although at first each acted independently and without the knowledge of the other, later it was known to each that the other was struggling to get the birds out for the purpose of colonizing, and each would cheerfully, if he could, aid the other. It was a most singular circumstance that after years of delay and disappointment, each operating through different agents—he through Consul Owens and we through Mr. Fisher, without any concert of action whatever—at last our birds should happen to be shipped on board the same vessel and arrive at the same time. And yet such is the fact. Of the two hundred birds invoiced to him only three were lost. By skillful management of transportation his birds were delivered to him and liberated a few days before ours were, and if any one is entitled to the credit of first planting in this country the migratory quail of Europe that man is the Hon. Martin G. Everts, of Rutland, Vt. And now the birds are here what will they do? They have frequently been seen since they were liberated, and it is thought they have mated or paired, which looks well for their future family relations, though we are not certain that any nests or eggs have been discovered. If they breed, will they in this new and strange land, as the winter draws near, with their little families, migrate? If they migrate, will they strike boldly out to sea, thinking they are to cross the Mediterranean and thus perish, or will they follow the coast line or a more inland route to Florida? Will they pass the winter there or cross over to Cuba and there intermingle with their non-migratory cousins (*Oryz. cabanensis*) and so mix themselves up with their mean relations as to lose their identity and forget to return? Or, again, will they nobly fulfill their mission and sustain the confidence we reposed in them when we brought them out of the land of Egypt? Or, still again, will they forsake their migratory habits and stupidly squat down here in the very jaws of relentless winter, where certain death awaits them? If they once go South to pass the winter and return the following spring our triumph is complete. But will they do this? "*Nous verrons.*" W. Hapgood.

Boston, July 28, 1877.

P. S.—Since writing the above a note from Mr. Everts informs us that the birds in his neighborhood have brought out several large broods, and he is quite sanguine of success.

W. H.

[The above has particular interest in connection with the article on Migratory Quail which appeared in our editorial columns last week. Advices from Rutland seem to indicate that the successful acclimatization of the European quail is assured. We hope that success will crown all efforts in this direction; and also that more of our public spirited sportsmen will engage in this enterprise.—Ed.]

RESTIGOUCHE SALMON.—We are indebted to our friend H. L. Leonard, of Bangor, Me., for two fine salmon caught by him in the Restigouche. They were preserved at J. Porter & Co.'s freezing establishment, at Campbelltown, Nova Scotia, and reached us as fresh as the day they were taken from the river. They were quite three feet in length, and the two weighed nearly seventy-five pounds. It must not be supposed that our gastronomical abilities were sufficient to utilize all of Mr. Leonard's magnificent present. The associate editor has not been able to draw a long breath since, and the staff, generally, are rapidly assuming Lambertine proportions.

—On the island of Orkney lately, the leader of a flock of geese took refuge during a storm upon a ledge overhanging the sea. The rest of the flock, twenty in number, thinking that the leader had jumped into the sea, leaped over and were drowned.

## STRAY NOTES FROM THE EDITOR.

PITTSBURG, Aug 4, 1877.

What a romantic and charming locality Pittsburg must have been before the purity of its atmosphere was tainted by the smoke of the thousand fires kindled among its hills and ridges, and the face of its natural beauty was smothered with lamp-black and soot! When the old Monongahela flowed in the full and unrestrained volume of its excellence, and was not hooped into hogheads to be busted open by unconscionable rioters and incendiaries! Alas! what a desolation these irrepressibles have created. The traveler who comes from the East has to elbow his tiresome way through three miles of total destruction and heaps of rubbish still smoking and smouldering. I have never before seen such concentrated loss, and I have gazed upon the ruins of many conflagrations. A thousand laborers are now engaged in preparations to re-suscitate; and a thousand volunteers and regulars are here to protect them, quartered in the court house and barracks, and thrown out to the right and left as pickets and patrols in the old-fashioned way, so familiar to all who participated in the great struggle a dozen years ago. One learns to love the soldiers when he needs their protection ("I love the military").

Last night I attended the monthly meeting of the Sportsman's Association, at their spacious headquarters here, and learned with satisfaction that its members have stepped to the front in almost solid phalanx, and enrolled themselves as a military company, 107 strong, under the title of the "Sportsman's Guard," and under the command of Maj. Gen. J. B. Sweitzer, with several veterans of the regular army as officers. They will be armed with shot-guns loaded with buck-shot, and I'll guarantee will be able to disperse a mob with these weapons quicker than with bayonet and rifle. The FOREST AND STREAM once suggested the manufacture of a big-cylindered, burglar-repellant pistol that would throw shot. For mobs and shooting in the dark, scatter-guns will beat rifles in and out.

The Sportsman's Association here was organized 1874, and now has about 200 members. It is a body of earnest game protectors, and so great sticklers are they for law and equity that they are discussing the expediency of expelling, for shooting birds out of season, one of its own members, who happens to be a Chief Justice, which is going behind the bench with a vengeance. The club has one of the finest natural history collections in the country. Its officers are Robert Daltz, President; D. C. Phillips, Vice-President; John A. Harper, Treasurer; O. F. Wharton, Secretary. It has also an attorney and a naturalist, which all clubs ought to have.

In coming on from New York yesterday I fell in with ex-Gov. William Pitt Kellogg, of Louisiana; and as I found him attentively studying a copy of "Hallowell's Sportsman's Gazetteer," I inferentially concluded that he was not so bad a devil as politicians had painted him. He informed me that he was posting himself on angling gear, and intended to give politics a long rest and engage in bass fishing in Minnesota lakes. We hope his lines may fall in pleasanter places than of yore.

I don't hear of any great amount of game along the line of the Pennsylvania Railroad between this place and New York. However, they do say certain game was plenty about here a fortnight ago, when the citizens made the rioters quail. Rail shooting also good—along the track—though altogether out of season. The club proposes to give especial protection to rails hereafter.

I start for Grand Rapids this afternoon.

HALLOCK.

THE GAZETTEER.—THE SPORTSMEN'S GAZETTEER was duly received, and myself and many of our best judges in sporting literature have critically examined the book, and all unite in pronouncing it the most valuable work ever issued from the press on kindred subjects. It is a wonder to all how so much valuable information could be so intelligently crowded into a book of its size. The task must have been very great, but has been accomplished in a remarkably concise, intelligent and pleasing manner. Every page demonstrates the fact that the author was competent master of his subject. No sportsman or tourist can afford to be without the book, and it ought to be, and no doubt will be, read generally by the masses, and certainly by all interested in the study of natural history.

Lake City, Minn., Aug, 1, 1877.

DR. D. C. ESTES.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grilse and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining, to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box, 1,294.—(Ado.)

ABBEY & IMBERIE, 43 Maiden Lane.

## The Rifle.

QUEBEC RIFLE ASSOCIATION.—The programme of the Ninth Annual Prize Meeting of the Province of Quebec Rifle Association will open at the Point St. Charles ranges, Montreal, on the 21st inst., and will continue several days. Eleven competitors are on the list, all the prizes being in cash. The first seven matches are for Snider rifle shooting; competition VIII. for the Strangers' Stakes is open to Sniders at 500 and small bores at 800 yards. In the Ladies' Stakes the small bores fall back to 900 yds. The third match, open to any rifle, is for the small-bore championship, 15 shots at 1,000 yds. Were it not for the work of preparing to meet our English friends, several of our Creedmoor shooters would doubtless pay a visit to Point St. Charles and try their hand in the all-comers shoots.

CONNECTICUT, New Britain.—At the shooting on Saturday, the 28th ult., a new member, Mr. W. H. Binns, of Hartford, took the champion long-range badge for 1877. At 800 yards he made 44, at 900 yards 43, and at 1,000 yards 39, total 125 in a possible 150. C. O. Case, of New Britain, scored 121; William Parker, New Britain, 120; W. H. Layne, New Haven, 117. At the 500-yard range, H. P. King, of New Britain, won the mid-range champion badge on a perfect score of 50—ten straight bulls eyes. Mr. King is the winner of the badge for the second time.

MASSACHUSETTS—Fitchburg, Aug 4.—At the rifle shoot held by the Sportsman's Club of this city, Mr. W. B. Haskell made 48 out of a possible 50; Mr. A. E. Robbins, of Gardener, 43, and W. W. South and S. N. Choate of Fitchburg, 40 and 39 respectively. Distance 300 yards. DER FREYSCHUTZ.

## THE ELCHO SHIELD MATCH 1877.

SOMEHOW or other our London exchanges find very little space to give the details of the shooting for the Elcho Shield on the 19th ult. It could not surely have been that the details were rejected because of the poor shooting shown, for better scoring has never been done in the Elcho Shield matches; and we will not be so rash as to assert that the fact of an Irish victory in any way influenced the London editorial mind to boil the event down to a mere paragraphic notice. The *Daily News*, however, looked upon the event as news and treated it accordingly, giving the usual full scores.

The day was a good one for rifle shooting. There was a shower or two. Rain and sun alternated in what we should consider a confusing manner, but the Britishers were at home, and did not care for such trifles.

In the early hours the atmospheric conditions were wholly favorable for spectators to witness the stages of the Elcho Shield. Around this the interest of all marksmen centred, and rarely have they had an opportunity of witnessing grader shooting than that of the Irish eight. This team led at 800 yards by 13 points above the Scottish, and 30 above the English. They increased the lead at 900 yards, where their total was 60 points higher than the Scottish, while England had pulled up four points, and stood with 991 against the 1,000 scored by the Northerners. But it was at the long range that the great superiority of the Irish team was manifested. Shot by shot they crept away from their opponents. Shot after shot the white disc hung in the centre of the target, and bull's-eyes seemed to fall for them as thick as leaves in Vallambrosa.

The unerring accuracy of every man's aim was perfectly wonderful, and the people pressed close around to see the man whose limbs seemed to possess the rigidity of iron, and whose nerves were susceptible to no external influence. At 800 yards one of the best marksmen had his best recorded against him, but this, the only one in all their 360 shots, and therefore every man of the team seemed to be endowed with the steadiness of a machine. Changes of light and fickleness of wind influenced them scarcely a whit, and, judging by results, not a rifle could have quivered a hair's-breadth, or the shots could not have clustered so thickly round the central black. Mr. Banks and Major Young each scored 66 at this range, the former putting on eight bull's-eyes, five inners, and two naggies, and the latter nine bull's-eyes, four inners, one magpie, and an outer. These were the highest scores of the Irish team at 1,000 yards, but in the aggregate at these ranges Mr. Wilson took the lead with a score that has never been surpassed, he having made 202 out of a possible 225. Next to him was that prince of small-bore marksmen, Lieut. Fenton of the 77th Regiment, with 201. Mr. Banks scored 200 altogether, and Major Young 199. While the Irish were surely and steadily creeping away from the other teams the English were gradually becoming the lead of Scotland. There had been nine points difference at the previous range, this was decreased a point or two in the first round at 1,000 yards, but increased to 12 by a sad falling off in the English shooting in the next round. Then, however, Scotland began to lose ground again, while the English pluckily struggled to court the lead from them, though there was hardly a hope then of getting up with the Irish. At the seventh round there was a murmur of applause from the Saxons gathered behind their countrymen, when the numbers went up, and England was found to have headed Scotland by two points. Henceforth this lead was increased at almost every round until Scotland was twenty-five behind England. The totals made at this range were: Ireland, 510; England, 473; Scotland, 439. Though the aggregate of two or three Irish marksmen were the highest by several points for all the ranges, the best scores at 1,000 yards was the 69 made by Lieut.-Col. Fenton, of the English team, whose fifteen shots at that distance were placed within a circle of about four feet diameter. He made nine bull's eyes and six inners. When the last shot had been fired, and the throng of spectators saw recorded for Ireland the highest total ever made for the Elcho Shield, a wild cheer burst from the Celtic throats, and Englishmen joined quite as heartily, if not so demonstratively, in acknowledging the grand shooting by which the Irish team had placed themselves more than one hundred points ahead. After a brief delay Lieutenant Menzies, speaking on behalf of the Scotch team, in the absence of Mr. Malcolm, congratulated the Irish on their brilliant success, and expressed a hope that before long every prize at Wimbledon, including the Queen's, would be open to our gallant brothers from the Emerald Isle. The Duke of Abercorn responded, and repeated the opinion he expressed last year, that the Elcho Shield would be none the worse for a trip across the Irish Channel, at all events they would keep it among them as an honored guest as long as they possibly could. He asked Irishmen and Scotchmen to unite in three hearty cheers for the English eight and their captain, Mr. Wells, whose absence all regretted. Mr. Parsons, the adjutant of the English team, replied, and proposed three cheers for the Scottish team. He hoped that those who had shot so splendidly that day would represent Ireland in America this year, and wrest from the enemies the laurels they so hardly won at Creedmoor last autumn.

my thoughts, I caught a glimpse of a small, dark body darting swiftly along the road, and partly hid by the overhanging grass which shaded the track. Touching the horses a little the object moved faster, until, just before taking wing, I saw it to be a fine, plump hen-grouse, and a moment after she started, her brood of ten followed her from the grass by the roadside, and went whirling away a short distance. How their hurried leave-taking reminded me of the rare sport I should have in bringing them to bag later in the summer, when in their mature strength and chary of being approached by man or dog; only then is the acme of grouse shooting reached. Ducks are not nesting with us as much as usual; in fact the summer fowl become more scarce every summer, and we are here rapidly approaching the time when ducks in August will be looked upon as a thing of the past, although our immense marshes remain intact. The onward march of civilization seems to steadily press back the feathered tribe with their four-footed friends. A few years since, at this time of year, one could see numberless ducks and geese in the open water of the large marshes, and always followed by a troop of downy young, which they were drilling to act their respective parts in this great world. But now the ducks are rare and geese scarce, though as yet the nesting grounds are not far removed to the northward, so that by the time the grain is well off the fields we will be able to try an occasional shot at the young geese, as they come in to feed on the stubble fields; they are then quite tame and are comparatively easy to approach, and are among the primeest of our game. In the early summer, when out collecting with my boat, I found a nest of the goose, on a muskrat house, containing four eggs and one gosling. The latter I appropriated, and thought to bring him up by hand, and succeeded in keeping him about three days, during which he grew tame, and ate well and was doing finely; but one evening, about sundown, being left out of his box for a few moments, he was suddenly among the missing, and has not since been found. Whether Grimaldin had come slyly along and made her supper off him, or whether he betook himself to his swampy home, deponent saith not. Since his departure I have not seen or heard a goose in these parts, where seasons before they were in the habit of staying all summer long and rearing their young. A solitary pair of great white cranes were seen almost daily until their nest was collected, when they, too, left for parts unknown. Grasshoppers, which bid fair to destroy everything again this summer, are now all gone, and the farmers are jubilant over their finely growing crops. For the last two weeks the "hoppers" were seen flying over, going with the wind, but not in such numbers as to give serious cause for apprehension, even if they stopped, which they showed little disposition to do.

ABE DACOTA.

Vail, Iowa, July 30.—Prairie chickens will be ripe here Aug. 15. Heretofore they have been picked green; this year they are being protected. E. B. B.

Mason City, Iowa, July 28.—Pinnated grouse are plenty here this season. O. J.

NEVADA.—Elko.—There is promise of unusually fine hunting in the vicinity of Elko this season.

GLASS BALL PIGEONS.—Oconomowoc says that in order to give the Bogardus glass ball some semblance to a "bird" when sprung from the trap, it is only necessary to procure a suitable number of corks to fit the neck of the ball; then, with the aid of a bradawl, place in the cork half a dozen large "rooster feathers," with sufficient spread to form some likeness to a bird's tail. It is surprising how much this little illusion helps the shooter. As the balls are broken the "feathered corks" can be inserted into others, and the stock of pigeons can thus be kept up until the supply of balls is exhausted. No patent.

—To keep birds in warm weather, put each between a couple of candock leaves to keep it cool. Have some ground coffee with you. Open the bill and thrust a quantity of the coffee down the bird's throat, place some among the feathers between the legs and tail, then put some under the wings, and tie the wings down tightly to the body. By observing these precautions, they can be preserved for several days. A lump of charcoal put into the cavity after the birds are drawn is even better.

#### PIGEON MATCHES.

FITCHBURG, Mass., Aug. 4.—The Fitchburg Sportsmen's Club held their second shooting match at the fair grounds to-day. The following are the best scores in the ball trap shooting, 10 balls at 30 yards, ten yards apart: W. S. Jones, Ayer, 10; F. D. Whitaker, Fitchburg, 8; S. W. Putnam, Fitchburg, 7. Prizes of \$10, \$5, \$3 and \$2 were awarded. G. W. Cann won the fourth by shooting off on the tie.

DER FRESCHUTZ.

NEW YORK, Ocean Parkway, Brooklyn, Aug. 2.—A return match between the Fountain and Midway Gun Clubs was shot as above, resulting in a tie of 78 birds out of 100 for each club. The rules of the Fountain Club under which the match was shot provided that ties must be shot off, three birds each. This match was, however, left a tie, the result to be determined at a future date. Following is the score:

### BOATS AND BOAT-BUILDING—3d Paper.

#### A SCOW OR BRIGG—SAILING YACHT.

PROCURE two boards for the sides, of sufficient length to make the boat eighteen feet long over all when finished; they to be one or one and three-fourths inches thick, and eighteen or twenty inches wide. If boards cannot be procured of the right width, two may be used to form each side by joining the edges and fastening the one to the other, by cleats of oak an inch and a half square, which must run across the full width of both boards, and be firmly united to them, these cleats to be placed fifteen inches apart. If the sides are made of two boards with cleats, one inch will be sufficient thickness. Cut a piece of board for temporary, middle, or "mould board,"

seven feet long and fifteen inches wide; give from four inches to a foot of bevel, leaving one edge of board seven feet long, and the other but six feet two inches. Cut the ends of side boards to the curve of a radius of about eight feet, leaving the extreme ends of side boards four inches wide from curve to top edge, or gunwale. Set the side boards up in the same manner as directed for small scow, and draw the ends together until of a width to suit the fancy of the constructor. For myself, I would prefer to leave them five feet wide at stern, and four and a half at the bow. Stay lath and square up the boat, and reduce the convexity of the bottom from one curve to the other, leaving the middle of the boat's length nearly straight. Bevel down side boards and nail on the bottom, which should be composed of one-inch boards; finish bottom to ends as heretofore directed. Now cut out two pairs of natural "knees" one inch and a half thick, and of sufficient width to retain full strength in the angle of the knee. Fit them to sides and bottom at the point where the end curves join the straight line of bottom of boat, this will be found to be about four and a half feet from the ends. Rivet and nail securely in place.

For the "centre-board," procure two boards equal in width to the depth of middle of boat, and five feet in length and one and a quarter inches thick; to one edge of each nail or rivet a piece of oak two by three inches, and of the same length as boards. Now set the two boards alongside one another, the sides on which the oak strips are fastened being turned to the outside; between the ends of boards at each end of trunk place a piece of oak or yellow pine one and a fourth inches square, and see that strips of cotton cloth, smeared on both sides with thick white lead, are placed between these strips and the sides of trunk; rivet the ends securely together through the end pieces and trim projecting ends smoothly; and if not already so, make the bottom of trunk square and straight from one end to the other. Remove the "mould board" and draw a line on the inside of bottom exactly in the middle of the boat. Set the trunk on this line so that one-half its thickness is on each side, placing so that it will measure six feet seven and a half inches from the front end of trunk to the bow; mark with a pencil the outline of trunk on the bottom, when remove the trunk from boat. Inside the lines marked around trunk on bottom of boat, lay out lines to correspond to the opening in trunk; these lines have to be sawed through the bottom to allow the centre-board to pass through. Leaving this for the present, take two boards eight inches wide and one inch thick, and place one on each side of the markings of outside of trunk, and nail with clinch nails; these boards extend lengthwise the boat from one pair of knees to the other, and the trunk fits snugly between them, when the opening for centre board may be sawn out. Before fastening the trunk in place, it is best to make and fit the centre-board; for this, use three-quarter inch pine stuff, or oak or cedar will do. Make the forward end of centre-board an inch wider than the depth of trunk, and the back end a foot wider than front; the boards forming the centre-board should be "doweled" together—that is, holes are bored in the edges of the boards, and wooden pins driven in so that the boards cannot warp or spring from one another.

Three inches from bottom edge of centre-board at the front end, and the same distance from the end itself, mark a point or centre, from which strike the curve of a three-inch radius from bottom to the end, and cut the corner off to the line described, using the same point as the corner off to the line. A similar curve from the lower back corner of centre-board, all the way across the wide end to the top edge of board, and cut the end to the line marked; then through the centre itself bore a five-eighth or three-fourth inch hole. Have two strap-irons made—one for each end of centre-board—long enough to extend around the ends and lap at least six inches on the top and bottom of board; make the strips of iron three-fourths by three-sixteenths of an inch, and have holes drilled and counter-sunk every three inches, so that they may be fastened on the board with screws; where the strap laps over on the top, at back end of board, have an "eye" riveted on, through which a rope may be fastened to raise and lower the centre-board. On each side of the bolt-hole fasten iron plates with holes corresponding to hole through the board. When completed, this centre-board should be an inch shorter than the opening through the trunk in which it is to work, as this will allow a half-inch play at either end. To find the place for bolt-hole through the trunk, mark two inches back from its lower edge, and back from the inner side of end piece three and a half inches. Now bore the hole of the same size as that through centre-board; it is better to mark and bore from both sides of the trunk, as by that means you will be more likely to have the hole true. Procure a bolt of proper size and length, provided with a good iron washer for each end, and also two washers of rubber, you place the rubber washers between the sides of trunk and the iron washers, so that the bolt, when put in place, will not allow any water to pass. After everything is fitted so that the board works easily, without binding anywhere, the centre-board is removed from the trunk, and the trunk fitted in its place on the bottom of boat as before directed; place between its bottom and the bottom of boat strips of coarse cotton cloth smeared on both sides with thick white lead, and nail through the bottom of boat; also place four screw-bolts through bottom and side pieces on trunk in each side, and secure by washers and nuts. The trunk is now further secured and may be stiffened by placing transverse cross-seats at each end of it. "Notch" in a couple of inches, so that the trunk will fit in the notches. Secure them strongly in place.

At each end of boat is to be fitted the "deadwood," marked (a) in diagram; its purpose is to steady the boat, to give more immersed section, and also to stiffen and to provide a place to hang the rudder to; make these of one and one-half inch stuff, which must be cut to fit the curves of boat, and nail firmly in place through the bottom boards. The piece at stern is deeper than the bottom of boat, for the purpose of immersing the rudder more deeply, thus to give a better "hold" on the water. Make the stern-piece four inches deeper than the straight line of the bottom of the boat, narrowing it down until it ends just back of the rudder; then have strap-irons made one-quarter inch thick and of the proper width, with the ends of the straps in the form of a T. Now fasten the straps around the deadwood with screws, and four inches above the bottom at stern have a half-inch hole drilled through the strap, and three or four inches into the deadwood, into which screw an iron with an eye formed on the end. The hole through this eye must be a half-inch diameter, this iron screwed in until the eye is one and a fourth inches from the strap, measuring to the centre of eye; on this the rudder hangs. The rudder may now be made and fitted, and for this purpose we take one and a half-

inch oak, except for the rudder post. The piece for rudder post should be six inches wide, two and a half inches thick, and of sufficient length to allow for the mortise for tiller above deck. Shape as shown in diagram. The top part of rudder post, as far as it passes through the stern of boat, should be made round, two and a half inches in diameter; below this it is flattened down until it conforms to the rest of the rudder. The rudder should be two feet in length, and fastened together by half-inch iron rods running through the edges of the boards, as shown by the dotted lines in the diagram. The holes for the rods must necessarily be true, and it is best to mark the boards from each edge, and one-half way through from each side; by this means the holes will meet one another squarely. At the proper place on rudder post we now cut out a notch, and fit on an iron with a half inch pintle, to fit eye on stern deadwood. The rudder-head requires two iron bands, one above and one below the mortise in which the tiller is placed, or a band can be placed around the whole rudder-head long enough to include the mortise, which is cut through it; this last being the best. Cut a hole through the bottom boards at stern; large enough to allow the rudder-head to pass easily to place, and around the rudder post where it passes through the boat, fit a wooden box to the bottom, making the box large enough so that the rudder can be taken out easily; nail the box securely to the bottom and make water-tight. When fitting on the deck cut the board in front of rudder-head so that the rudder will incline enough to be easily removed, and finish by having an iron or brass plate on the deck with a hole cut through of size just sufficient to allow the rudder head to fit nicely; fasten plate to deck with screws. Lay the deck with narrow boards two inches in width and three-quarters thick; the deck can be arranged to the builder's fancy, but on the sides should be at least a foot wide and at the bow must extend back far enough to include the step for mast. The deck beams may be made of inch boards three inches wide; make the "rise" of deck from a half to three fourths of an inch per foot; of width, placing the beams one foot apart, those at the mast to be double strength and braced with "knees" at each end. Put in a wide deck plank of oak for the mast to pass through, using inch or inch and a quarter stuff with its edges beveled down to correspond in thickness to the other deck planks; fasten it firmly its whole length, and to the two heavy deck beams bolt it with screw-bolts; the deck boards are put on lengthwise the boat, around the sides of "cockpit." Nail an inch board, allowing it to extend downward as far as the bottom of deck beams, and rise above four or five inches. At each end of cockpit nail similar boards crosswise the boat, fitting the ends neatly to the side pieces, when the "combing" is completed. A floor may now be fitted in the boat, or not, as is desired. Arrange seats as wanted. Cut the hole for the mast in the centre of the boat's width, three and three-fourths feet from the bow of boat. Make a "step" for bottom of mast of two inch plank, which must be fastened very firmly on the bottom of the boat, directly beneath the hole in deck. At the stern, back of rudder-head should be fastened, crosswise the boat, an iron rod with its ends bent down about three inches, and so formed that it can be firmly fastened to the deck; this is called the "travel." A pair of rowlocks may now be inserted in blocks fastened outside the "combing"—oars nine or ten feet long should be used. Fasten a ring to bow of boat for painter. A small rope should be fastened to the eye on top of centre-board, of a length sufficient to allow the top of centre-board to descend to the bottom of trunk, or a little lower; on the end of the rope is placed a wooden button or ball, large enough to prevent it passing through the opening or "well" in trunk. When the centre-board is raised, it is kept up by passing an iron pin through a hole in back of end of centre-board, the ends of the pin resting on top of the trunk. This pin has an eye at one end in which a small chain or cord is fastened, the other end being attached to the side of trunk to prevent the loss of pin when not in use.

The diagram shows shape and dimensions for a suitable sail, which should be made of heavy drilling or light duck, the seams being formed by lapping the edges of the breadths one on the other and sewing both edges in that position. The stitch used is similar to that which ladies call a "hem," only coarser stitches, one-quarter of an inch apart or more. The different "breadths" are also to be "bighted" or seamed once through their middle lengthwise, forming the seam in the same manner as at the edges, that is, doubling it over on itself an inch. For sewing use sail twine, though good hard laid wrapping twine will answer as well. The seams should run parallel with the "leach," or outside edge of sail. Lay the cloth on a floor and shape carefully as shown on diagram, turning a hem all around the edges two or three inches wide. At each corner sew on an extra thickness of cloth, extending across the corners six or eight inches, and also sew on an extra thickness at the points where the reef-string will come on "leach" and mast. In the corners of the sail place large brass grommets or "eyelets," and also in the places where the extra thickness of cloth was sewed on. On the edges which lie along the boom and gaff place small brass grommets one foot apart; along the mast edge of sail they may be five inches apart. Sew on the edges of sail a half inch hemp rope, which should be drawn around over the ground for some distance before using, in order to take out the extra twist; when the rope is perfectly dry, fasten the edge

of the sail to the rope without stretching the sail any, at distances of a yard or so apart; this will serve as a guide when sewing and prevent "drawing in" the sail. On the "leach," i. e., the edge running from the boom to point of gaff, it is best to take out a little more twist from the rope by untwisting it slightly. Some prefer to sew on the rope down a foot or so from the gaff, and then pass it through an eyelet hole to the inside of boom and run it down to point of boom; thence pass it through large grommet, and finally bring the end along the boom inward, far enough to reach handily, at which place it is fastened to a "cleat" on side of boom. By this method, if the "leach" of sail at any time is too long or too short, it can be remedied by altering the length of rope. The mast and booms are best made of spruce, though pine will answer well. The boom is three and a fourth inches diameter in its middle, and tapers to about two inches or so at the ends. The gaff-boom must be two and a fourth inches at middle, tapering to one and a half and one and three-fourths at the ends. The "throat" or end of boom at mast is shaped as shown in diagram. The gaff is shaped in the same manner. On the upper side of boom, and on the under side of gaff, nail on edge strips of wood three-fourths by three eighths inches extending from one end to the other, through which holes are bored and cords run, and through the grommet of sail to fasten it to the booms. The corners of sail are more securely fastened to booms by passing a stout cord around boom at outside end, and nailing a small block back of cord to prevent its slipping. The corner at throat is fastened by boring a hole down through the end of the boom and fastening the cord through it. Wooden or iron rings are used on mast, but wooden ones are preferable, and they must be large enough to run freely. Blocks are fastened on mast and booms as shown in diagram, the upper block being a double one, while the rest are single. The blocks on mast may be fastened to "eyes" in iron rings around mast at the places shown. The blocks may be either of wood or metal and of a size to take a half-inch rope—the block on the boom a single one, and that on the travel double. The "traveller block" is fastened to a loose ring on the "travel." Mast four and a half inches diameter at deck, one and three-fourths at the top, and of the length shown in diagram. The ropes for hoisting sail are passed through blocks or eyes screwed in deck, one on each side of the mast, and then carried to the cockpit, where the ends are fastened to "cleats." Make two rows of eyelet holes in sail parallel with boom, and about three feet from it and from one another, in which fasten reef-strings, so that one-half the length of string is on each side of the sail. Make the tiller of tough oak, or it may be made of iron.

This sail will require an anchor of twenty-five pounds. The "centre of effort" of the sail, and the "centre of longitudinal section" (terms which will be explained in a future article) lie nearly in the same vertical plane when the centre-board is up, and but one person in the boat. When the centre-board is down, the boat will have considerable weather helm. This is the only safe and agreeable way of adjusting the sails to any boat. Use 250 or 300 pounds of ballast. For small boats the best ballast is clean gravel, placed in strong canvas bags, six or seven inches in diameter, and about fifteen inches long. Distribute the ballast, whether passengers or gravel bags, in such a manner that when "beating" to windward, it will require the tiller to be held over to the "windward" side (or side turned toward the wind), at a small angle with the vessel's "course." When trimmed right, the vessel will head up in the wind when the helm is removed from the tiller. Above all things, if you value your safety, never sail any boat that has a "lee helm," that is, one in which the bow of the boat will swing around with the wind when the rudder is left to its own guidance. With such a boat there will be considerable difficulty in going about, or changing to another course, and if caught in a squall, the probabilities are that you will upset. If the boat has a lee helm, shift ballast forward until there is a change to "weather helm." If there is too much weather helm, shift the ballast toward the stern of boat until the tiller will be required to be put over to windward, only a small amount to keep the boat on her course. The directions given for a scow will also answer for a sailing skiff, the only difference being the bow. Directions already given for rowing skiff will sufficiently explain this point, otherwise proceed as directed for scow. On the diagram of sail a rope is represented running from point of boom to top of mast; this is called the "topping lift," and its purpose is to help support the boom; it can be omitted, but is of considerable convenience, and we would recommend its use. Either a sailing scow or skiff will make a very good boat on inland waters where there are no large waves, but in sailing on rough waters or ocean billows they are dangerous, and we would advise no one to use them in such places.

**NEW YORK YACHT CLUB.**—The annual cruise of this club was begun yesterday. The programme contemplates a run from Glen Cove to New London, thence to Greenport, New Bedford, Oak Bluffs and thence to Newport for the club regatta. Notable features of the cruise this year are the presence of the steam yachts, a series of handicap races from port to port, and the presentation, to take place at Shelter Island or Newport, of an elegant silver punch bowl to Mr. J. R. Dickerson, of the schooner yacht *Madeleine*. This is to be a testimonial of regard from the club members to Mr. Dickerson for the service rendered last year when the *Madeleine* contended as champion schooner of the club against the schooner *Courtesy* of Dufferin, of the Royal Canadian Yacht Club, for the possession of the American cup.

**NEWBURGH BAY YACHT CLUB REGATTA.**—*Newburgh, Aug. 1.*—The fourth annual regatta of this club was sailed Wednesday afternoon, Aug. 1st. The weather was most propitious; the breeze was a stiff northeaster; the docks, river banks and excursion steamers were crowded with throngs of many thousands of spectators; the arrangements for a successful regatta were most admirable, and admirably carried out, and the regatta a success. The prizes were: For first-class, \$75 first, a marine glass second; for second-class, \$50 first, a barometer second; for third-class, \$50 first, set of colors second; for fourth-class, a silver plate; for catamarans, a pennant; and a special prize of \$150 for the boat making the best corrected time. The course was from an imaginary line drawn from the judges' boat, off the long dock at Newburgh, crossing it from the north; thence to and around mark boat No. 1, off the long dock at Fishkill; thence to and around mark boat No. 2, two and one-half miles' south, turning from east to west; thence to and around stakeboat No. 3, two and one-half miles north of starting point, turning from west to east; thence to and around stakeboat No. 4, anchored opposite the foundry at Fishkill, turning from east to west; thence to and around stakeboat at the starting point, turning from north to south; going over the course twice. The result was as follows:

| Name.            | FIRST CLASS.  |          | Corrected time. |

**CATAMARANS ON THE LAKE.**—Hartman Talbot, of the Port Huron Commercial, is "doing" the Great Lakes with a catamaran, cruising leisurely along the coast from Port Huron or Chicago.

—Wallace Ross, who recently defeated Plisted, of New York, and Smith, of Halifax, has challenged Morris, of Pittsburg, Courtney, of Union Springs, N. Y., and Hanlon, of Toronto, to a race of three, four or five miles, \$500 or \$75,000 a side. In case either of the challenged parties refuse to accept, the challenge is open to any American.

—The amateur sculling championship of the Thames has again been carried off by T. C. Edwards, Mass. The distance was three miles, and the time 24m. 43s.

—The Long Branch Rowing Association regatta comes off at Pleasure Bay on or about Aug. 15th.

**Tiffany & Co., Silversmiths, Jewelers, and Importers,** have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their Timing Watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & Co.,** of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

# HUBER & MERWIN'S CHAMPION BALL TRAP.

We call the attention of the fraternity to the above trap, claiming to be the *plus ultra*. It combines compactness with durability, and is arranged, by a swivel on the bed-plate, to throw a ball in any direction or at any elevation unknown to the shooter, a screen preventing his seeing the direction in which the trap is set.

The spring, as the cut will show, is made of steel rod or wire, bent spirally at the point of attachment, thus receiving the concussion its entire length, and preventing breakage.

FOR SALE BY  
**BARTON & CO., Sole Agents,**  
357 BROADWAY, NEW YORK.

This certifies that I have used every trap in market, and find the CHAMPION GLASS BALL TRAP for durability and perfection of its operation, superior to them all, and take pleasure in recommending the "Champion" to sporting clubs and my friends.

## SAFETY REIN HOLDER.

The handiest thing out. It saves time; prevents accidents; looks well; is not in the way; is easily adjusted, and fits any teacher. Sent, post-paid on receipt of one dollar. **SAFETY REIN HOLDER** Co., Portland, Maine.

**Folding Pocket Mosquito Bar.**

Most ingenious device for campers, tourists and travelers. Can be used at home or abroad, and will last a lifetime. It weighs less than a nickel, and is trouble to carry. Can be put up or taken down in half a minute. No camp outfit complete without it. Every one warranted. All complete, with net, \$1.50. Sent on receipt of price. Address **A. A. COWING,** Watkins, N. Y.

**PERFEZIONE** strengthens, enlarges and develops any part of the body; st; Nervous Debility Pills; st; Invigorating Pills; st; all postpaid. Address **DR. VAN HOLM,** 161 Court st., Boston. Mass.  
Aug 9

**Bond's Improved Section Boat.**

There can be no greater portability without serious defects. Sportsmen will find these boats superior to all others. For winter sport in the South they will be found especially useful.

## LEESBURG ACADEMY.

An English classical and mathematical school for boys, Leesburg, Loudoun Co., Va. Principal, Thos. Williamson (Univ. Va.); Asst. Thos. S. Purdie, B. L. (Wash. and Lee Univ.). Leesburg is within 30 miles of Alexandria and Washington, on Washington and Ohio Railroad, in the Piedmont region of Virginia, proverbially healthy. Pupils prepared for the universities, any standard college, or for business. Board, with tuition in Latin, Greek, mathematics, etc., ten months, \$210. Day scholars, \$40, \$50 and \$60. References—Faculty of University of Virginia, Faculty of Washington and Lee Univ., Faculty of University of South, Faculty of Randolph Macon College, R. L. Gildersleeve, Ph. D. John Hopkins University; Hon. J. Rand Tucker, Hon. Eppa Hunton, etc. For further information apply to **THOS. WILLIAMSON,** Principal Leesburg Academy, Leesburg, Virginia.

## Wanted.

### A Partner Wanted in Florida.

A situation as full partner in an establishment of forwarding Florida oranges. Market all secured: the only work is Receiving, Counting, Boxing and Shipping. The business pays from 100 to 200 per cent. profit. The party must not expect to hunt or fish but a small part of the time, although fish and game are abundant. To a person slightly aiding the position would be very desirable, as the work is light. The location is on the gulf coast, just below Cedar Keys. The business would pay for two others, as we have to hire two or three (as last year); but each must have at least \$1,000 cash in hand to take with us immediately on notice of shipments. Sight drafts will be honored in Boston. Everything reasonable and of the highest order, and connected with an old established house in Boston controlling the best of the trade. Address, immediately, P. O. Box 450, Putnam, Conn.

**WANTED.**—A 16-foot six strip bamboo rod. For Sale.—A 10-gauge, 30-inch double barrel breech-loading Wellington gun, with all the fixings. Address **FRANKLIN,** at this office. Aug 21

G. P. & T. Agent, Detroit.

## TROUT FISHING!

## The Wisconsin Central Railroad

THROUGH TO  
LAKE SUPERIOR.

EXCURSION TICKETS from Chicago to Ashland and return for \$30 are sold at 63 Clark Street, or the C. M. and St. Paul, Madison Street Depot, Chicago, also at low rates from Milwaukee. Dogs, guns and camp equipment taken free.

The points of attraction to sportsmen on this "Forest and Stream" route are Menasha (Doty Island) for bass fishing; Butternut Creek and Lake for muscalunge; the many branches and lakes of the Flambeau and Chippewa which teem with bass, pike and pickerel, never till this season fished by sportsmen. Between Silver Creek and Ashland are all trout streams, and many others can be easily reached along the shore from Ashland or Bayfield, while rock fishing and trolling in the Bay affords excellent sport.

The new hotel at Ashland, the "Chequamegon" will be opened in July. Meantime there is accommodation at the smaller houses.

Steamers from Ashland to Lake Ports.

**HENRY PRATT,**  
General Ticket Agent,  
175 2m Milwaukee, Wis.

## THE "FISHING LINE."

## Brook Trout, Grayling and Black Bass Fisheries

OF NORTHERN MICHIGAN, VIA  
Grand Rapids and Indiana Railroad.

(Macinaw, Grand Rapids & Cincinnati Short Line.) Sportsmen who have cast a fly or trolled a spoon in the waters of the Grand Traverse Region will come again without solicitation. All other lovers of the fly are invited to try these waters, wherein the fish named above, as also Muscalunge, Pike and Pickerel, abound.

In no other streams east of the Rocky Mountains is the famous American Grayling found in such numbers.

Grayling season opens June 1st.

The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to Point in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, Macinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

Let our aim to make sportsmen feel "at home" on this route. For "Tourists' Guide," containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing Grounds, send to Forest and Stream office, or address—

J. H. PAGE, G. P. & T. A., Grand Rapids, Mich.

A. HOPPE, Eastern Passenger Agent,  
116 Market Street, Philadelphia.

Agencies in the principal cities in the United States.

## Laflin & Rand Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

### Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

### Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6½ lbs. each, and canisters of 1 and 5 lbs. each.

### Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFFG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6½ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less resistance than any other brands made, and are recommended by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."  
BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS. MILITARY POWDER of all kinds on hand and made to order.  
Safety Fuse, Frictional and Platinum Fuses.

Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

## HAZARD POWDER CO. MANUFACTURERS OF GUNPOWDER.

**Hazard's "Electric Powder."**  
Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

**Hazard's "American Sporting."**  
Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

**Hazard's "Duck Shooting."**  
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

**Hazard's "Kentucky Rifle."**  
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12½ and 6½ lbs. and cans of 5 lbs. FFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER. ALSO, SPECIAL GRAIN FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

88 WALL STREET, NEW YORK.

## THE New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD  
For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequalled for rapid firing, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address  
CARL DITTMAR, NEPONSET, MASS.

New York, July 10, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Please say, for the information of some of my friends who may be misled by current statements, that I am still on the same powder for all out-door shooting, which I have used for several years past, never having risked the use of the nitrated powders except when shooting in a confined space in doors, when the smoke from any regular powder would produce a small rather offensive to some people, and cause somewhat greater obstruction to vision.

CAPT. A. H. BOGARDUS,  
Champion Wing Shot of the World,

Gunpowder.

## Warren Powder Mills,

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

**SPORTING BRANDS**—Eureka, Continental, "Border Rifle," Snap-Shot, and Warren Sporting Cannon and Musket, U. S. Standard. The above can be had of the dealers, or at wholesale at the office, 27 Doane street, Boston, Mass., and of the agents, JOHN P. LOVELL & SONS, corner of Washington, Cornhill and Frazier street, Boston, Mass. Jy19

### Fishing Tackle.

## Conroy, Bissett & Malleson

65 Fulton Street, New York.

## Sportsman's Gazetteer

AND

## GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS,  
900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM;" AUTHOR OF THE

"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen. It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the habitat and breeding season of each—a most valuable contribution to science.

It describes 291 varieties of edible fish alone, that may be taken with the hook; 50 varieties of ducks, 50 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been prepared by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapeutics.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illnesses, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sports; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

Boats, Fishing Boats, Ship's Tenders, or Ferry Boats. Or will supply the MACHINERY, complete. Also  
models, drawings and moulds to parties preferring to build their own boats.

**SEND FOR DESCRIPTIVE CIRCULAR.**

## **A VICTORIOUS INVENTION The Eagle Claw.**

An ingenious device for the purpose of catching all kinds of  
Animals, Fish and Game.  
The easy method of setting the Eagle Claw, combined with  
the simplicity of removing the victim, are among its peculiar  
advantages.

It is immaterial how to place it when set. It may be buried  
flat in the ground, suspended from the limb of a tree, or, when  
occasion requires, covered with grass, leaves or other light  
material without in any way impairing its certain operation.

It is adapted for bait of any description, and, when set, no  
Animal, Fish or Bird that touches the bait can possibly escape.  
It does not mangle or injure its victims in the slightest degree,  
nor need they be handled to free them from the trap.

**PRICE LIST:**

- No. 1—For fishing and all kinds of small game and animals,  
sent by mail. . . . . 35 cents.
- No. 2—For catching Mink, Muskrats, Raccoons, large Game,  
Fish, &c. . . . . 75 cents.
- No. 3, or Rocky Mountain Giant, for catching Bears, Wolves,  
Panthers, &c. Can be easily set by a boy, and will stand a  
strain of several hundred pounds. Weight, 10 to 15 lbs. \$10.  
All goods sent, charges paid, to any address on receipt of price.  
Address

**Chas. L. Coate,**

330 Fulton St., Brooklyn, N. Y.  
P. O. Box 214.

Highest Honors

**CENTENNIAL WORLD'S AIR, 1876:  
SHONINGER ORGANS.**

**PRONOUNCED UNANIMOUSLY AS THE  
Best Instruments.**

Their comparative excellence is recognized by the  
Judges in their Report, from which the following  
is an extract:

"The **SHONINGER ORGAN CO.'S** exhibit  
as the best instruments at a price rendering them  
possible to a large class of purchasers, having a com-  
bination of Reeds and Belts, producing novel and  
pleasing effects, containing many desirable improve-  
ments, will stand longer in dry or damp climate, less  
liable to get out of order, all the boards being made  
three-ply, put together so it is impossible for them  
to either shrink, swell or split." THE ONLY  
ORGANS AWARDED THIS RANK.

This Medal and Award was granted after the most  
severe competition of the best makers, before one of  
the most competent juries ever assembled.  
New styles and prices just issued, which are in ac-  
cordance with our rule, the **BEST ORGANS** for  
the least money.

We are prepared to appoint a few new Agents.  
Illustrated Catalogues mailed, postpaid, upon ap-  
plication to

**B. SHONINGER ORGAN CO.,**  
97 to 123 Chestnut Street,  
NEW HAVEN, CONN.

Guns, Rifles, Etc.

**SPORTSMEN**

Will find a select assortment of

Guns, Rifles, Revolvers, Ammunition, And all goods appertaining thereto.

Special Attention is invited to Our New SMITH'S PATENT REVOLVERS,

In four sizes of 22, 32, 38 and 41-100 cal.

This new and elegant Arm combines simplicity durability, a perfect interchange of all its parts. The most critical inspection in process of manufacture, and with its patent improvements, make it the Most Desirable Revolver in the Market.

A COMPLETE ASSORTMENT OF MAYNARD RIFLES SHOT GUNS ETC. Send for Circular.

marked the PREMIER QUALITY

[Extract from FOREST AND STREAM, New York, December 26, 1876, Contributed by one of the Judges of Awards of Guns at the Centennial.]

"This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must rapidly secure the favor of all who test its merits.

**COMPENSATING LUMP.** Strongly recommended. It is invaluable, and should be ordered on every gun. Costs about \$10 extra. Choke-bore, medium or full. Our guns to be had of the principal dealers in the trade only.

**PREMIER GUN WORKS, Birmingham, England.**

**Paper and Metallic Shells**

FOR

**Breech-Loading Shot Guns,**

Manufactured by the

**UNION METALLIC CARTRIDGE CO.,**  
BRIDGEPORT, CONN.

**THE STURTEVANT SHELLS** are the easiest reloaded. Do not have to unsew the head nor use an awl to remove the exploded caps. **THE PATENT MOVABLE ANVILS**, made of steel wire, will not bend or break.

**THE BERDAN PATENT SHELLS**, new model, with Hobbs' patent waterproof primers, never miss fire, and are highly prized by all that have used them.

**PAPER SHELLS.**—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our **BROWN PAPER SHELLS** equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells. Not sold at retail by the manufacturers.

**"St. Louis Conical Base Paper Shell."**

Having made important improvements in our Shell, we can safely recommend them as equal, if not superior, in quality to any Paper Shell manufactured in this country or in Europe.

Among the advantages claimed for these Shells, are: A saving of 25 per cent. in the use of powder; also the great decrease in recoil. The sizes made are No. 10—2½, 2½, and 3 inches; No. 12—2½, 2½, and 2½ inches. Longer

Shells will be made at extra cost. They are not mallable. Sample, 100, sent by express on receipt of \$1.15 for No. 12; \$1.20 for No. 10.

Factory and office, No. 2,239 De Kalb street, St. Louis, Mo.

**St. Louis Patent Shell Manufacturing Company.**

**Capt. Bogardus' Patent Glass Ball Trap and Rough Balls.**

These Traps and Balls patented by Bogardus and used by him many thousands times, proves them to be just what is wanted by all

**SPORTSMEN'S CLUBS AND AMATEURS.**

**THE PATENT ROUGH BALL.**—The only Ball that will break sure when hit by shot. Use none but the best. Every ball marked. Patented April 10, 1877; Traps, March 13, 1877.

### A TROUTING REMINISCENCE.

Selected.

YOU'RE right; I'll go find it at once;  
It needs more repairs, I'll be bound,  
For Jack, the old good-hearted duncie,  
Left hardly a part of it sound.  
Besides, it's the time of the year  
When tackle should all be brought out,  
For April will shortly be here,  
And then for the woods and the trout.

This rod is the one Jack abused,  
And this is the basket and line;  
I wish I had dally refused  
To lend him a fishhook of mine!  
"A nice-looking rig," do you say?  
I think so myself; that split pole  
Cost fifty-five dollars last May—  
Who now would give ten for the whole?

He'd fished some at Long Bridge for smelt,  
Had been to a clam-bake or so,  
And with such experience felt  
He knew all a fisher should know.  
Please hand me that fly-book. Yes, Jack  
Had plenty of pluck from the start;  
And yet, when the party turned back,  
He hadn't commenced in the art.

You ought to have seen his first trout—  
Scarce three inches long, so they said—  
Which taxed all his strength to pull out  
And hang up, right over his head,  
Some twenty feet skyward; the tree  
Avenging his wanton attack  
By keeping, as safe as could be,  
This first trouting trophy for Jack!

Please aid me a moment. A splice  
Is not just the thing in a tip;  
But one can't afford to be nice  
While there's such a soreness of scarp.  
Turn easy at first, till the thread  
Has strengthened the fracture a bit;  
That's splendid—now wind right ahead  
Until we have covered the split.

I think that will do. Jack allowed  
The feat he accomplished was fine,  
And stumped every man in the crowd  
To do such a trick with a line;  
But no one was anxious to try.  
My choice taper line by the feat  
Was ruined forever, well nigh.  
Why, really, this looks rather neat.

I told him such snatching at trout  
Would never do, if he should hook  
A big one—and there is no doubt  
They grew pretty large in this brook.  
But he must be patient, and drown  
His fish ere he brought him to land.  
He said that he "savvied"—the clown—  
And looked very knowing and bland.

I found him soon after, down stream,  
Astride of a log, with his eyes  
On something of int'rest supreme,  
As though they were bent on a prize.  
He said he was "drowning a whale,  
Which ought to be dead as can be—  
He hasn't the game of a snail—  
I think I will hoist him and see."

He "hoisted," and found that his hook  
Was caught in some water-logged chunks  
Of wood, and the fellow's blank look  
Had no more of mirth than a monk's;  
He rallied, however, quite gay,  
Declaring it only one joke  
Of many he'd played me that day,  
And laughed till I thought he would choke.

His luck being "wretched with bait,"  
And thinking to "throw them a fly,"  
He nudged his ponderous pate  
To strike a position whereby  
A cast could be made in a pool  
Which looked very trouty and nice,  
And chose for the venture—the fool—  
A bowlder as smooth as new ice.

He threw, and the bowlder threw Jack  
Right head-over-heels in the hole;  
And O, what an ominous crack!  
Came forth from my elegant pole!  
As mad as I was I contrived  
To ask him as soon as he rose,  
If really he meant, when he dived,  
Another smart "joke" to expose

This joint is the one Jack supplied  
In place of the splintered-up length;  
And though without doubt he has tried,  
It lacks both in lightness and strength.  
But naught he could do would make good  
The loss which my temper sustained  
That day; but to be understood  
That part must be further explained:

He stuck to the fish-rod throughout,  
And when he emerged with a flop,  
Great Isaac! a three-pounder trout  
Was spinning his reel like a top!  
Of course, after fool's luck like that  
He landed the whopper all right,  
Nor cared for the loss of his hat,  
Which floated away out of sight.

And then he just let himself out,  
And bragged to his heart's full content  
Of how he had caught the big trout  
By science! What need of comment?

One thing has been fixed in my mind,  
When I go a-fishing for trout,  
Green fishermen all stay behind,  
Or travel a different route! \* M. A. KINGSFORD.

For Forest and Stream and Rod and Gun.

### Sporting Incidents in Connemara.

WOODCOCK occasionally lie very close; I don't think, however, the following instance of obstinate refusal on the part of a long-bill to fly out and get peppered can easily be matched. Woodcock shooting in close cover is, I think, the cream of shot-gun sporting, requiring the acme of readiness and accuracy on the part of the sportsman, and affording the quarry the utmost possible allowance of law. Very different is the case, however, when the woodcock is started from low brushwood, and obliged to seek refuge by flying off in the open. Like an owl in the daylight, he hardly seems to know where he is going, and falls the easiest of possible victims even to the least practiced gunner.

I was quartered once in the wilds of Connemara during the winter season. Salmon fishing, the king of western sports, did not commence until the spring, and grouse and partridge shooting were over.

There was little to be done but to pot snipe among the bogs, and I generally spent an hour or two at that amusement every day. I did not care about having my dogs come to the conclusion that a jack snipe was of more importance than a pack of grouse or a covey of partridges, and for that reason used generally to leave them at home.

Sometimes I took a "gossoon" with me to carry the birds—often being, at that time, of a musing and solitude-loving temperament, I used to go entirely unattended. On one of these occasions, after slaughtering as many snipe as I chose to carry in my bag, I remembered that I had heard Tim Lyden—my head boatman and sporting factotum in chief—assert that morning that, while out the night before trapping badgers, he had seen the woodcock landing from the sea on the side of Carrowbeg Hill.

I was, of course, aware that the woodcock did thus land in the night-time on the hillside, and afterward scatter themselves through the more thickly wooded inland country, but I did not think that, even on a moonlight night, the sharpest watcher would be likely to see them in the act.

Partly to test the truth of Lyden's story, partly because I had nothing better to do, I climbed up the sides of Carrowbeg and began beating the low and widely separated bushes which flecked the hillside about the place where the cock were said to have alighted. Sure enough, from the very first I kicked, out flew a woodcock. He took me by surprise, and had sailed down the hillside, out of reach of the light shot I had in my gun, before I could draw a bead on him. I distinctly saw him, however, alight in a small isolated bit of bush, and I determined to go and tumble him over, chiefly to see what condition he was in after his flight from the Norway coast. Down I went, keeping my eye on the bit of bush, and soon got close up to it. I gave a sharp "hist" to start the bird, followed by a "hi! cock! cock!" and other ejaculations intended to have a startling effect. All in vain. At last I went right up to the bush, and began kicking at it and walking around it.

It was little more than eight or nine feet across in any direction, and did not rise anywhere to a height of four feet. All the noise I could make with my voice, seconded by the crashing of heavy shooting boots against the lower branches, failed to have any effect, and, after trying to peer into the dark recesses of the brush-wood, I came to the conclusion that, in spite of the evidence of my eyesight, Mr. Woodcock must have flown away and taken refuge elsewhere. I threw myself down to rest after my climb and to munch some devilled biscuits I had with me. Having washed said biscuits down with a mouthful of sherry from a pocket flask, I was about to enjoy what they call in the West "a shaugh of the pipe," when—the instant I struck the Vesuvian—out bounced my friend, the woodcock, almost from under my nose, taking care this time to fly to a safe distance before he again secreted himself. Whether it was that the explosion of the match was too much for his nerves, or that he had observed that, with commendable caution, I had removed the cartridges from my gun before laying it down, I cannot say; at all events, he "went" quite easily, after having, a few minutes before, resisted every effort I could think of to make him start. What his feelings were while I was dancing like a red Indian around his hiding place on one foot and kicking at him with the other, remains locked in his own bosom; I only know that a more obstinate refusal "to get up and git" I never encountered.

Tim Lyden, whose name I have already mentioned, was one of the most useful retainers that a sporting man could possibly wish for. He knew almost everything connected with the habits of the various descriptions of game, and of vermin, too, with which "the houseless wilds of Connemara" abounded. He also had much deep lore and practical skill in the "gentle art," and was as untiring and faithful as a dog. He was always ready on emergencies, and had various little useful accomplishments, which were always coming in opportunely. For instance, when I wished to start in my canoe—a somewhat rickety conveyance, without a keel, made of tared canvas stretched over a light wooden framework in the regular Arran Island fashion—I would take off my watch and leave it behind, as I had nothing to do but start Tim with the correct hour, after which he could carry in his head the lapse of time, and tell me at any moment during the day what the time was with unfailing accuracy.

Once he and I started alone with a small canoe to investigate a part of the coast which even Tim himself had never visited. We had had the canoe transported about forty miles overland on a country cart, and were entering on a region where even the scattered huts of the hardy fishermen or kelp burners were not to be seen. The wild and desolate beauty of these bays will forever haunt me. Whether dancing in glittering wavelets under a bright morning sun, or glowing in sheeny silver on a calm afternoon; or, better still, while weird and shadow-flecked beneath a stormy moon—they were always lovely, always new. On the occasion I speak of, we had rowed to the head of a small inlet, and taking the light canoe on our shoulders, had made a portage of a few yards over a narrow neck of land into another sheet of water beyond. No sooner had we got ready to start rowing afresh than Tim—whose powers of vision were absolutely marvelous—caught sight of a seal sunning himself on a distant rock.

A council of war to decide on the best plan of approach was instantly held, and we determined to paddle the canoe cautiously round the bay, which was apparently entirely landlocked, keeping as close under the lee of the shore as possible. We knew, of course, that there must be an opening somewhere among the rocks into the open sea beyond, though, as is often the case, we could see no sign of one from the position we were in. We were destined to know more about that point, however, ere long. On we went, and after pulling slowly and cautiously for some time, we observed that the tide, which was falling, ran quite strongly enough to take us in the direction we wanted to go without help from the oars.

Presently I myself began to imagine I could distinguish something like the shape of an animal on the rock where Tim, who could see it quite plainly, had pointed out the seal. Soon after the creature moved its head slowly from side to side, and I began to make out its contour distinctly, and keeping my eye steadily fixed on him, got my rifle in readiness. At the rate we were going, a very few minutes more would bring us within range.

I had determined to risk a long shot, for the seal is a very shy and wary beast when out of the water. In the water he is comparatively tame; I have known them rise quite close to a boat and follow it for miles. In deep water, however, it is useless barbarity to shoot at them, for you never can recover the carcass, unless, indeed, you chance to hear of its being washed ashore days afterward. If you can kill him dead, however, when he is well up on a rock, of course you get him; but you must not leave a kick in him, or he'll use it to slide down into his favorite element.

All was breathless attention. If Tim had been dead he could not have made less noise, and I could hear my heart beating against the side of the boat as I lay in the bow. I had made up my mind to fire as soon as we reached a certain point, and the critical moment was fast approaching, when Tim suddenly broke the silence with a loud cry, "Oh be Cypres" (his favorite oath), "look out, Captain!" Down plunged the seal into the water, and I turned on Tim with a look of speechless indignation. In answer to my look, Tim ejaculated, "Och, damn the seal; get out the other paddles for the love of God!" I turned round, and to my amazement, saw that the only outlet to the bay consisted of a passage about seven feet wide.

The tide outside, which had been falling for some hours, was already fully four feet lower than the water in the bay we were in, and the latter was pouring out through the orifice in a gentle but powerful cascade. We sprang to the paddles, and commenced pulling our level best, but all in vain, we had approached too near the hidden opening, and in another moment we took the nearest possible somersault over the falls. The boat shot down stern foremost and turned clean over into the water beyond. Fortunately we could both swim like fishes, and rising at once to the surface we collared the boat and got it upon the rocks.

We managed also to capture the floating paddles, but an excellent rifle, and a favorite breech-loader that fitted me like a glove, remain—I suppose to this day—at the bottom of that confounded little miniature cataract. Slowly and sadly we paddled back to the small shanty where we were to encamp for the night, and it took several hours of the pure "dew of the mountain" to enable me to think with any sort of equanimity over my first attempt at seal shooting in Connemara.

N. O. E.

For Forest and Stream and Rod and Gun.

## A WILD GOOSE CHASE AND A PRAIRIE FIRE.

MY venerable friend, Mr. "C.," a veritable Nimrod from the city of —, in N. H., who has been sojourning among us since last fall—good-natured, kind and persevering—has but one fault, to wit: he believes and maintains that he is the fortunate possessor of the best breech-loading shot-gun that was ever made. It is a Clabrough Bros. No. 10, and if it wasn't a "leetle" too heavy for him, he wouldn't part with it this side of the happy hunting grounds. With regard to the wild goose chase I am to speak of, we—my friend of the "Clabrough," myself and son—started at 3 A. M. by the watch, and very soon were safely aboard of our trim little boat on the bosom of the gentle Minnesota. It was an April morning. Although early in the season for this northern country, the weather was delightful, with a starlit sky overhead and a bracing morning air all around us. We soon passed the ferry, the Indian camps, snugly situated on both sides of the river (these Indians are old residents among us and have never taken up arms against their pale-faced brethren), and rounded the big bend near Major Murphy's, going at the rate of eight or ten knots an hour, with a strong current and the aid of a good pair of oars, old Mr. C. occupying the stern. In due time we safely moored our craft on the left bank of the stream, and cautiously crept up the bank and began to reconnoitre in the gray light of the early morn. Mr. C., who was the generalissimo of this campaign, had the plan all laid out, where each of us were to be posted along the banks of a long lake, the nightly resort of the *Anas canadensis*—our game. He knew from previous experience where the geese were sure to fly out a little before sunrise—they always flew out this way—and in whispering accents we two received our general instructions, and silently proceeded to take up the positions assigned us, well covered with reeds and bushes. Success was sure, as, unlike "C. C.'s" bear story in your paper, the geese were there, and we couldn't have missed them. Occasionally a flock of mallards or woodducks would come skimming in from the uplands, offering very good shots, but we were after geese, and did not want to speak to them just now. Presently the geese on the lake began to get up a lively discussion as the first red streak was tinging the eastern horizon, heralding the coming of "Old Sol" in all his majesty and pomp; and hark! up they go, about fifty of them! Closely we hugged the ground, but to our great surprise they must have been mistaken in their bearings, or else a sly old gander that we had heard discussing out on the lake had received a friendly warning from some of the ducks flying into the lake close over us. Ducks, like women, can't keep a secret any how. The geese hugged the lake close, and finally crossed over to their feeding grounds, where they were well out of our reach. Not a word was said, not a whisper was heard; there were more geese in the lake talking rapidly and loud, some of them surely must come our way; they always flew that way. Hark! up goes another flock, quite as large as the first, and they are nearing, but—well, I didn't swear—I never swear—but confound that tell-tale drake that betrayed us; they flew in the same track that the first flock did. That decided me. A heavy fog had risen, and under its cover I hastened to the place where I had seen the two first flocks cross the river. Come on now, I've got ye at last. Pest! up goes a tremendous big flock, seemingly the remainder of the army. Having sent their skirmishers ahead they will surely follow in the same track, for as yet not a gun had been discharged. With bated breath I watched them rise over the low fog bank; higher and higher they rose in their spiral flight, and when they were about as high as the surrounding hills they sped up the lake and crossed over at the Murphy place a full mile above where we were sure they always flew! Well, when the geese were gone we three met. Says our commander, "Never mind, we'll get those geese yet when they come in again at about 8:30 A. M. They always come in on the same track that they fly out." That was cheering news; so we made a fire, warmed our coffee and partook of breakfast. After breakfast we lighted our pipe and contentedly listened to the "bulldoo-oo" of the innumerable prairie roosters and hens, and the drumming of the pheasants close by. One of the latter in particular seemed to be very close to us, and we could almost feel distinctly every rap he gave that old log with his outstretched wings. Poor fellow, it proved to be his last en-

joyment. After an hour or so Mr. "C." remarked that we had better take up our position, as the geese would soon come in again. The early morning train came thundering up the valley within a quarter of a mile of us, and for the time being all creation seemed hushed in silence witnessing with awe the performance of that monster of human ingenuity—the iron horse! Leisurely we proceeded to the places assigned us by our commander-in-chief, in the full consciousness that now we had them. Having waited probably thirty minutes, our expectant ears were greeted with that familiar sound proceeding from the game we were then lying in wait for. Nearer and nearer came that sound. Keep well covered. But lo! what's the use to describe our feelings when we looked from behind our blinds. The geese were already over the lake spreading their wings preparatory for a downward flight. "They did come in by the same road they flew out," but not exactly where we knew they always would come in! Well, we didn't want any geese very badly anyhow—it was Friday too—and so we gave it up. After a while my son began to strike out for himself in the hope of talking a word or two with some ducks. Accidentally passing by the log where our pheasant had been drumming lustily only an hour ago, when up springs a large hawk, holding securely in his talons the ill-fated pheasant. The boy wasn't slow in raising his old No. 10, and in an instant down came hawk and pheasant. On an examination, however, he found that the robber had already killed his quarry and had been tearing into the nice plump breast of our little friend. The poacher, for such he was according to the laws of our State which forbids the taking, etc., of any quail, pheasant, etc., in this and some other months, was not much hurt, so we secured him in spite of his very loud protestations, and tied him to a sappling till our return home, in order to deliver him up to the proper authorities. After a while we tried to get at the geese by strategy, but they seemed to see through all our manoeuvres, and finally we resolved that we should not be bothered with them any more.

But hark! what makes that fearful sound in the distance like an approaching thunderstorm! It must be the express train due in Shakopee at 9:30. No, that had passed! See the fearful clouds of smoke rising up before us with a dreadful crackling noise. It is a fire in the big rushes on the low prairie extending on both banks of the river and the adjacent lakes. "Are we in danger?" asked Mr. "C." "Guess not; it seems to be across the river." Louder and nearer comes the sound; blacker and blacker rolls the smoke; the wind too increases, large cinders are falling thick around us. "Why, look! it is on this side of the river already!" exclaimed Mr. "C." and off he puts for the boat. "Where is my boy, he has the key to the boat in his pocket?" Why not set fire to the rank grass and weeds where we are? We dare not, for it would be between us and the boy! Call him in! We shouted and whistled. No answer. Again we uttered a prolonged whistle. At last we see him coming toward us. No time to lose, the smoke becomes stifling. Away we hastened to the boat in the nick of time, and by strong rowing against the heavy current we succeeded in escaping, and landed at a safe distance, where we rested for a good long while, and finally put out for home, tired, hungry and disgusted at the idea that any one person could tell with any degree of certainty anything about the flight of those geese! Mr. "C. O.," of Rock Camp fame, had at least a deer or two to console him, but we didn't get a feather. In my next I will give you a description of our famous duck passes. Ducks are here in great numbers. Shakopee, Minn., April 18, 1877. R. T. S.

## THE OLD HUNTER'S STORY.

ONLY a kick from a broncho boss, and a man with a ugly leg, but it seems mitey strange to me to be lyin still on my blankets with the bite sun shining down on the pines an lakin to see the old hunter aber in the varm lile ov day. The rocks roll on the mountain whar the deer an bigorn walk free in thur trails; quail an gray squirrel ur callin an chatterin roin the spring, not querlin ur scoldin, but almost lile talkin for pure pleasure ov free air an good water. Wild pigeon lile thick in the dead pine at the foot ov the clemga, but they fear the black eagle perched on a pint in the cliff crosst the canyon more than any rife. Three days will seem longer than usual now that your gone to the towns fur flour and duxins, but I'd orter be patient, yes an happy, fer things mite be worse mitey easy. I've plenty to eat an good weather, an Tom piled me wood enough handy to last fur a week if need be. A hurt heals quick fur a man that healthy. Why, the thing mite hev happened in sun, durm city stead ov in the free mountains. Lord! how pleasant the day is. Come closer, Boze, ole dog, I want to put you. I guess I'll take my stub ov lead pen an tell my fur ol friends in a city somethins bout these mountains. Talkin ur a heap easier nor writin, but thars no one to talk to cept Boze, an he's sleepy. I hope you'll excuse this kind ov paper, we use it mostly fur cigarritos.

Near to sundown one day I was crosstin the Santa Rosa mountain, an whar the trail turns down toward the river, in a thick patch ov manzanita, which wood ar sum harder nor iron, I foun thar hed bin queer doin's; brush broken an trampled, that two bulls fiteit kud hardly hev managed; I war lile loded, had little but my rife an blankets. Arter examinashun I see thar bar don it, an big ones. Pokin roin I kum to a break in the bresh leading down to a canyon; thar war cold blood on the rocks an haron the broke ends ov the breshes. Lookin off down the hill somethin bleedin hed bin drug, makin a plain trail, which I follered, findin, well-covered with dead bresh an pieces ov rat's nest, a middin-sized cub, partly eaten. I knood a lion hid it; but Lord! who ever heered ov a lion killin even a cub grizzly, sides whar war the she one bout that time; goin back I foun whar the lion cum into the broke place, his tracks was on top ov the tore up ground and led to the spot whar I seed from the sign the cub hed fur some time bin lyin; ov course whar he drug off the body it wiped out his tracks, being sorter behind him. I continued the sarch; my hart jump plum to my mouth ez I picked up a man's hat, an see hangin to the bush the hat lay under most all ov a coat-sleeve, an along in the broke place leadin down toward the canyon him every bush hed a rag on it. At the end of this break, bresh was broke in every direckshun, and fresh dried blood was quite plentiful. I foun two places whar thar hed bin pools like, an fer the first time I noticed dog ez well as bar tracks. In one bar trail I foun only three foot tracks an considerable part dried blood and paunch stuff, which showed me one of them ar bars was bad hurt. Just then I noticed a slight trail leadin off down the hillside kinder sideways, an with little lookin, cum to the conclusion that a man badly hurt by bars, but not follered, hed crawled off thataways. Hurryin back up the hill fer my blankets I foun a rife lyin bout ten feet from the tracks, not loded, an with the hammer broke off. Leavin it thar I tuck the trail an follered as fast ez I could

through thick bresh an over rough ledges ov rocks, an I felt mitey bad thinkin how the poor feller must a suffered in travelin. At the foot ov the slope was a narrier canyon and small stream ov water; here I seed whar he drank, leavin the print ov one han an one knee in the edge ova dam made by the fallen down trunk ov a alder, and kep on down the canyon whar the travelin got smooth. Hog an bar tracks was thick in the canyon, an it made me feel kinder quarmish to think how quick hogs would eat a dead body. Night come on pritty black, but I knood that noways he couldn't git out the canyon, an kep on, hollerin quite frequent for fear I mite pass him an him alive yit. Mebbe a mile, to me it seemed longer, from whar I first come into it, the canyon turned short to the east an widened. Under a oak near the water was a cabin, it was so still an black lookin it made me think ov a coffin. I hollered, to which no one giv anser. Twur most infernal quiet. I creeped in at the door-place an listened, but didn't hear nuthin cept my own hart beatins. Three matches broke short off before I cud git one lited. Then, ole boze, you crawled whinin out ov a corner, and, lookin, I seed that the cabin war in fact a coffin.

Poor young feller! I donno ez I kud a helped him even ef I hed bin a heap sooner. Thar nite I camped out in the open air an kep up a good fire. Thar you was only a puppy an hungry, ole Boze, you stuck close to whar hed bin your masteer, spite ov all my enticin; an we both know the reason why no hogs hadn't got into the shanty. When the sun clumb over the mountain I went into the cabin a minit. He'd had a fire, a coffee pot wuz upst on the ashes, an half melted. Thar want no wooden thing left in the cabin he cud git at. On a rafter whar a poke holdin sum biled shote an corn bread; neither uv you cud reach it. He had evident tried to wrap some rags round his hurt shoulder; but, good Lord! how cud he do it? The right arm and shoulder war chawed into pieces—bone mixed in with flesh every whichaways—an the right leg bit most off high the hip jint; the face wasn't hurt. When the bar grabbed him I spose that he throwed up his arm to perfect it. Skeerely more nor a boy, poor fellow! He must a bin handsome; his long, yellar hair war soft like a baby's, an his han no bigger nor a woman's. Thar war marks in the dirt on the floor that war some kind ov writin, but nobody cud read it for dog tracks. Thar war marks, tho, I cud read most too easy—whar he'd dragged himself to the fire, an under the rafter whar the food war, an once whar hed bin to the water. Soon after—leavin the puppy, which hed got tolerably friendly, all the grub cept a little *pinole*—I struck out for Bill Foster's on the river. Bill seed as how the young feller war a stranger he'd hired bout three weeks before to look arter hogs in that canyon, which war troubled with grizzlies; thet he'd giv him a rife an the best dog he had to help him; that he'd cum thar afoot from the *Embarcadero*, whar he'd run away from a schooner; that he war so young an white handed that he kinder mistrusted to hire him, but the ole woman, who war mighty soft hearted, sed he'd starve sure if they didn't; that his name was Charley, and once sence he'd bin herdin he cum over to ax fer some writin tools and paper (which they hedn't) to write to his mother; that he seemed dreddful dispaired an down-hearted, an Miss Foster giv him the pup I'd seen to kinder console him. The nex day me an Bill went up thar an berried him, wrapped round in a par ov Bill's blankets an a white sheet Miss Foster sent by us. I don't know much about prayin, but when all was finished we tuk off our hats and Bill sed, "The young feller war chock full ov good grit an ov luv fer his mother." EL CAZADOR.

WILD TURKEYS.—In the expressive language of the Indians the month of September is known as the moon of turkeys. Early in September the males collect together by themselves, and the hens and young ones in another flock, and continue so for some time; all the while, however, moving about in search of food. In their travels they often reach the banks of considerable rivers, where they all join in company. Crossing a river is to them an undertaking of serious magnitude. They first betake themselves to the nearest eminence, and there often remain a whole day, or sometimes two, as if for consultation. During this time the males are heard "gobbling," calling, and making much ado, and are seen strutting about as if to raise their courage to a pitch befitting the emergency—a line of conduct imitated by the females and young. At length, when the weather appears to be settled, and all around is quiet, the whole party mounts to the tops of the highest trees, whence, at a signal, consisting of a single cluck, given by a leader, the flock takes flight for the opposite shore. The old and fat birds easily get over, even should the river be a mile in breadth; but the younger and less robust frequently fall into the water—not to be drowned, however, as might be imagined. They, bring their wings close to their body, spread out their tail as a support, stretch forward their neck, and, striking out their legs with great vigor, proceed rapidly toward the shore; on approaching which, should they find it too steep for landing, they cease their exertions for a few moments, float down the stream until they come to an accessible part, and by a violent effort generally extricate themselves from the water. The tame turkey is a direct descendant from the wild, and there is little difference in the quality of the flesh.—*Montreal Star*.

THE PLACE WHERE THE SUN JUMPS A DAY.—Chatham Island, lying off the coast of New Zealand, in the South Pacific Ocean, is peculiarly situated, as it is one of the few inhabitable points of the globe where the day of the week changes. It is just on the line of demarkation between dates. Thar high twelve on Sunday, or Sunday noon, ceases, and instantly Monday meridian begins. Sunday comes into a man's house on the east side, and becomes Monday by the time it passes out of the western door. A man sits down to his noon-day dinner on Sunday and it is Monday noon before he finishes it. Thar Saturday is Sunday and Sunday is Monday, and Monday becomes suddenly transferred into Tuesday.

KILLED BY A PANTHER.—Wednesday, Aug. 1, a young lady, aged about sixteen, daughter of Mr. Luce, who lives about nine miles west of Paris, Michigan, was one of a party out picking whortleberries on the plains in the township of Barton. During the day she became separated from the rest of the party, and was supposed by her associates to have gone home, but on going to the house later in the day they learned that she was still absent. Returning to the point where she was last seen, strict search was commenced, which was soon rewarded by the discovery of her remains, about forty rods distant. Her body was about half devoured, which is supposed from the tracks in the neighborhood to have been the work of a panther.

## Fish Culture.

## FISH IN THE CHEMUNG.

Seth Green, Esq.:

DEAR SIR—I know you will be kind enough to give us your opinion as to the next best stock to transfer to our stream—that is, the Chemung River. About five years ago this stream was stocked with black bass, and the fishing is simply immense. In a space of twelve miles on the Chemung the fishermen catch with hook and line not less than three hundred bass daily which average as many pounds in weight. They run from a half pound to two and a half pounds. They are fished for with dobsons and crabs, and no other fish in the stream seems to be caught. If we could stock the stream with some other good fish, thereby compelling the fishermen to change their bait, we might be successful in protecting the bass. Our stream is alive with those fish, and there is nothing else fished for. To describe that stream, you may judge for yourself what is best to transfer. It is rocky gravel bottom, with numerous rapids, and in all quite a rapid stream, with very few dams, which are always accessible in high water. Is there any species of salmon that would do well? Several gentlemen who take great interest in the protection of those fish wished me to write you and get your advice. Hoping you will be kind enough to return answer soon, that we may decide what to do, we remain respectfully yours,

Max Haight, Henry Jones, Oscar Bendy, James Sergford,  
Jerome S. Hill, and many others.  
Elmira, N. Y., July 17, 1877.

## THE REPLY.

GENTLEMEN—There is no other kind of fish that would be suitable for your river; any other kinds would do more hurt than good, for they would eat the young bass.

The bass do not need any other protection, except to not take them or allow them to be taken in any other manner than with rod and line, and not take them during spawning season. They spawn in this part of the State between June 15th and July 15th. Protect them during the above time and you will have plenty of bass as long as you proceed in this way.

If you allow eel weirs and nets to be used you will not have any bass; and if any parties use eel weirs or nets stop them before they take all the bass—in other words, “lock your stable door before the horse is stolen.” I am very much pleased to hear of the great success in stocking your river. You are one of the many that I get favorable reports from.

Yours,  
Rochester, July 31, 1877.

SETH GREEN.

FISH IN PELHAM BROOK.—In June, 1873, I placed a few hundred young salmon in the Bronx River, below White Plains, and as many more in Hutchinson's, or Pelham Brook, which flows into Long Island Sound at Pelham Bridge, Westchester County. I deposited the little fellows, in each case, in hut e shallow spring runlets, whence in 1874, with hook and line, I took several, averaging the length of your hand. In 1875, and since, I could find none, hence I conclude that they all went to sea in the fall of 1874 and spring of 1875. Will you kindly request any of your readers who may live near Pelham Brook or West Farms estuaries to communicate to you any news of the return of these *Salmo salar* in the shape of grise? They should be heard from soon. MANHATTAN.  
New York, Aug. 7.

FISH CULTURE IN VIRGINIA.—A correspondent in Rockbridge County, Virginia, writes:

“The good results of the work of State Fish Commissions are now being shown. Large numbers of bass are now being taken in the Upper James and in the Jackson River, in the vicinity of Clifton Forge, Va. The Board of Supervisors of our county have taken steps to carry the law into effect in regard to the placing of fish ladders on all fish streams in the county. T. K. G.”

TRANSPORTING FRY.—As there is a vast difference of opinion in regard to the capacity necessary for the transportation of one million young whitefish, I having had the experience during the past season of transporting to three different localities the number above mentioned, and that by steamboat on Lake Michigan, which afforded the most favorable circumstances, I found it necessary to use fifteen fifty-quart cans and nine barrels, to enable us to transport them, with the lake water at our command, and that it would require at least one-third more room to carry the same amount any great distance by rail.

H. W. WEBSTER,  
Supt. Wis. Fishery Commission.

Rochester, N. Y., July 31.

NEW HAMPSHIRE.—100,000 shad have been placed in the Merrimack River, where the Contoocookville River unites with it. This is the second hundred thousand this season.

—The shipment of whitefish and trout eggs, elk, deer, grouse, etc., from the United States to New Zealand is one of the interesting phases of the acclimatizing work as now carried on between different countries.

—One hundred thousand shad from the South Hadley Falls, Mass., hatching establishment, have recently been placed in the Mississippi River at St. Paul.

—The Green River, at Mumfordsville, Ky., has been stocked with 100,000 young white shad.

—The Fish epidemic has broken out at Silver Lake, N. Y., and great numbers of fish are dying.

## Natural History.

## HYBRIDS.

We take pleasure in printing the following discussion of the “hybrids,” recently referred to in this journal. Prof. Gill is certainly qualified to speak with authority in this matter, and we presume that his dictum will be accepted as final. Such a hybrid as claimed would be a physiological impossibility:

SMITHSONIAN INSTITUTE,  
WASHINGTON, July 14, 1877.

EDITOR FOREST AND STREAM:

Apropos of the alleged hybrid between a cat and a raccoon noticed in your issues of June 21 and July 12, I would inform you that a similar “production” was heralded in “The American Naturalist” for October, 1871, by no less a man than Col. T. W. Higginson. As paragraphs respecting wonderful hybrids had been going the rounds of the papers at that period for some time, I considered it a kind of duty to enter a protest against belief in such monstrosities, and took the occasion of the publication by such a responsible man in a periodical of such established scientific nature as the “Naturalist” to do so. As a like reason now exists, I send herewith the article there published, which equally applies to the case in question, which you are at liberty to republish if you think proper. It need only be premised that the animal examined by Col. Higginson was seen at Taunton, Mass., and was said to have been born in China, Maine:

Editors of the Naturalist.—I find in the number of the “Naturalist” for Oct. 1871, vol. 6, p. 600 which has just come to hand a notice by Col. Higginson, endorsed by Prof. Jenks, of an alleged hybrid between a raccoon and cat, which is extremely tantalizing. No information as to the structural characteristics of the animal is given, and scarcely any as to other points, and yet it is not too much to say that the authentication of such hybridity would revolutionize physiology, for certainly nothing like it has hitherto been made known. Remarkable as was the alleged hybridity between the ram and doe roebuck (*Capreolus europæus*) recorded by Hellenius, it pales into insignificance when compared with hybridity between the cat and raccoon. We have, in the last mentioned animals, not only representatives of distinct genera and families, but of primary groups (Superfamilies) of the fissipede carnivores, characterized by differences of as great morphological value, as, for example, those between the horse and rhinoceros: those differences, in the animals in question, are exhibited especially in the osseous, digestive, and generative systems, and it is therefore desirable to know in what manner these systems are modified in the supposed hybrid; the living animal could readily be examined as to its dentition (the number of the molar teeth and their characteristics), the feet (whether digitigrade or plantigrade and whether tetradactyle or pentadactyle), the head (whether abbreviated and cat-like, reflecting the diminished number of teeth, or whether prolonged into an attenuated muzzle), and especially the character of the snout, whiskers, the claws, the tail and the pelage. The very vague information that has been furnished respecting the form, walk, tail and pelage is very insufficient, and conveys no clear idea as to the animal's peculiarities. No clear idea, either, is obtained by the mere reader from the statement that “the animal when taken up by the tail, turned upon the aggressor with a fury far beyond that of a common cat.” Although my experience with cats under such conditions has been limited, I cannot conceive how more fury can be manifested than I have seen exhibited by one cat when subjected to such an interesting experiment. A clue is indeed furnished by the opening paragraph of Col. Higginson's remarks, namely, that the animal “struck [him] at first as being the handsomest cat [he] had ever beheld,” and after this significant admission, it is more than probable that its characters would only require to be contrasted with those of an ordinary cat. It may be added that the wild cat (*Lynx rufus*) has “pointed and tufted ears” (which the raccoon has not) and hybridity between a domestic cat and lynx would not be improbable.\* My acquaintance with you, Messrs. Editors, assures me that you must have entertained considerable doubt respecting the reliability of such an account, although you have made no comments, and you would confer a boon on science if you would procure a photograph—not a drawing which might reflect, unintentionally, the imagination of the artist—of the animal in question. Until better evidence than has yet been brought forward is offered, naturalists will not only be excused for doubting any such hybridity, but would be inexcusable for not doubting it, and you, gentlemen, will, I doubt not, concur in this sentiment. I scarcely need remind you of the physical difficulty a male raccoon and a female cat would encounter in the prosecution of their amours, and that therefore if such a monstrous union were possible, the marriage must be between a cat and female raccoon. But until most cogent evidence is adduced, I must remain sceptical as to the possibility of any fruitful union whatever.

Of course, no reflection is cast upon the eminent gentlemen who published the account of the remarkable animal, and who have only repeated what they heard; they, probably not being very familiar with the order of mammals in question, naturally believed in and reflected the opinions of others. My only object in this communication is to elicit more evidence while it may readily be obtained, and I may be allowed to express the hope that when the animal—happily for the interest of science!—dies, it may be reserved for a more worthy fate than to leave its skin stuffed for a museum: it should, of course, be submitted to the examination of a critical anatomist.

In conclusion, a few words respecting the nature of the evidence required in alleged cases of hybridity may be serviceable. In view of the constant statements respecting hybrids circulated in various publications, affirmations and beliefs are not sufficient. Hybrids partake of characters peculiar to each parent, but modified by the sex of each parent. Therefore all the men of China might swear they saw a cat and raccoon in *cotus* (and in view of the strength of the sexual instinct, the allegation might not be wholly incredible), and all the men of Taunton might swear that they believed that the offspring of one of the animals was the result of such amours (and in view of the credulity of man

\* It is, of course, not suggested that the animal in question is necessarily a hybrid at all, much less between the cat and lynx; the character of the tail alone rendering such origin highly improbable; it is merely intended to indicate within what limits hybridity might be credible.

and the general ignorance respecting nature, the reality of such belief would be quite credible!) but all such affirmations and beliefs would not meet the requisites of the case, unless the offspring shared characteristics of each parent, and even if it were further sworn that the female had been precluded from intercourse with another animal, it would be no further evidence, for unless the allegation should be confirmed by the characteristics of the animal, we would still have truthful and infallible nature against at least fallible man.—THEODORE GILL.

The editor of the *Naturalist* prefaced this communication with the following remarks:

“HYBRIDS.—Simply remarking that we strongly suspected that the supposed hybrid between the cat and raccoon was nothing more than a cross between an Angola and a common gray cat, a variety that is well known in this vicinity (Salem, Mass.), and in every way corresponding to the description given, and we thought it best to let the communication printed in the October number call forth comments on this oft recurring question of hybrids; we accordingly give the following careful summary of the subject with thanks to Dr. Gill for treating it in so concise a manner.—ENS.”

On subsequent inquiry I ascertained, as I had suspected, that the animal was nothing but a fine Angola cat, and it was said the offspring of an individual brought from “Africa” by the captain of a trading vessel.

Of course I cannot admit the possibility of the animal alluded to by G. C. S. being a hybrid, or having any intermediate characters between the cat and raccoon.

THEO. GILL.

VENUS' SLIPPERS.—Mr. F. Buckland, in *Land and Water*, says: “These slippers are far more beautiful than anything ever yet turned out in the workshop of a London or Parisian ladies' bootmaker. They are found floating far out at sea in the Mediterranean, on the French coast. Each slipper is about an inch and a half in length, and half an inch in the widest part. They are of a lovely glass-like consistency, and in certain light resplendent like jelly fish. They are the shape of a handsome shoe; the edge of the shoe projects in a very ornamental dentated margin, and the toe part is highly ornamental, as if with embroidery insertion. Mr. M. Latbarn says: ‘It is a kind of jelly fish; I have had considerable difficulty in finding out its real nature. At last I ascertained that it is one of the pteropoda, or wing-footed molluscs.’ The Rev. J. Wood writes: ‘These are so called from the fin-like lobes that project from the sides, and are evidently analogous to the similar organs in some of the sea snails. These appendages are used almost like wings, the creature flapping its way vigorously through the water, just as a butterfly urges its devious course through the air. They are found in the hotter seas, swimming boldly in vast multitudes amid the wide waters, and one species has long been celebrated as furnishing the huge Greenland whale with the greater part of its subsistence. The scientific name of it is *Cymbulia*, so called on account of its being so like a boat.’

“These slippers of the Marine Venus are so beautiful in form and structure that I propose, if possible, to have a model of them cut in crystal. In the form of ear rings they would make very pretty ornaments, as showing the *chaussure* of Cinderella of the Ocean.”

## SHARKS.

In the absence of any work treating on *Squalada*, or sharks, to instruct me, what I have to say in relation to these sea monsters must be mainly based upon personal experience and observation. The principal varieties met with on our coasts are the blue, mackerel, switch-tail, shovel-nose, hammer-head sharks, the little dog fish or dog shark, and occasionally—no mean member of the family—the white shark. These distinguishing names are mostly derived from some peculiarity of form or color of the fish. All the species have a rough skin resembling sand paper to the touch, and the top fluke of the tail is longer than the under, which feature is so wonderfully marked in the switch-tail that this organ is often as long as the remainder of the fish, and at once stamps him among his species. Their mouths, circular or convex in form, open so far under and behind the end of the nose, that they cannot seize things above them without turning upon their back; and their jaws are armed with numerous rows of sharp lancetate teeth, except in the cases of the mackerel and dog sharks. The mackerel shark has round teeth, notwithstanding they often attain to large size, and the mouth of the little dog shark is encircled by a corrugated bony rim which serves them as teeth, and which enables them to prey upon molluscs, which the sharp tooth fellows cannot do. The largest shark I ever knew taken was of the blue variety, and was caught by a Mr. James Northrup. This fish was entangled in a gill net set off the beach for bass. Some time during the night the shark had struck the net, completely wound himself up in it, and came on shore, notwithstanding the two hundred pounds of stone to which the net was anchored, and was found by the owner of the net the next morning. This fish would weigh about one ton and was nineteen feet ten inches in length.

The ovum of the shark is white, about the size of a walnut, and perfectly round. In the absence of positive knowledge, I should say sharks are viviparous, since I have removed eggs from these fish which contained perfect living fry that could swim away. It is possible, however, that they may hatch soon after removal from the parent fish. I do not remember ever counting the ova of a single shark, but should say the number would range from sixteen to two hundred, the number being dependent upon the size of the fish. Sharks swimming at the surface of the water are distinguished from other large fish by exhibiting the dorsal fin, and the top fluke of the tail; while others rarely show other than the fin. All the shark family are migratory, and leave our coast during winter—the switch tail delays his stay longest in the fall, and the dogfish appears earliest in spring. These fish have a reputation for eating people, which I am persuaded they do not deserve. If they were the one-hundredth part as voracious for human flesh as one would be led to suppose

from reading of them, one thousand people would lose their lives at our watering places along our coast each season, since our shores swarm with these monsters every summer; and if one of them attempted to catch a man in the water and he were a hundred feet from him, the man could not turn around before the shark would devour him, for when fully under way for an object, a shark excels in speed. He catches the dolphin in a fair race, moves around a ship under full sail as though she was motionless, and he can glide past a boat within a rod, when the water is clear, with that rapidity that the eye cannot trace him; a man would stand a small chance if a shark went for him. I have been in the water among sharks where half a dozen large ones could see me at one time, and never especially regarded myself in danger from them, from simply swimming around where they were; but in a few instances when fishing for them and other fish, I have been a little alarmed. On one occasion I mounted the bow of the boat to strike a large blue shark with a small harpoon, and on planting the iron in the fish I lost my balance and fell overboard, and in striking out to swim caught a turn of the line around my ankle, and I reckon if the iron had not torn loose, I should have gone to "Davy Jones' locker"—as it was, I got pretty well choked with salt-water. On another occasion, while fishing for cod, I picked up a bunker, mashed it with my heel, and commenced to wash it overboard to bait the fish I was seeking. All at once the water began to boil under my hands, and what should I behold but no less than five large switch-tails, and one of them, as large around as a barrel, made a grab at the bunker in my hands, and they had the water boiling like a caldron for the space of two rods around. You can imagine I was not long in taking my hands from the water. The stories told about sharks eating people have been mainly circulated by officers of vessels. An old pet shark is a Godsend to a ship in port to prevent sailors swimming on shore for rum and other purposes. Currency has been given to the fierceness of these fish, until the danger has been so wonderfully magnified that even those who circulated the stories have frightened themselves. I cannot believe a shark ever bit a man while in the water, knowing it was a man, but from mistaken identity there may have been a very few cases of undoubted reality. Sharks are accustomed to follow vessels and attach themselves to them for what they can pick up to eat, and always when the cook empties the refuse of the galley, and as he splashes in the water, the old sentinel is on hand for his share.

STRAIGHT BORE.

**SONG OF THE MOCKING BIRD.**—Last night, at 11 o'clock, a mocking bird commenced his song from the top of a tree that overshadowed my house. At first I was inclined to believe that there was some fixed order or stated repetition in his mimicry of the songs of other birds, and to find out if there was I jotted down with a pencil his notes as repeated. After a prelude he dashed off into the songs and notes of other birds, repeating them over, from four to six times, with a distinctness and deliberation seldom heard.

Whippoorwill, house-wren, sparrow-hawk, house-wren, tufted titmouse ("keep it"), summer red bird, brown thrush, house-wren, blue bird, king bird, blue bird, blacksmith's hammer, or anvil, young mocking bird, Guinea-fowl ("po-track"), house-wren, "keep it" blue bird, king bird, martin, house-wren, cat bird, young chicken, sapsucker, young mocking bird, fly catcher, house-wren, golden-wing woodpecker, Baltimore oriole, pewee, young mocking bird, "Poll's a good weaver Dick" jay, "keep it" house-wren, song thrush, killdeer, young mocking bird, king bird, note of alarm of brown thrush, cardinal grosbeak, sparrow-hawk, house-wren, young rooster, tufted titmouse, whippoorwill.

After getting back to the whippoorwill he did not go through in the same order as before, but varied his repetitions of the song of the wren with the notes of the sparrow-hawk. The next time the notes of the bluejay seemed to strike his fancy, and the sharp "jay, jay, jay," and the softer "kalip, kalip, kalip," were repeated over and over again. The song was interspersed with trills and catches and notes of his own. The family duties of Mrs. Polly Glottus being over for the year, and food being abundant, her better half has nothing to do but serenade her, which he does with a vim, singing—as "darkey Dixon" played the fiddle—"pretty much all the time."

Corinth, Miss., June 18, 1877.

**FRESH WATER FISH IN SALT WATER.**—In *FOREST AND STREAM* of May 17, we mentioned fifteen different varieties of fishes, included in nine different families, that live equally well in fresh and salt water, as they were debarred from either. The following from the *Scientific American* virtually sustains our position, though the writer starts with the contrary assumption:

It is well known that fresh water fish cannot live in salt water and *vice versa*, and it has been supposed that the reason existed in some poisonous effect which the inappropriate water exerted. M. Paul Bert has recently been investigating this subject, and his conclusion is that the death of the creature is not due to any toxic action, but is simply a phenomenon of osmosis or transmission of fluids through the membranes. In order to prove this it is only necessary to weigh the animal before and after the experiment. A frog, for example, plunged in sea-water loses one-third its weight. If only the foot of the frog be introduced the blood globules can be seen to leave the vessels and distribute themselves under the skin. If an animal be taken, the skin of which is not entirely osmotic, the same phenomena occur in the bronchial system.

There are certain fish, however, which exist sometimes in salt sometimes in fresh water, changing their habitat in different periods of life or of the year. It, therefore, in view of the above, becomes interesting to see how M. Bert applies his discovery to such apparent exceptions to the general rule. A fresh water salmon, for instance, plunged abruptly in sea-water resists the effects longer than any other fresh water

fishes; but he dies within five or six hours. This shows, according to M. Bert, that the fish never proceed suddenly from fresh to salt water, but enter brackish water where the tide ebbs and flows, and live there a sufficient time to habituate themselves to the change. This accounts for the frequent discovery of large numbers of such migratory fish in the vicinity of the mouths of the rivers which they ascend.

The converse experiment of inserting sea fish in fresh water produced analogous results. The gills were the seat of alterations, the same as those noted in fresh water fish placed in salt water. M. Bert also observed that the life of the sea fish could be prolonged by adding salt to the fresh water, thus adding further confirmation to his theory.

**TAME FISH.**—Pliny Jewell has a great deal of satisfaction every evening in feeding the crowd of gold-fish which swarm in the lake on his premises. The fish have learned to look for his daily visits. He first places a quantity of crackers in the water near the edge of the lake. The fish will not touch these, as they are for the birds who come flying down in flocks to get their evening meal. Then Mr. Jewell goes to the other side of the lake, and ringing a small bell, the water is seen to bubble and boil with the fishes which come hastily to the edge and grab at the bits of cracker and bread thrown into the water for them. Even the frogs and turtles come up for their share, and so tame have some of the frogs become that they will come out of the water and hop to Mr. Jewell's feet to pick up the crumbs that are dropped. The turtles eat ravenously and do not show the slightest sign of fear. One and all, birds, frogs, fish and turtles, seem to heartily enjoy their evening meal.—*Hartford Times.*

**THE RIBBON FISH.**—In a letter to *Land and Water*, Frank Buckland gives this description of this singular fish:

I have received, through the kindness of a correspondent at Nice, a very interesting and remarkable specimen of a ribbon fish. I make him out to be a *regaleus*. I have never before seen one of these most curious fish in the flesh. It measures five feet, is about a quarter of an inch thick, and is of a silvery hue, not unlike the color of the silver-hair tail. Upon the top of the head there are filaments, which, when stretched to their full, are about eight inches long. The head is very remarkable; altogether it is not unlike the shortened head of a horse. The mouth is prehensile, and so peculiarly formed that it is quite worthy of a figure; the eyes are very large and circular; the iris of a lustrous silver color. Behind the head the body is two inches and a half deep, in the middle two inches, at the tail a quarter of an inch. When held up to the light it is almost transparent; the vertebrae can with difficulty be seen, but with the movement of the fingers each vertebra will give a slight crack at the junction with its neighbor. The vertebrae are longest and thickest toward the tail end, at which there are sharp spines. It is covered everywhere with a fine silvery powder, which readily comes off in the hand. It has a crest of about an inch in height, which runs down the whole of the back. The rays forming the crest are united to double pillars of very slender bone. In substance it is very delicate, and begins to dry and harden almost immediately on exposure to the air.

I cannot find much about this fish in any of my books. This family of ribbon-shape form consists of seven genera and twenty-six species. Mr. Swainson remarks of it as follows:

It contains the most singular and extraordinary fishes in creation. The form of the body, when compared to fishes better known, is much like that of an eel, the length of the body being in the same proportion to the breadth; but then it is generally so much compressed that these creatures have acquired the popular name of ribbon fish, lath, or deal fish. The body, indeed, is often not thicker, except in the middle, than is a sword, and being covered with the richest silver, and of great length, the undulating motions of these fishes in the sea must be resplendent and beautiful beyond measure. But the wonders of the mighty deep are almost hidden from the eye of man. These meteoric, silver-coated fishes appear to live in the greatest depths, and it is only at long intervals, and after a succession of tempests, that a solitary individual is cast upon the shore with its delicate body torn and mutilated by the elements on the rocks, so that with few exceptions they are scarcely to be regarded as edible fish.

According to this authority, the Mediterranean has hitherto produced the largest proportion of the family, but it is distributed from the arctic regions to the sunny shores of India, so that probably a trifle have not yet been discovered.

**HARBS OF ANTS.**—Last week as I was coming in the gate my attention was attracted by seeing a stream of ants moving across the walk, going in different directions. They were traveling in a belt about four inches wide, and moving very rapidly. Of those going in one direction each had a large ant egg in its mouth. I followed the empty "mouthed" ones, and found they were robbing a nest of red ants. The nest was about one foot across, and was covered with red and black ants engaged in a most desperate battle, the reds trying to defend their home from their thievish enemies. At times the ants would form in little balls sliding and rolling over the ground. I observed that the black ants that were engaged in stealing took no part in the fight; but would seize the eggs and make for their own hill, leaving the fighting to be done by the rest of the band. The black ants, in making these depredations had to cross one carriage drive, two plank walks, and climb up a terrace two feet in height, the distance between the two hills being one hundred and fifty-two feet through the grass of an ordinary lawn. Out of curiosity I killed one of the black ants and took it to a jeweler and had it put in the balance with the egg it was carrying, when the egg was the heaviest, which shows the remarkable strength and endurance of these interesting insects. I once noticed a small red ant trying to carry a worm several times as heavy as itself up a small mound, on the top of which was its nest. After trying several time without success, it ran up the hill and disappeared in its hole, and presently returned with quite a number of companions, who easily carried their captive into the nest in spite of his struggles.

J. S. S.

**WHY EYES SHINE IN THE DARK.**—It is often asked why the eyes of many animals exhibit a peculiar brilliancy which is remarkable in the dark. When darkness is absolute, no light is emitted, a fact which has been established by careful experiment; but a very small amount of light is sufficient to cause the luminous appearance of the optics. This brilliancy is due to a carpet of glittering fibres, known as the *tapetum*, which is but a carpet of glit<sup>ting</sup> fibres found in the retina of certain animals

## CAPTURE OF Buteo HARLANI (AUD.) IN TEXAS.

GAINESVILLE, Texas, March 18, 1877.

EDITOR FOREST AND STREAM:

As I have never seen any record of the capture of *Buteo harlani* in Texas, I submit the following description of one I shot on November 16, 1876:

Size.—Length, 21½; extent, 49; wing, 16; tail, 10; tarsus, 3¼; greenish yellow,  $\frac{1}{16}$  to 1.85 (chord of ob.)  $\frac{1}{16}$  to 2¼; bill, blue at base,  $\frac{1}{16}$  to 1. The "looming" of the upper mandible approaches nearer to a tooth than in any of the *Buteones* I have examined, in fact grading close up to some of the accipiters, in this respect. The cere is greenish yellow, 4th quill longest but decidedly "sinuate tapering," first three quills emarginate; first quill is equal to the 8th in length. The black bars on the tail are definite, and run in waves, or rather form arrow heads on each feather with the point toward the base of the quill; tibial feathers long, eyes yellowish ash.

The plumage is in general blackish with a decided purple lustre, and much white spotting on many of the feathers. Throat white, with fine black pencillings. The "marbling" of the tail is not so definite as I expected to find it, and upon this character Mr. Ridgway places considerable emphasis.

I find those birds much more wary than any of the *Buteones* that winter here, and in fact it was rather an accidental capture of this one. I was standing on the bank of a creek in an open field with a few bushes surrounding me, when I observed this bird coming down the creek toward me. Screened by the bushes, I awaited his arrival, then rose up and fired. My gun being charged with small shot, I did not bring him down, but could see that my shot had taken effect. At the report of my gun he dropped a quail, which, upon examination, appeared to have been killed some time, as the muscles were relaxed, and the feathers damp from the dew of the morning. I examined it for shot holes thinking it must have been crippled, but could find none. Four hours after the first shot I shot the same hawk from its perch, and identified it by the dried blood upon the feet and feathers. I would like to know if the "looming" of the upper mandible and the color of the eyes has been noted by other observers?

From some cause I failed to note the sex of this bird, which I regret very much. It is now in the possession of Mr. R. M. W. Gibbs, Kalamazoo, Mich.

G. H. RAGSDALE.

[The specimen above described has been sent to the Smithsonian Institution, and is pronounced by Mr. K. Ridgway a true *Buteo harlani*.—Ed.]

## BIRDS KILLED BY TELEGRAPH WIRES.

POTTSVILLE, Pa., July 30, 1877.

EDITOR FOREST AND STREAM:

A small party of us left town last week on a fishing excursion, which was limited to Schuylkill county waters only. After spending three days in very successful angling, we returned home feeling much better and wiser. During our rambling we noticed that game of every kind is very abundant, and, if not molested, the field and forest in this section promises unusual charms for our sportsmen during the coming fall and winter season.

Notwithstanding the frequent charges hurled at the illegitimate action of the destroyer of game birds by means of trapping, snaring, etc., and those disregarding the season for propagation, yet we feel there is pardon for him when we seriously contemplate the many hundred thousand birds killed annually by flying against the telegraph wires, which form a murderous network over the greater part of the country. In support of this assertion it is only necessary to give some facts observed during the few days of our rusticating, the most noteworthy of which was the finding of nearly one hundred dead birds in close proximity to the telegraph wire in a distance of four miles. Several of the birds we saw strike the wire and fall, and the appearance of those found dead was, in all respects, similar to that of those seen to strike and fall. Among them were a few young quails, flickers and robins; but the majority of the birds were larks, whose night is singularly wayward and impulsive, which may account in a measure for their inability to clear the wire.

Have any of your numerous intelligent contributors made similar observations?

DOX PEDRO.

[Dr. Coues, in a recent number of the *American Naturalist*, has discussed this matter at considerable length, and we commend his article to our readers' notice.—Ed.]

**ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING AUG. 11, 1877.**—One least bittern (*Ardeola exilis*); three golden-naped amazons (*Chrysotis auripallata*); one gray parrot (*Psittacus erithacus*), presented by Dr. J. W. Clowes, N. Y. City.

The gray parrot or laro is a native of West Africa; has a plumage of an elegant ash-gray color, which is beautifully set off by a tail of the brightest crimson. It is remarkable for its tenacious memory, being able to repeat whole sentences with facility, and is very easily taught. The interesting and amusing anecdotes we read of the parrots relate for the most part to this species. It is extremely long lived, several well authenticated instances being recorded of its having attained the age of 60 or 70 years. In the wild state it builds its nests in the hollow trees, and Buffon mentions a certain pair that bred and hatched in captivity a brood for five or six consecutive years. It was among the earliest species imported from Africa, and nearly every vessel now that leaves the west coast brings a number of these birds, which are the property of the sailors.

W. A. CONKLN, Director.

**ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDEN DURING WEEK ENDING TUESDAY, AUG. 7, 1877.**—One great horned owl (*Bubo virginianus*), presented; one alligator (*A. mississippiensis*), presented; one snowy owl (*Nictaea nivea*), presented; two pigeon hawks (*Accipiter fuscus*), purchased.

ARTHUR E. BROWN, Gen'l. Supt.

—English scientific circles are just now enjoying the rare treat of interviewing a real live young gorilla, which is the first one ever successfully brought into Europe. Frank Buckland in a letter to *Land and Water* says the young stranger may prove an unwelcome witness against the Darwinian theory.

—A Mr. Tominette, of Hamburg, Germany, has invented a method of preserving natural history specimens, by means of an injected gas, which absorbs the moisture of the tissues, and drives it out through the pores. Prepared thus, specimens preserve perfectly their form and color.

—The peculiarity of the fly is that he always returns to the same spot; but it is the characteristic of the mosquito that he always returns to another spot. Thus he differs from the leopard, which does not change his spots. This is an important fact in natural history.

## Woodland, Farm and Garden.

## FASHION IN GARDENING.

THE higher the point of civilization at which a country arrives, the more its inhabitants become the votaries of fashion, and that we in this country enjoy no immunity from the infliction is everywhere evident. If this did not extend beyond an indulgence in the luxuries of everyday life it would be of less consequence, but when the infliction spreads to matters of such importance as horticulture and arboriculture it behooves those who take an interest in these pursuits to look the matter fully in the face. It may be said that gardening, as it exists at the present day, is a luxury, and that, consequently, it must be governed by such fanciful laws as rule matters of a kindred character. This, it must be admitted, is correct so far as it relates to the purely decorative element, but here it does not stop. The introduction of a new genus of plants, or the resuscitation of an old and in many cases an undeservedly neglected one, appears to be the signal for a universal mania in favor of the favorite of the hour, to the comparative neglect of other things. When a useful flowering or bedding plant, such as a *Gladiolus* or *Coleus*, makes its appearance, why should we for years run after varieties of them by the hundred, that have barely an infinitesimal difference from each other? In the case of new roses there might be some excuse, for any improvement relating to the Queen of Flowers is sure to be hailed with delight. Give us the true rose fragrance in a climbing rose, or bright color, combined with good habit and free flowering in a tree rose, and we would all rejoice; but how often are our expectations realized in proportion to the disappointments we experience? At present *Lilies* seem to share the general favor with the *Rose* and *Gladiolus*, and this may be looked upon as simply the *amende honorable* for the neglect into which this flower has been allowed to fall. In flowering plants, *Verbenas* have had their day. Zonal *Pelargoniums* now take the lead, but for the flower garden or parterre, far ahead of them come the "foliated plants," the *Coleus* and *Alternanthera*, the *Centaurea* and *Linaria*, the white edged and bronze leaved Zonal, and other plants of a like character. In matters connected with the more essential and indispensable branch of gardening, let us notice the rage for new varieties of Potatoes, Tomatoes and Corn, nine-tenths of which are deficient in general properties compared with others they are intended to supplant. In fruits it is even worse. How much disappointment has been experienced by those who have supplanted old and well tried varieties of Grapes, Peaches or Strawberries with newer varieties, which, after a trial, have in many instances been either rooted out altogether or, headed over, made to do duty as stocks? These are a few of the positive inflictions which fashion imposes on us in matters horticultural. Those of a negative character are equally baneful. What have we to compensate us for the neglect into which numbers of old and tried friends among herbaceous plants have been allowed to fall? Nothing except blazing stripes and circles of red, white and yellow, the glare of which is, fortunately, short-lived, for their repelition becomes a positive infliction on the eye. Let it not be understood that we would discountenance healthy progress in any thing appertaining to horticulture, for in it, as in other matters, it is human to require novelty and change. But the evil is that whatever becomes fashionable, either in any particular family of plants or in the manner in which we employ them, we for a time lose sight of others of far greater importance. Again, if we look to arboriculture we find that fashion has inflicted something more serious than a passing disappointment. Both in the vicinity of the villa and in that of the more extensive country seat it is desirable to get as much variety as possible; this no one will attempt to deny; but have our planting operations been judicious? Have they not been governed to too great an extent by a rage for novelties in the shape of Coniferous plants, numbers of which are unsuited to the situations in which they have been planted and are incapable of withstanding our severe winters, leaving blanks that take years to fill up. Think of the numbers of grand deciduous trees and flowering shrubs that, comparatively, have been cast unto the shade by these new-comers. Let us then encourage planting the more serviceable oak, ash, or hickory in our parks and hedge-rows, trees that are ever increasing in value; above all, let us not be carried away by the fashion of the hour for one or another particular kind of plant or flower, but remembering the more useful and tried friends that are always beautiful, thoroughly test the newcomers before we give them a prominent place in our gardens or pleasure grounds.

**REMEDY FOR STINGS.**—Mrs. Henry Ward Beecher says that wet tobacco is a certain remedy for the stings of bees, wasps, hornets, etc. The application of moistened tobacco should be immediate, and the resulting relief is sure and speedy.

—English butchers have invented a method of butchering animals by the explosion of a small primer of dynamite, which is attached to the forehead of the animal to be slaughtered, and is exploded by means of an electric fuse.

—The mean mid-day temperature at New Smyrna, Florida, for the month of July was 87 deg. 23 m. Maximum, 96 deg.; minimum, 77 deg.

**CRASSULA COCCINEA.**—This is an old greenhouse favorite, much thought of in former days, when gardeners used to grow specimens of it several feet through, each shoot being furnished at its summit with a broad truss of waxy-scarlet flowers, showy and sweet-scented. The plant also grows out of doors freely in summer, and when in flower makes one of the most brilliant and effective of beds. This plant is known nowadays as *Kalosanthes*. To flower it well it requires to be grown in hot, dry quarters. Cuttings, which strike very easily, should be made from the young shoots which have not flowered in August or early in September. Make the cuttings about three inches long; do not stop them, but divest them of a few of their bottom leaves, and pot each singly and firmly in a three-inch pot, using a light compost of sand, leaf-mould, loam, and pounded bricks or crocks. They will soon root if placed near the glass in a warm pit, or an intermediate house shelf, if they are not damped too much at top or bottom. When rooted remove them to a cool dry greenhouse for the winter, and give scarcely any water till spring; the object at this time is simply to keep them at rest. About the beginning of March the plants may be potted in 8-inch or 9-inch pots, which is a suitable size for plants intended to have six or seven shoots. A little heavier compost should be used for this, the final potting, and with it plenty of broken crocks or bricks, taking care also to drain the pots thoroughly. After potting, the plants should have a growing temperature near the light. A warm greenhouse or pit will do, but do not give too much water at any time.

At this stage some of the plants will break up into a number of shoots at the top, and the others will keep to a single shoot only. The former should be thinned out to six or eight shoots, and the latter pinched at the top to make them break; also the young shoots secured in this way will bear the flowers. By May the plants will be growing fast, and at this time they may, in warm localities, be plunged out of doors in a warm corner. In front of a hothouse is a good place for them, and it is a common practice to plunge them in sand, which gets hot with the sun; otherwise they need not be plunged at all, but simply set on a hard surface. In cold localities it is better to grow the plants under glass all summer, with plenty of air and sun. Whichever plan is adopted, let the plants from this time grow uninterruptedly, and before cold weather sets in take them into any house where the temperature is genial and dry. Here they will show flower, if the trusses are not already in an advanced state, and the season of flowering may be prolonged by keeping the plants in cool houses. If the plants are intended for planting out, they must simply be wintered in a cool house, and not permitted to flower, and planted out the following season, where they will be certain to flower and make a bright display.—*J., in the "Garden," London.*

**CUCUMBERS IN RUSSIA.**—On my way home from the fair of Nijni-Novgorod, says a correspondent of the *Daily News*, I was again struck with what I often remarked before, viz., the profusion of water melons and cucumbers, which were being everywhere offered for sale. Pyramids of melons and water-melons, like cannon balls in an arsenal, were heaped up in every direction, and as for cucumbers, you couldn't help fancying that a plague of cucumbers, like locusts, had descended upon the earth. All along the Volga, from Astrakhan to Nijni, the whole population seemed engaged in eating water melons. Their price being three sopskes, equivalent to one penny, put them within the reach of even the moderately wealthy. At every wood station that we stopped at, the water melon and its rival, the sunflower, were the subject of a lively traffic. Saratov seemed to be the headquarters of this latter fruit, but we had outposts all along the line. But if the water melon and the sunflower are luxuries and pastimes, the cucumber is a law and a necessity. You never see a Russian peasant at dinner but you see the lump of black bread and the cucumber. A moniek's dinner may be said to consist of *x* plus cucumber. The *x* will consist of his favorite cabbage soup (*schetchi*), with or without meat in it, and sometimes in addition to it the equally famous grit porridge (*kasha*). Sometimes the *kasha* is without *schetchi*, and sometimes the *schetchi* is without the *kasha*, but whether in separation or combination, the cucumber, at least, is always there; and should *x* equal zero, as I am afraid it sometimes does, then the ever-faithful cucumber does duty for all the rest. Cucumber seems certainly a singular dish to be so national in a country with a climate like Russia's. It is the last that one would select *a priori* for the post; but this is only one of a great many singularities one meets with. The cucumber costs the thirtieth part of a penny about the Volga; perhaps this fact will explain the anomaly.

**BUDDING FRUIT TREES.**—P. T. Quinn, in the mid-summer *Seriviner's*, gives these directions for budding orchard tree:

The proper time for budding extends from the middle of July until the first of September. Whenever the bark separates easily from the wood, the buds may be set, with fair chances of success. The outfit for budding consists of some narrow strips of bass matting, such as comes on the inside of coffee-bags, and a pocket-knife with a single blade, with a small piece of ivory fastened in the end of the handle. When the incision is made the ivory is used to raise the bark up on either side, so that the bud may be pressed into place. The buds to be present year's growth, these that are most matured being selected. The leaves may then be clipped off the branch of buds; leaving say half an inch of the leaf stalk attached to the bud. Then with a keen-edged knife cut off each bud separately round a half to three-quarters of an inch in length, leaving a thin slice of wood at the eye or bud. These should be kept moist and protected from the sun or air until set; exposure even for a short time may prove fatal.

When the whole top or any part of it is to be budded over, select the spot for each bud in a smooth part of the branch, not too large, say from one to two inches in diameter. On this part make an incision through the bark in the form of the capital letter T, and raise or separate the bark from the wood with the ivory on the handle of the knife. The bud may then be pressed into place, cutting off square the portion that goes above the cross incision. Then with a strip of the bass matting wrap firmly around the branch above and below the eye, fastening the end of the strip by a slip-knot.

**TRANSPLANTING FOREST TREES.**—Pioneer, in the *Prairie Farmer*, says, in regard to transplanting forest trees:

Before taking up a tree, mark it in some manner so you will know which is the north side, so as to be able to reset it in exactly the position it grew in the woods. This may seem to be many of no importance, but to those who know that there is in the bark and wood of all trees a radical difference between the north and south sides, the north side being close grained and tough, while the south side is invariably more open grained and trashy, or soft, the importance will be seen. If this is done, your tree does not have to undergo a complete change in all the parts, and is ready to start off and grow at a proper time as readily as though it had not been moved.

**ASPARAGUS IN OLD TIMES.**—At Ravenna the Romans cultivated asparagus with most extraordinary results, the stems weighing three pounds each. The same as to-day, they allowed it to boil but a short time, as it was a favorite expression with Augustus, when he wished a thing accomplished quickly, "Let that be done quicker than you would cook asparagus." The Roman cooks chose the finest heads of asparagus and dried them. When wanted for the table, they put them in hot water and boiled them a few minutes, a plan good enough to be followed at the present day. B.

**AN OLD ROSE.**—Never give up a decaying rose bush till you have tried watering it two or three times a week with a soot tea. Make the tea with boiling water, from soot taken from the chimney or stove in which wood is burned. When cold, water the bush with it. When it is used up, pour boiling hot water on the soot a second time. Rose bushes treated in this way will often quickly send out thrifty shoots, the leaves will become large and thick, and blossoms will greatly improve in size and be more richly tinted than before.—*Exeter News Letter.*

—An ice machine in Dallas, Texas, just finished, produces ice cakes thirty feet long and six feet wide, weighing from 10,000 to 12,000 pounds each. They are formed by freezing fine rain or spray. When the freezing is done the bottom and sides of the cake are thawed loose from the inclined plane, and the cake slides out upon a platform, where it is cut into pieces six feet square. Four cakes a day are frozen. The works cost \$30,000.

—Eagle Island, near Newburyport, Mass., has a coffee tree raised from seed smuggled during the time of the embargo. The tree bears, but the berries do not ripen, and have very little of the coffee taste.

—In the Luxembourg Gardens of Paris are eighty lilac trees in full bloom, which were planted by Marie de Medicis two hundred and fifty years ago.

—An eagle shot in Wisconsin the other day was found to have twelve bullets in him. It must have been a balled eagle.—*Ee.*

**GALE'S PATENT TENTS.**—Rev. F. Savage, of Albany, widely known as a camper-out in Florida and the Adirondacks, writes as follows:

July 31, 1877.

Gale & Co., Boston:

SIRS—I have just returned from a three week's camping expedition in the Adirondacks, and have had the three (3) tents bought from you put to the severest tests of exposure, both as to wind and storm, and do most unhesitatingly say they are the most complete thing of the kind I ever used.

1. They are easily put up and taken down.
2. They are perfectly waterproof.
3. They are of a good height and all the room is available.

Our party asked for no better. They were admired by all who saw them, and one party insisted on buying one of ours that was to spare. Rev. Dr. Duryea, of Brooklyn, and Rev. Dr. Irwin, of Troy, both of whom used your tents, endorse all I say about them. With kind regards,

Yours truly,

F. B. SAVAGE.

—*Id.*

**A NEW MINERAL WATER.**—Mineral water is firmly established as an indispensable summer drink. The average man, who formerly tried in vain to quench his thirst with soda-water, or some one of the many dia-bolical compounds labeled "small-beer," and had a headache and an uneasy stomach afterward, now calls for some kind of mineral water to stop his thirst and aid his digestion. But even in mineral waters there is a preference to be had. If none of them are absolutely injurious some of them are vastly more beneficial than the others. A comparatively new spring has been discovered, which seems to belong to the desirable class which has all of the health giving properties, with no impurities whatever, and what is of almost equal importance, has a pleasant flavor also. It is called the Apollinaris Natural Mineral Water. It comes from a natural spring near Neuenahr, in Rhenish Prussia. The yield of this spring is something enormous, being estimated at 400 quarts every four minutes, and at 40,000,000 quarts a year.

It is especially urged in favor of the Apollinaris Water that it contains a larger amount of carbonic acid than any other water, either natural or artificial. It is estimated that more than 99 per cent. of the gases contained in it are carbonic acid, which gives it that strong effervescence which causes it to remain fresh and brisk long after the cork is withdrawn. The mild alkalinity of the water gives a soft and pleasant tone to this effervescent and refreshing beverage, more agreeable to most palates than the very marked and saline flavor of other springs. The verdict of the mouth is confirmed by the whole digestive tract. The too acid condition of the stomach, from which many suffer, is happily corrected by this alkaline water, and it is entirely free from poisonous metals, as lead, copper, etc., as well as organic impurities.

Dr. William A. Hammond says: "For several months past I have made extensive use of the Apollinaris water in cases of nervous irritability attended with dyspepsia and lithic acid or oxalic acid diathesis, and always with good effect. It appears to me to be indicated in all cases in which the Vichy Waters have been heretofore prescribed. As a daily beverage, alone or with wine, it is, in my opinion, far superior to Vichy, Seltzer, or any other mineral water." Dr. Fordyce Baker is scarcely less emphatic, saying: "I have made use of the Apollinaris Water for six or eight years past, and regard it as by far the most agreeable of all the mineral waters as a beverage for the table, whether drank alone or mixed with claret, sherry or champagne. It is light, sparkling and easy of digestion, and I am convinced of its utility in certain catarrhal conditions of the mucous membranes, especially of the stomach and bladder, and in those persons predisposed to gout in its milder forms."

Its freedom from metallic poisons, already referred to, enables the chemist to coincide with eminent medical authorities in commending it as an absolutely pure, wholesome, as well as pleasant mineral water superior to all others as a daily beverage.—*See ad.*

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### RUSSIAN SETTERS.

**A**LAS! oh, "Amicus Veritatis," that in criticising my remarks about Clumber spaniels at the New York Bench Show, thou shouldst have paved the way with a compliment that has so nettled "Canonicus." I have just been enjoying the treat of reading the numbers of *FOREST AND STREAM*, published during my two months' absence beyond its reach, and after the terrible slashing at the hands of "C.," I ought, no doubt, to feel too weak to hold a pen. "Canonicus" states that he did not write his letter in a "carping spirit," and certainly his spirit seemed to partake less of the nature of carp than of a shark that wished to devour me for my presumption in daring to express an opinion.

Thoroughbred, straight-haired Clumber spaniels I have seen, but not at the New York Bench Show. That was more my misfortune than my fault. It seems I looked for them in vain, and the brace described by "Amicus Veritatis," as corresponding to the type of the class, must have been elsewhere than among the spaniels at the various times I looked there for them. I could not have seen them and passed them by unnoticed, for, as the editor of *FOREST AND STREAM* remarks, their characteristics distinguish them unmistakably from any other breed. Of course I knew that in making any remarks other than complimentary, I was liable to tread on some one's corns, and bring down contempt upon my head. I wrote my letter while traveling, and acknowledging that I had not the "Young Sportsman's Manual" as a guidebook, "Canonicus" will be convinced that I was literally at sea—*ab initio*. I did read Frank Forester's writings, and some of my theoretical knowledge thus acquired has been upset by practical experience. While sharing with "C." the admiration of Mr. Herbert as a sportsman, I do not regard him as an authority on classification, nor at the present time the best authority on any department of sporting matters. "C." quotes what Frank Forester thinks is a "Russian setter."

"Rather taller than the English or Irish dog, his head shorter and rounder than that of this family, and, like the rest of his body, is so completely covered with long, woolly matted locks, tangled and curly, like those of the water poodle, only ten times more so, that he can hardly see out of his eyes," and he adds, "I have never seen a pure one." If any reader of *FOREST AND STREAM* has ever seen a *pure one* can he give its pedigree? One frequently hears of the "cross of a Russian setter" or a "half-breed," but where are the "pure ones," and their pedigrees? Modern works on the dog make mention of the "Russian setter," and give some brief description usually taken from a previous publication, adding the remark that "they are rare," or the "pure breed is seldom seen." But little information is given in regard to this dog, whose short, rounded head and curly coat "like that of the water poodle, would entitle him to classification as a retriever. Were such a dog sent to a bench show, with no accompanying information, and it rested with the committee in charge to classify it, would it be placed among the setters? The lack of more definite knowledge of the history of this dog, and the meagre description given by standard authorities in canine matters, tend to corroborate an opinion that at the least there is much doubt if it is, as "C." states, "a setter strain that has been bred and kept strictly pure for the past century." I do not accept as a proof of this fact "C.'s" quotation from Herbert, "Russian setters have what is called more point. They crouch lower, and steal in more silently on their game than any other dog, consequently they are the best in the world over which to shoot game when it is wild." This is neither any argument nor proof that it has been *purely bred as a strain of setters*. It is my good fortune to have friends among the Russians, and to one of them in particular, a resident of Riga, am I indebted for information that I considered valuable, coming, as it did, from a sportsman well posted in regard to this subject. We had much discussion upon the topic of mutual interest, field sports and their accessories, and of sporting dogs in particular.

He assured me that all their stock of setters came from England; and that the dogs described as "Russian Setters" were the result of a cross between setters and native dogs. He did not consider these dogs entitled to classification as a breed of setters, for they differed from that well established breed in important characteristics. Nor did he know of them being bred for successive generations as a pure strain without cross.

The usefulness of this dog in the field I would not deny, nor would I that of any other dog whose good qualities have been proved. If "Canonicus" has "gun-shy and timid brutes," very likely a cross with the dog described would improve them. If his dogs are pointers, let him try a cross with the Dalmatian breed. But I can find for him plenty of setters whose courage, dash, or retrieving qualities would not be improved by a cross with other breeds, and whose beauty of form, coat, and color, would be thus impaired. Few sportsmen desire great size for a setter, and "C." need not seek a cross to be pleased in this respect. I can inform him of a setter, a good field dog, that stands thirty inches at the shoulder. If

those dogs which, for size and coat, "might have passed for Newfoundlands," proved to the mind of "Canonicus," by their "dash in action, staunchness on game, crouching instead of pointing the birds, and admirable retrieving qualities," that they were true setters of a pure-bred strain, might not a well-trained Lurcher thus prove an equal right to the same distinction?

I know that in expressing my belief in regard to the "Russian setter," I was making a statement likely to provoke discussion, but it is upon a subject that is of interest to sportsmen, and I would much like to see something from the pen of "Istone" on this subject, or from some one better known to the public and more competent to speak than myself. Notwithstanding "C.'s" accusation of "lamentable ignorance," etc., he has failed to give me more light on the subject, and I still believe that there is no established pure breed of setters peculiar to Russia.

AMICUS CANTUM.

**DOGS FOR CLOSE COVERT.**—In the course of my summer wandering in New Hampshire this year I had occasion, in following the course of a stream in pursuit of its speckled denizens, to pass through a swamp where the underbrush was so dense as to form an impassable barrier for either man or beast. Following the bed of the stream, though, I avoided the brush and accomplished its length. After getting in some distance, at almost every step as I proceeded woodcock flew up right and left, until the place seemed fairly alive with them.

Now, I am not much of a shot myself, but the sight of those birds set the blood tingling through my veins in a way quite unusual. Of course I have marked the place and intend taking it in this fall. But one obstacle presents—the density of the underbrush; composed as it is principally of blackberry and wild rose bushes, both of the standard and running varieties, tangled together into impenetrable thickets, presents an impassable barrier to any dog of which I have knowledge.

A setter could not possibly accomplish it, perhaps a cocker might; but his bark is, in my mind, a great objection. I don't think you want your approach so thoroughly advertised. And then, too, I don't think he has bone and muscle enough to push through with.

I am told, though, that a spaniel does exist thoroughly mute and tractable, with long, low body and legs of great strength, to whom a thicket presents no obstruction, but on the contrary affords delight. Have I been deceived, or does such a variety exist, and where can it be procured? M. B.

[There are such dogs, and they are cocker and springer spaniels. They will work in tangled coverts, as described above, and so far from the bark being objectionable, most sportsmen consider it a desideratum, in order to give notice that the dog is on game. Formerly this was thought so important that, if a spaniel happened to be mute, he was hunted with a bell around his neck. The clumbers are invariably mute. A thoroughbred cocker or springer properly broken will not advertise one's approach any too soon, and will be found to possess sufficient bone and muscle, backed by plenty of ambition.—Ed.]

**PEDIGREES.**—Permit me to say through your columns to all persons sending pedigrees for insertion in the N. A. K. C. Register, it is necessary that the full address of owners be given. The address of breeders should also be given whenever practicable. I will furnish proper blanks on application. ARNOLD BURGESS, Compiler of Kennel Register.

**NAME CLAIMED.**—I claim the name of Black Jack for my black native setter pup, whelped Dec. 17th, 1876, by Dr. Wynn's Duke out of my Black Bessie, she by Halscy's Sport out of Arnold Burgess' "Belle." F. W. JONES.

—I claim the name of "Rival" for my pure liver and white pointer dog pup, out of champion Royal Fan, sired by champion Ranger. S. B. DILEY.

LAKE CITY, Minn.

—It may be interesting to know of Daisy. This fine bitch, who won the first prize at W. K. C. show, is being hunted on woodcock. Dick Steward, her trainer, writes that she works just like an old dog, and really needs scarcely any breaking, points and retrieves her birds naturally; her age is only fourteen months, and she pointed when only two months old. She is a great grand-daughter of George, imported by Sir Fred Bruce, and daughter of Flake.

**CLAIMING OF NAMES.**—In our last issue Mr. F. R. Ryer claims the name of "Con" for a setter puppy, the same name having been claimed by Mr. Rob't H. Morris in the issue previous. Mr. Ryer bases his claim on the fact that his dog was named in the *T. F. F.* of July 8th. In reply, Mr. Morris appeals to us as follows:

"As a constant and careful reader of the *FOREST AND STREAM* and *ROD AND GUN*, I have always considered it the only correct canine authority and register. I therefore claimed the name of "Con" for my red Irish setter pup, the name never having been claimed to my knowledge through the columns of your paper before. I do not desire a controversy with Mr. Ryer, but would be pleased to have your opinion as to who is right."

[When there were two or three different kennel registers, the priority claim in the columns of the *FOREST AND STREAM* might hold. Now all registers are merged into one, under the auspices of the National Kennel Club; therefore to it properly belongs the decision. We do our share in giving notice of the baptism, without standing as God-father to the canines, and therefore request that gentlemen settle these little matters themselves.—Ed.]

**THE NEWSBOYS' DOG.**—The newsboys of this city have long been the owners of a large Newfoundland dog, which answered to friendly salutations when addressed as "Tige." He was an intelligent animal, and enjoyed the benefits of a good education in his peculiar line of business. He knew all the police officers of the city, and whenever the boys felt like regul-

ing themselves in a social game of "chuck-a-luck" or "high die," Tige took up his position on the ramparts of safety, and never failed to give the alarm when a "peeler" hove in sight. During the Christmas holidays, and on all state occasions, he was decorated with all the gorgeous paraphernalia that the inventive talents of his keepers could suggest, and invariably, at the extremity of his caudal appendage, a "bunch of blue ribbons," and of which he was very proud, if the wag of his tail high in air could be taken as an indication of his internal emotions. Yesterday, about twelve o'clock, while rambling around the city in quest of his usual amount of recreation, Tige had the misfortune to encounter a piece of medicated dog meat. He smelled of it, and concluding that it was all right, he opened his mouth and took it in. It was not long, however, before "Tige" began to show signs of being sick. The news of his malady spread among the boys rapidly. He was taken in charge and brought to the place of rendezvous, in rear of the *News* office, and the medicine man of the newsboy brigade was summoned to his relief. He came, and prescribed copious draughts of sweet milk, which he ordered to be followed by heroic doses of castor oil, but the treatment was in vain. The boys rubbed him and bathed him, but it was of no use. Soon Tige's intelligent eyes began to lose their lustre, and he was no longer able to swallow. Mr. M. Keneff was sent for, and suggested that a dose of ipecac administered in hot water would "do the business" for the sufferer; but hot water could not be had, and as a dernier resort one of the boys tried to catch a bottle of steam with which to wash down the emetic. Before he succeeded Tige had breathed his last, surrounded by his friends, the recipient of all the attention they could bestow upon him. Late in the evening his funeral took place from the residence of the boys, near the corner of Twenty-ninth and Mechanic streets. They utilized the mail cart of the *News* as a hearse, and draping the wheels with crape and all the appropriate emblems of sorrow, they placed the remains of the dog in it, and covered them over with a white cloth. On the rear of the cart was this inscription, "Poor Tige is dead, our pet." Jimmy Heron was the marshal of the procession, and, mounted upon a mustang, he led the cortege through the streets. The hearse was drawn by the boys, who kept time to the measured taps of the drum at the head of their column. All the principal streets of the city were paraded, and, just as the sun went down, the boys dumped "Old Tige" into the bay from the plank on William's wharf. They offer a reward of \$10 for the policeman who gave him the poison. Thus ends the existence of a well-known character of this city.—*Galveston News*.

—Great Britain derives a revenue of £367,174 from the dog tax.

**STOLEN!**—A red Irish setter dog was stolen July 29 from Conlin's Gallery, 1,222 Broadway, New York. The dog is a little larger than the average size of his breed, and was marked as follows: Gray streak on head, large white spot on breast, and a few white spots on paws. He was not broken, but would "charge," generally drawing one of his fore paws under body. When stolen the dog wore a collar which had on it his license tag, No. 226. Any information given in regard to the whereabouts, or what may lead to his return, will be liberally rewarded. —[Adv.] FRED'K CONLIN, 1,222 Broadway.

## Sea and River Fishing.

### FISH IN SEASON IN AUGUST.

| FRESH WATER.                                 | SALT WATER.                                      |
|--|--|
| Trout, <i>Salmo fontinalis</i> .             | Sea Bass, <i>Sciaenops ocellatus</i> .           |
| Salmon, <i>Salmo salar</i> .                 | Sheepshead, <i>Archosargus probatocephalus</i> . |

| Land-locked Salmon, <i>Salmo gairdneri</i> . | White Perch, <i>Morone americana</i> .           |
| Grayling, <i>Thymallus tricolor</i> .        | Weakfish, <i>Cynoscion regalis</i> .             |
| Black Bass, <i>Micropogonias undulatus</i> . | Bluefish, <i>Pomatomus saltatrix</i> .           |
| <i>M. nigricans</i> .                        | Spanish Mackerel, <i>Scomber maculatus</i> .     |
| Masacaron, <i>Esox nubilifer</i> .           | Cero, <i>Cybinus regale</i> .                    |
| File or Pickrel, <i>Esox lucius</i> .        | Bonito, <i>Sarda pelagica</i> .                  |
| Yellow Perch, <i>Perca flavescens</i> .      | Kingfish, <i>Menticoccus nebulosus</i> .         |

**FISH IN MARKET.**—The market is well stocked; fish are abundant; and, with the exception of fresh mackerel, the prices are low. Our quotations for the week are as follows:

Striped bass, 20 cents per pound; bluefish, 10 cents; salmon, green, 25 cents; frozen do, 30 cents; mackerel, 15 to 25 cents; weakfish, 10 cents; white perch, 15 cents; Spanish mackerel, 25 cents; green turtle, 12 cents; halibut, 18 cents; haddock, 6 cents; kingfish, 25 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 8 cents; flounders, 8 cents; porgies, 10 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 10 cents; soft clams, 30 to 60 cents per 100; Long Island trout, 75 cents; sheepshead, 20 cents; whitefish, 18 cents; Canada do., 50 cents; hard shell crabs, \$3 per 100; soft crabs, \$1 25 per dozen; frog legs, 35 cents per pound.

**TROUBLE AMONG THAMES ANGLERS.**—The London papers of June 27th report an extraordinary trial at Guildhall before Baron Pollock and a common jury. The case was that of Jones against Gant, and was a libel case arising out of circumstances that were of interest to Thames anglers. The plaintiff was a cork dealer, carrying on business at Snowhill, and the defendant lives in Paternoster row. It appears that the Piscatorial Society give annual prizes for those who on a certain day capture the largest number of barbel. The defendant proposed to compete for this prize, and in September last repaired with a brother angler to Sonning, where after a careful examination of the water, he selected a "swim" which for some days previous to the contest he was at much trouble to bait with worms and grubs of a most spicy character, brought from considerable distance for that purpose. Monday, Sept. 11, was the day arranged for the interesting event, by which time it was hoped that a great many fine barbel, enticed by the unusual supply of refreshment, would be waiting to be caught. Mr. Gant took up his quarters at the French Horn, and all went pleasantly enough till the plaintiff made his appearance on the Saturday evening. This gentleman announced in his evidence that he had been a fisherman from his youth,

and that he had known the defendant, as well as the "swim" in question, for many years. On the Saturday evening Mr. Jones also went down to the river, and regaled the fish with ground bait at various spots, and early on Sunday morning he arose, and, equipped with rod and tackle, as well as with plenty of lob-worms and other delicacies, commenced operations against the fish. The complaint against Mr. Jones will be seen from the following letter, signed by the defendant, which was the libel complained of, and which appeared in the *Field* of September 16, under the heading "Appropriation of Baited Swims:"

Sir—As you are probably aware, the members of the Piscatorial Society have an annual barbel outing, which came off on Monday last, September 11. Mr. Jardine and myself decided upon going down to Sonning; I went down on Saturday, September 2, and after trying various "swims," decided on one for our day's angling. This swim I baited daily up to Saturday, September 9, so that a day should elapse from the last baiting to the day of fishing. On the evening of this day, September 9, a person came down from London to fish. When I found that he was going for barbel I told him the object of our visit and the "swim" I had selected and baited. Mr. Hull, of the French Horn, also told him, and a promise was made by him that our "swim" should not be interfered with. On Sunday morning the man crept stealthily away from the house a little after 5, went to the "swim," and I saw him fishing it two hours after; and again on Monday morning, when Mr. Jardine and myself reached it at 9 o'clock, he was in the act of leaving it. I make no comments on this, for there is nothing I could write sufficiently expressive to convey my contempt. I brought the subject before the Piscatorial Society on Monday night; there was but one feeling—that of disgust—that such a person should call himself an angler; and it was put by the chairman and carried unanimously that I should send to the *Field*, giving the man's name and address, which is John Jones, cork dealer, King street, Snow Hill.

J. W. GANT.

The plaintiff denied that he had purposely fished in Mr. Gant's "swim," or that its position had ever been explained to him. A long correspondence ensued in the *Field*, which resulted in the present action, to which the defendant pleaded that all the statements in the letter were true, with the exception of that relating to the action of the Piscatorial Society, which had not been adopted unanimously, but "suggested by the chairman and approved by a majority." The defendant declared positively that he informed the plaintiff of the "swim" which he had selected, and also that he had baited it in preparation for the contest. The bait used had cost him £3, and had been sent from Nottingham, as the worms in that neighborhood are supposed by fishermen to possess a peculiarly fine flavor, and to be particularly agreeable to the palate of a barbel. On the Monday in question the defendant betook himself to his "swim," and there encountered Mr. Jones, who was just leaving it, when a sharp conversation ensued between them. Mr. Gant and his friend afterward fished from 9 o'clock until 3 without getting a single bite, a result which they attributed to the visits of the plaintiff to the same "swim." The plaintiff insinuated that the defendant fished from a punt, which it should seem is a serious reflection on a barbel angler, and was indignantly denied by the latter gentleman, who declared that the punt is simply taken for convenience, and in order that the fish, when caught, might be preserved alive, though it was admitted that Mr. Jardine had tried his luck from the punt. The jury rendered verdict for the plaintiff for 20 shillings, and his lordship certified for cost.

FISHING EXTRAORDINARY.—The *Burlington Hawkeye* makes scores, one on this:

All the large fish are not caught in the eastern waters. The other day Mr. Isaac O. Herron, Angler avenue, this city, was angling for the finny inhabitants of the limpid Mississippi up in Judge Simpson's fishing grounds, above Oquawka. He was fishing with a hand-line and had met only with moderate success until about 11 o'clock in the morning, when the line was seized and ran out with such violent rapidity that it set one of the wooden rowlocks, around which it had taken a turn, on fire. In his efforts to extinguish the flames and capture the fish, Mr. Herron upset the boat and was thrown into deep water. The line was tangled about one of his legs, which seriously impeded him in his efforts to regain the boat and right it. Fortunately, he managed to get hold of an oar, which assisted him in keeping his head over water. The fish meanwhile was rapidly towing him out into the river, and Mr. Herron, now thoroughly frightened, gave up all hope of securing it, and bent only on saving himself, shouted lustily for help, for he was utterly unable to break the line. His cries for help attracted the attention of some raftmen, who immediately manned a boat and started to the rescue of the unfortunate man, whose condition was now of extreme peril. The fish, however, rapidly towed its almost exhausted victim over to the Iowa shore before the raftmen could reach him, pulled him up on the bank, ran into the woods with him, climbed a tree and hauled Mr. Herron up after it, and was just on the point of cutting his throat with his dorsal fin, when the limb on which they were seated broke and precipitated them both to the ground, where the raftmen, who had just come up, killed the fish with boat hooks. It proved to be what is known as a "channel catfish," and weighed, when dressed, a pound and a half, and was nearly five inches long. Mr. Herron, although bruised and exhausted by his fright and rough handling, is not seriously injured, and is able to be about as usual.

SHEEPS HEAD FISHING.—From Little Egg Harbor Inlet up through the several channels of the bay will be found the best sheeps head fishing on the coast of South Jersey. For many years I have been an annual visitor, with varied luck. I have taken from one to eighteen of these fine fellows in a seasonable portion of a day, and have seen nearly thirteen hundred pounds from one day's catch with the ordinary hand line. This is fine sport for the amateur, and the hard working fisherman finds a ready market at fair prices for his catch. This game fishing, as at present cannot last long. During my visit in July the several channels have been swept with a seine, and hundreds of fish taken. I have been informed that \$175 was realized from a single haul. The Game Society of New Jersey could not perform a better act than to have a law passed by the legislature for their protection. These fish are not native, but annual visitors to these inlets and bays, feeding on the black mussels which are so abundant, and imparting both fat and flavor to the fish. In September or early October when they leave, they are in the finest condition.

J. G.

A SHAD QUESTION.—Crossing the Barclay street ferry from Hoboken to New York, Aug. 14th, I noticed the end of the pier at the foot of Vesey street covered with boys fishing, and on landing went around to note the result.

There were fifteen boys of all sizes and ages, showing, however, but little variation in degrees of filthiness, armed with broom-handles, short sticks and barrel-hoops in lieu of rods, while the lines were generally of cotton wrapping twice or linen thread, while the bait in each case was clam. The total catch at 11 A. M. was two shad and a bluefish. One shad measured five inches and seven-eighths and the other a trifle less. The bluefish (*Pomatomus saltatrix*) was smaller. The question that arose was, how old were these shad? Certainly very small for fourteen months, and too large and far down stream for two months.

The boys called them "shiners," and said they often caught plenty, and they ran about that size—never larger.

FRED MATHER.

PREACHING AND ITS EFFECTS.—Not long since a preacher of our acquaintance described a pond in which he had seen many fine fish, and brought it into an illustration in one of his discourses. On the following Sabbath morning six deacons were missing from their pews, but when the pastor took a stroll after service, he saw the absent six sitting on the verdant bank of that identical pond, and half a dozen corks were bobbing on the surface of that stream.—*New York Dispatch*.

MASSACHUSETTS.—Salem, Aug. 3.—Hiram Langford and his crew to-day captured a horse mackerel weighing 850 pounds.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals at Gloucester the past week has been 94—20 from the Banks, 44 from Georges and 30 from mackereling trips. The receipts of halibut have been large, 600,000 lbs. from the Banks, 14,000 lbs. from Georges, and prices have ruled low, most of the fares selling at 1½ cts. per lb. The receipts of codfish have been 1,400,000 lbs. from the Banks, 500,000 from Georges; the demand is good for the season and prices well sustained. Mackerel have been in light receipt, some 800 bbls., mostly from Block Island, and have found a ready sale at fair prices.—*Cape Ann Advertiser*, Aug. 11.

CONNECTICUT.—New Haven, Aug. 13.—Bluefish are biting well, and the sport attracts great numbers of fishermen to the wharves and docks. Charles Rosenberg is the champion at present, with a usual daily catch of nearly one hundred.

Savin Rock.—Dennis Upson, of Unionville, the other day shot a sturgeon which weighed one hundred pounds.

NEW YORK.—Kingston, Aug. 12.—On Tuesday last Geo. B. Styles, Chas. H. Styles and Edward W. Styles went fishing for black bass in the Walkkill, at Gardiner Station, W. V. Railroad, and caught twenty-two pounds of black bass, the largest of which weighed 3½ lbs. John Dufon and Ed. Lowe caught fourteen pounds of bass the same day at the same place, the largest weighing 3½ lbs.

A large catamount was shot in Mink Hollow, town of Woodstock, Ulster county, last Thursday by Albert Garrison, while attempting to carry off a pig from the pen.

OUR HARRY.

Glens Falls, N. Y.—A. N. Cheney, of Glens Falls, recently caught two of the largest Oswego bass in Long Pond ever taken in Warren County. The largest was twenty-two inches in length and weighed seven pounds and fourteen ounces. The other weighed six pounds and twelve ounces. The pond was stocked with six of these fish eleven years ago, and it is now well filled with their progeny.

Kingston, N. Y., Aug. 6.—Albert Carr went fishing in Roundout Creek last Monday, near Eddyville dam. He caught 28 pounds of catfish and bass; his largest cat weighed 3½ pounds.

Doctor Huested has just returned from a trip among the Catskills, bringing three hundred of *Salmo fontinalis*. He reports trout fishing better than before for years.

OUR HARRY.

NEW JERSEY.—Kinsley's Ashley House, Barnegat Inlet, Aug. 4.—Constant easterly storms all the week. No fishing worth reporting, except to-day. O. H. Scott, Philadelphia, 29 black and sea bass. Col. W. Evans, Holmsburg, Pa., 37 ditto. They are running good size.

Wagner House, Budd's Lake.—Seeing an account in your last number of a 5½ lb. black bass, taken at Greenwood Lake, I am desirous to place on record the fact that on the 19th of July I hooked and landed a black bass 23 inches in length, 17 inches round the body and weighing 6½ lbs. From July 10th to 31st I took from this lake 24 black bass, weighing 56½ lbs. Mr. Allen, the veteran fisherman of this lake, has taken 40, and Mr. Charles Wagner has secured 12. For a small lake, fished to death in the winter and netted in the spring (as I am credibly informed), the fishing is excellent. When the bass are not "in the humor," there are plenty of pickerel and very large yellow perch. By the way, I struck a pickerel to-day with one of Marster's "Dobsons." The weights given are actual, not guessed at.

A. S. C.

Weakfishing and sheepsheading are the piscatorial attractions of Barnegat Bay just now.

PENNSYLVANIA.—Maple Lodge, Pike County, August 4.—While trolling for bass in Jones Lake, on Saturday last, I saw quite a commotion in the water close along shore, and pulled the boat up for an inspection, when I found quite a large water snake had attempted to swallow a good sized catfish, and had proceeded as far in the process of absorption as the fish's horns, which, projecting on each side a distance of two inches, had effectually prevented the total engulphment of the "cattie." The fish was endeavoring to free itself, and the snake was making frantic efforts to escape. What the result would have been had I not put in an appearance and killed both, I could not say. Bass fishing has been excellent; during the month of July I took with the fly some forty, ranging from one to four pounds, and think they will rise to fly even better during this month (August). On the 19th of July I tried the trout on Dimon's Brook, and took fourteen very fine ones, the largest weighing one and three-quarters pounds, the whole crew scaling a little over nine pounds.

—The editor of the Bucks County (Pa.) *Gazette* says that it has been discovered that the jointed fishing pole was invented because one can't hide a long pole under his coat Sundays. He ought to know.

—There is good black bass fishing near Leek Run and Shawsville.

ILLINOIS.—Rock Island, Aug. 10.—The warm weather of this season has driven many families from their hot, dusty homes in the city to a more pleasant abode on some of the islands in Rock River. At Milan, three miles south of this city, are a number of small islands, which furnish a most delightful camping ground, and the tents that dot them here and there show that many persons appreciate the cool, refreshing breeze and beautiful lawns that are offered. Various kinds of fish are quite plenty in the stream and can be purchased at the markets at the following prices: eels, 25 cents per pound; salmon, 15 cents; pike, bass, striped bass, croppies, sunfish, 12½ cents; perch, catfish, 10 cents; buffalo, 8 cents; suckers, bluefish, carp, sturgeon, 8 cents. Turtles are plenty at 12½ cents. The above prices are for fish dressed. They are sold from the nets, at from 3 to 5 cents less per pound.

D. B. K.

MICHIGAN.—Detroit, Aug. 11.—Gaff Stenton, of this city, took a trip to St. Clair Flats on the 6th inst., and made a string of 65 black bass. Bogardus, of Ypsilanti, was at the same place on the 6th inst., and made a string of 24 black bass and 2 pickerel. The pickerel weigh 10 pounds each. Albert Hill and E. W. Reynolds took a trip down the river to Fighting Island for a day's fishing on the 10th inst., and made a string of 20 black bass and 11 pike; one bass weighed 6½ pounds, and one of the pike weighed 8 pounds. Eugene Robinson, Jesse E. Saxton, Wm. Livingston and A. Downey returned Aug. 4 from a three days' sport with rod and line with 758 pounds of fish; the collection comprised black bass, rock bass, maskelonge, etc. Messrs Hale, of Chicago, Ill.; Hastings, of New York; Smith, Brow, McPherson and Rogers, of this city, returned Aug. 7th from a three days' fishing cruise at St. Clair Flats, with 158 fish, black bass, rock bass, etc.

ROVER.

—H. T. Phillips, E. W. Reynolds and Joseph Baker were out on a fishing excursion, and made a string of 13 black bass, 7 pike and nearly a wagon-load of perch, etc.

ROVER.

MISSOURI.—Cape Girardeau, Aug. 5.—You in the East have the advantage of us out West in fishing—that is, trout and bass fishing—but when it comes to catfish we discount you. We often catch cats weighing from 50 to 150 pounds. A few years ago I was on a visit to some friends in Mercer county, Ill. There was a small stream close by called Edwards River, but in reality nothing more than a small creek, in which were some very deep holes, and abundantly supplied with the finny tribe, mostly sunfish and yellow bass. Our bait was angle-worms, and after capturing a goodly number, I noticed my cork suddenly disappearing, and on landing my prize, found three fish on one hook—first a sunfish, who had swallowed the hook, then a bass that had gobbled the sunfish, and last a pike who had stuck its jaws into the bass. It's a tough story, but it is a fact, nevertheless.

J. B. C.

WISCONSIN.—Ashland, Aug. 4.—Capt. T. J. Falls, of your city, who has been to the upper waters of the White River on a fishing trip, reports the fish there abundant and very gamey. Large party off for the Nepona River to-day. They go as guests of John O'Malley, and are to be absent ten days.

M.

CALIFORNIA.—Last week, Allen L. Luce, of Monterey, in company with Charlie Wornes, fishing in the headwaters of the Little Sur, caught 428 trout in three hours, 100 of the fish being over ten inches long.—*Pacific Life*, July 28.

FLORIDA.—New Smyrna, Aug. 11.—Bass and grouper in abundance at the Inlet. A steamer from this port to Fernandina, via St. Augustine, is to be put on the line in November.

G. J. A.

PRINCE EDWARDS ISLAND.—Summerside, Aug. 6.—Mackerel fishing is now going on vigorously in the Bay quite near this delightful seaside hotel, and full baskets of trout are taken every day in Dunk's River, a few miles distant. These sports, coupled with plover shooting, fine sea bathing, and the bright smiles of the "summerside belles," make old time pass away pleasantly. No blues here.

STANSTEAD.

## SPLIT BAMBOO RODS.

To Our Customers and the Public: In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
—[Add.], Manufacturers, 65 Fulton Street, N. Y.

HOW HE MARRIED.—A clergyman, a widower, recently created quite a sensation in his household, which consisted of seven grown-up daughters. The reverend gentleman was absent from home for a number of days, visiting in an adjoining county. The daughters received a letter from their father, which stated that he "had married a widow with six sprightly children," and that he might be expected home at a certain time. The effect of that news was a shock to the happy family. The girls, noted for their meekness and amiable temperaments, seemed another set of beings; there were weeping and wailing and tearing of hair, and all manner of naughty things said. The tidy home was neglected, and when the day of arrival came, the house was anything but inviting. At last the Rev. Mr. X— came, but he was alone. He greeted his daughters as usual, and as he viewed the neglected apartments, there was a merry twinkle in his eye. The daughters were nervous and evidently anxious. At last the eldest daughter mustered courage, and said: "Where is our mother?"

"In heaven," said the good man.

"But where is the widow with six children whom you wrote you had married?"

"Why, I married her to another man, my dears," he replied, delighted at the success of his joke.—*Detroit Post*.

A MODEL PUNCH BOWL.—At a banquet given in Ishpeming Michigan, recently, there was a huge punch-bowl on one of the tables, four feet in diameter and three feet high, carved out of ice. Although the weather was very warm, it lasted the evening through.

Yachting and Boating.

HIGH WATER FOR THE WEEK.

| Date.    | Boston.    | New York.  | Charleston. |
|----------|------------|------------|-------------|
| Aug. 17. | H. M. 5 00 | H. M. 2 30 | H. M. 1 50  |

BOAT AND YACHT BUILDING.—*Errata.*—First paper, first column, 24th line, for "level," read "bevel;" 26th line, read "Next saw the side-boards to the length determined on for boat." 52d line, for "sawbenders," "sawbenches." Commencing at the middle of the 16th line from the bottom, read, "Cut a strip one inch deep, and sufficiently long to allow for the width of platform out of the top edge of side-boards of boat."

Second paper, first column, 18th line, for "level" read "bevel." Place a period after the word bevel, and read: "At the bow, the sideboards can be sawed to the same bevel, or, the stem can be left straight." On lines 28, 32, 33, 35, 36, 45, 48, 51, 55, and 61, for "stern," read "stem." 61st line, for "in," read "on." On the 5th line from bottom, after the word "desired," read, "At whatever width you want it, fit a board crosswise the boat, 4 or 5 inches below the gunwale."

On the 9th line from top of second column, for "stern," read "stem." This last error is the funniest imaginable; a "double sterned" boat being the "sternest" joke of the season. Indeed, the whole of the second paper abounds in "sternness," and I hasten to correct, for fear it may give some one the brain fever in trying to comprehend it. NAUTICS.

NEW ROWING ASSOCIATION.—The election of Detroit as the point for holding the National Rowing Association Regatta, this year, has determined the withdrawal from that Association of a large number of Eastern clubs. It is proposed to organize a new association comprising not less than fifty well-known clubs, among which are those of the Hudson, Harlem, Kills, Passaic and other streams, and probably the Schuylkill Navy of Philadelphia. A meeting of representatives from the different aquatic associations is to be held this evening at the Fifth Avenue Hotel, for organization. It is proposed to hold an annual regatta on the waters in the vicinity of New York. Such a project is eminently worthy of support, and will doubtless meet with very general satisfaction. We bespeak for the new association all success.

FAST TIME THROUGH A FLUME.—A correspondent of the Philadelphia *Herald* sends an account of the perilous journey down the mountains of two Nevada miners, who made the trip in a mining-flume. The flume is owned by Messrs. Mackey & Fair, and is located in the mountains, near Carson City. It is about fifteen miles in length, leading from a lofty elevation down to the plain, and crossing in its course deep ravines, skirting terrible precipices and chasms, and presenting many sharp curves. It is fed with water from Lake Tahoe, and empties into a creek near Carson City. This flume, said to be the longest in the world, is used to carry down timber which is cut on the mountains. There are several places in its course where the incline is slight, and visitors are occasionally treated to a short trip over these inclines in a boat constructed for that purpose. The two men who took the trip were workmen, who some months ago conceived the notion of shooting down the entire length of the flume. To carry out this foolhardy adventure, they constructed a strong boat, sharp at the bow and square at the stern, and fitting the flume closely enough to keep it steady. The men describe the trip as something terrific. The heavy boat got a fearful headway, and the men had no means of stopping it. In shooting round the curves they thought it would jump the flume and precipitate them into the chasm that yawned beneath. Down the steeper inclines the boat sped with more than express-train velocity. The fifteen miles were passed in less than eleven minutes! From the foot of the mountain to where the flume empties the incline is gentle, and here the boat gradually lost its terrific headway, and at length glided smoothly into the creek. Unharmful, but scared almost out of their senses, the men stepped ashore, and one of them was heard to remark that he would not make that trip again for all the silver and gold in Nevada.

NEW YORK YACHT CLUB.—The following boats of this club started on the annual cruise last Thursday: Schooners Restless, Wanderer, Dreadnaught, Columbia, Rambler, Estelle, Tidal Wave, Madeleine, Nettie, Idler, Clio, Tempest and Nereid, Vesta and Olytic; and the sloops Vision, Vixen, Windward, Volante and Active.

MASSACHUSETTS.—*Saumpscott, Aug. 11.*—The Union Regatta under the auspices of the Beverly Yacht Club, which had been long postponed, was sailed under most favorable circumstances, as above, at noon. The race was open to all yachts under forty feet; the competing boats being divided as follows: The first-class included those yachts measuring 29 feet water line and over; those measuring over 21 feet and under 29 formed the second-class; those measuring over 17 feet and not over 21 formed the third-class, and those not measuring over 17 feet formed the fourth-class. The course for Nos. 1 and 2 was 14 miles; for Nos. 3 and 4 about 7 miles. The first prizes were: First-class, bronze clock; second-class, silver cake dish; third-class, silver goblet; fourth-class silver flask. The second prize in first-class was a silver vase; in second-class, pair of napkin rings; third-class, silver pepper box; fourth-class, silver bell. The prizes for the special class have not yet been selected, but will consist of solid silver. The following is a summary:

| FIRST CLASS.             |                  |                  |             |                  |                  |

—The race between Hosmer and Driscoll, on the Charles River, was awarded by the referee to Hosmer; Driscoll broke an oar at the seventh stroke.

LAKEMAN BOAT CLUB.—*Boston, Aug. 2.*—The annual regatta of this club was rowed over a course from Commercial wharf around Buoy 11 and return. The prize, a set of silver goblets, was won by the Hennessy crew.

—A single scull race for \$100 a side, between Geo. Hosmer, of Boston, and J. E. Brown, of Worcester, was rowed on Lake Quinsigamond, Worcester, Mass., August 2. Won by Hosmer by about twelve lengths. Distance, three miles, with a turn; time about 32m. 11s.

NADARSET YACHT CLUB.—The second regatta of this club was sailed off Nahant, Mass., Saturday, Aug. 4. The courses were: Second and third classes, seven miles each; fourth class, three miles. The prizes were: First class, silver bowl; second class, silver goblet; third class, silver punch ladle; fourth class, silver cheese knife. A second prize of a silver cup given classes where more than two yachts started. Following is the result:

| SECOND CLASS. |            |       |            |
|---------------|------------|-------|------------|
| Name.         | Cor. Time. | Name. | Cor. Time. |
| Pearl.        | 1 43 46    | Idis. | 1 54 21    |
| Water Lily.   | 1 52 12    |       |            |

| THIRD CLASS. |            |         |            |
|--------------|------------|---------|------------|
| Name.        | Cor. Time. | Name.   | Cor. Time. |
| Bessie.      | 1 28 47    | Nora.   | 2 08 26    |
| Rose.        | 1 51 42    | Curlew. | Not taken. |
| Avis.        | 1 53 43    | Edith.  |            |

NEWPORT YACHT CLUB.—*Newport, Aug. 8.*—Handicap race: Distance, 17 miles, silver prize; presented by S. F. Pratt, of Boston:

The following is the time of the start and arrival:

| Started.  |          |          |          |
|-----------|----------|----------|----------|
| Name.     | H. M. S. | H. M. S. | H. M. S. |
| Lillian.  | 11 50 00 |          | 3 15 00  |
| Bove.     | 12 13 18 |          | 3 17 00  |
| Dart.     | 11 25 00 |          | 2 51 25  |
| Fidget.   | 11 26 00 |          | 2 48 01  |
| Wanderer. | 11 30 33 |          | 2 49 01  |

The Dart therefore won by a minute, although the Fidget went over the course in 1m. 38s. less than she did.

V.A.—*Norfolk.*—On the 4th inst. we had an extremely interesting cat-boat race in Hampton Roads, for possession of a handsome cup presented by H. Phoebe, proprietor of the Hygeia Hotel, at Old Point Comfort. I hand herewith the official record of the event, showing twelve entries. The course was from Old Point wharf to a point five miles dead to the leeward and return, the stake-boat being placed about a mile above Sewell's Point:

|               | Actual<br>Time. | Corr.<br>H. M. S. |            | Actual<br>Time. | Corr.<br>H. M. S. |

It is more than probable that a series of matches will be sailed by the Little Fraud and other boats. BREAKWATER.

—Gen. B. F. Butler, with his famous yacht America, is cruising on the Canadian waters.

—David Carl, of City Island, is building for Mr. William Astor a schooner yacht, which is to cost \$250,000.

—One of the Indian canoes at Mt. Desert, Me., this summer, has been puzzling the guests by the mystic legend inscribed on its prow, "Pas de l'eu Rhone que nous." The plain English of this is "Paddle your own canoe."

—The second single-scull handicap race of the Palisade Boat Club, Yonkers, N. Y., was rowed Aug. 6. The entries were S. J. Lee, 105, R. G. Jackson and A. Moffat, scratch. Won by Lee in 10m. 25s.

—John Morrissey has offered a purse of \$500 for a scull race to take place on Saratoga Lake, Aug. 28. The conditions are: Distance, three miles, with a turn; open to all; entrance fee, \$100, to be added to stake, and all to go to the winner. National Association rules to govern. This will doubtless bring Courtney and Riley together again, and also offers opportunity for a score of scullers, whose relative merits the public would be pleased to have tested.

PALISADE BOAT CLUB.—The second handicap single-scull race of the series for the gold medal, came off at Yonkers, August 6. Distance, one and three-quarters miles. The entries were S. S. Lee, ten seconds; R. G. Jackson and A. Moffat, scratch. Lee won in 10m. 21s.

—The annual regatta of the Palisade Boat Club takes place to-morrow afternoon.

HALIFAX, N. S., Aug. 7.—The scull race for the championship of Halifax Harbor was won by Warren Smith, his only opponent being John Nicholson.

National Pastimes.

CRICKET.

COLUMBIA VS. MANHATTAN.—Prospect Park, Brooklyn, Aug. 10.—The scores were as follows:

| COLUMBIA.                    |    |                                 |   |
|------------------------------|----|---------------------------------|---|
| First Inning.                |    | Second Inning.                  |   |
| Cuddihy, b Tucker.           | 0  | b Love.                         | 0 |
| McCluskey, b Tucker.         | 0  | c Carey, b O'Toole.             | 0 |
| Gregory, b Tucker.           | 0  | run out.                        | 0 |
| O'Sullivan, c & b Love.      | 0  | b Love.                         | 0 |
| Atkinson, b Love.            | 2  | b Scott.                        | 1 |
| Brown, c Stevens, b Love.    | 4  | c Mad b Love.                   | 1 |
| Muntura, b Love.             | 4  | b Tucker.                       | 1 |
| Carey, c McDougall, b Scott. | 4  | run out.                        | 0 |
| O'Toole, not out.            | 1  | b Love.                         | 0 |
| Ponsch, b Scott.             | 0  | c and b Scott.                  | 0 |
| Mooney, b Scott.             | 0  | not out.                        | 0 |
| Byes, 10; leg-by, 1.         | 11 | Byes, 6; leg-byes, 5; wides, 3. | 5 |
| Total.                       | 52 | Total.                          | 5 |

| MANHATTAN.                                |    |                         |    |
|---|----|-------------------------|----|
| First Inning.                             |    | Second Inning.          |    |
| Love, b Gregory.                          | 5  | b McCluskey.            | 4  |
| Jones, run out.                           | 15 | b McCluskey, b O'Toole. | 0  |
| Jep, c and b Gregory.                     | 0  | b Brown, b O'Toole.     | 0  |
| H. Tucker, c O'Sullivan, b Greg.          | 0  | not out.                | 0  |
| McDougall, c Cuddihy, b O'Toole.          | 4  | c McCluskey, b O'Toole. | 0  |
| McKewin, b O'Toole.                       | 0  | b O'Toole.              | 0  |
| Bareilly, b O'Toole.                      | 0  | b McCluskey.            | 0  |

GALT VS. HARTSVILLE AND BERLIN.—Galt, Canada, Aug. 2.—Won by Galt, by 1 inning and 23 runs.

PARIS VS. BEAVER.—Norwich, Ont., Aug. 6.—The game resulted in a tie.

SCOTTISH-AMERICAN ATHLETIC SPORTS.—New York, Aug. 11.—The second series of handicap games, held at club grounds. Prizes, silver medals. Summary:

Four hundred and forty-yards run in heats—First heat won by E. C. Smith in 58s., with 50 yds. handicap; second heat won by T. H. Smith in 61s., with 30 yds. handicap; third heat won by H. B. Wilson in 58s., with 35 yds. handicap; final heat won by Smith—won in 59s.

Vauling with pole—J. B. Hanna won on 7 ft. 10 in., with handicap of 13 in.

Three-mile walk—Seven entries; won by J. V. Woolcott in 26m. 11s., with 40s. handicap.

BOSTON, Aug. 7.—A foot race of 150 yards, between James Dwyer, of Boston, and Charles Drape, of Northboro, for \$300, resulted in a victory for Dwyer, who won by about three feet. Time, 15½s.

A LITTLE GIRL'S BIG SWIM.—Libbie Grant, a little girl eight years old, swam, on Aug. 2, from Ward's Island dock across the Harlem River to the bath house at the foot of 114th street, N. Y. City., a distance, making allowance for the current taken, of about three-quarters of a mile. The first was accomplished in just fifteen minutes, and Libbie clambered up into the boat house amid the plaudits of several hundred men, women and children.

GLASS BALL TRAPS.—In your last issue I notice several reports of glass ball shoots throughout the country, and am pleased to see that the Republic and Attie Clubs, at Attica, O., made good scores shooting from my traps and rules, breaking 15 per cent. of the balls shot at. I consider No. 1 shooting. Also a match at Fitchburg, Mass.; one man broke ten balls straight at thirty yards. It could not have been from my traps and with my rules. I (and I think the rest of you readers) would like when a match is shot to know what traps were used and according to what rules, then the sporting fraternity could better judge how good shots they were. I attended a match at New Haven, Conn., on the 11th inst., and quite a number of local shots participated, a large majority of whom had been practicing from Marshall's & Purdy's traps, breaking 45 to 48 out of 50. In the first sweep, nine entries, five balls each, from three traps, according to rule, fifteen balls were broken out of 48, one man who had practiced from my traps breaking 5 straight. Second sweep, ten entries, five balls each, one trap, one-half broken. All parties were satisfied they were getting good practice, and had shooting, and purchased a set of traps.

X. B.—New York, Aug. 13, 1871.—To Managers of Shooting Clubs and State and County Fair Associations: I am prepared to make engagements to shoot exhibition matches at shooting tournaments or fairs, to break 300 glass balls in thirty consecutive minutes, or 500 in fifty minutes, ball to be sprung from my pat. glass ball trap in any exhibition match. I will bet \$200 to \$100, or \$1,000 to \$500 that no man in the world can do what I can. Terms \$500 to \$1,000, according to distance to travel. Letters addressed to Eikhart, Ill., will be forwarded, if not at home. (Ld.) A. H. BOGARDES.

## Answers to Correspondents.

## No Notice Taken of Anonymous Communications.

DAUPHIN, Dauphin Co., Pa.—A typographical error.

E. W. B., Cleveland, Ohio.—Will a .32 cal. long cartridge, explosive bullet, kill a gator? Ans. Yes, if aimed properly.

JONES, Hornellsville.—There have been several rose-tinted grosbeaks shot here lately. Are they not a rare bird in this vicinity? Ans. Yes.

OUR HARRY, Kingston.—Send us your name and address, if you desire us to publish your items. We do not accept anonymous communications.

E. J. R., Wethersfield.—Ans. You should know that it would be highly improper for us to make a distinction of any one's wares, unless they were absolutely valueless.

J. M. D., Irwin Station, Pa.—Is the Pigeon Starter or Mechanical Cat a good article for what it is recommended? Ans. It is said to answer an excellent purpose.

O. T. T., Millbrook, N. Y.—Please notice the questions at the head of the Kennel column, and govern yourself accordingly. Your description is too meagre to judge from.

MARKS, Wankegan, Ill.—Ans. We answered the question correctly. We care not what Chicago may do; right is right. *Class* shooting is one thing and shooting another. See answer to D. in this column.

J. BISHOP, Petrolia, Pa.—Please inform me where I can procure "Thornburn on Mushrooms," referred to in your paper of recent date. I have tried to get it and have failed. Ans. Through Estes & Lauriat, of Boston.

J. H. O., Columbia, S. C.—Please inform me as to the length of the spikes in Von Culm's collar? Want to try it on a young pointer; also, if said spikes are very sharp? Ans. You can have a collar made with any length of spike, and as sharp as you choose.

J. A. B.—We have nothing to do with the pedigree list, and shall not probably publish another. We have repeatedly stated in these columns that the matter of registration is now in the hands of L. E. Smith, Strathroy, Ontario.

GEO. A. E., North Brookfield, Mass.—Do you think that a glass-ball trap could be made to feed itself, and be reset at the owner's stand? Ans. We have no doubt but that Yankee ingenuity will fill the bill, if it there proves to be sufficient money in it.

M., New Haven.—Do you recommend the artificial bloomer, Dobson, alligator, scorpion crab, hooker, holgrammille, crawler, or whatever you call it, for black bass bait? It will be received gratefully by fishermen, if it will do as well as the natural one. Ans. The proof of the pudding is in the eating. Try it.

W. P., Madison, N. J.—Can you inform me of some small place in Maryland on the Bay where good quail-shooting can be had, and also ducks, and the name of a resident to whom I could write. Ans. Go to S. Suttons, Perrymanville, Magnolia Co. The "Sportsman's Gazetteer" would give you all this information. For good quail-shooting go to Frederick.

ANTLER, South Bend, Ark.—Which of the following named rifles would be preferable for hunting, Winchester repeating, or Sharps sporting rifle? Ans. We have repeatedly stated through these columns that we cannot discriminate between manufacturers. We cannot give the address you desire.

R. T. C. S., Cardville, Pa.—Where can I find good bear and deer hunting the nearest point from Pittsburgh, and the best time to go? Ans. October is a good time to go, and the Hely Wilderness and the Blackwater region, in West Virginia, is a good objective point. See Hallock's "Sportsman's Gazetteer."

D. W., Portland, Me.—Will you please inform me what "Stuart's tackle" is? Is it better for bait fishing for trout than single hook? Of what size hooks is the tackle made? Ans. We do not know the article. The oldest dealer in the city never heard of it. Have you not made a mistake?

C. JOLLY, Phila.—1. Please inform me what kind of fishing is to be had at Butterton? 2. Also what a boat to accommodate two would cost for a couple of days? 3. And will Bay bird shooting be good there the latter end of this month? Ans. 1. Butterton is a great place for deep sea perch fishing. Dipsyes are used. 2. Man and boat will cost about \$5 per day. 3. Probably in that neighborhood.

D. M., St. Dennis P. O., Md.—1. Please inform me if I am late to obtain one of those \$5 rifles advertised in your July 5th number. 2. Are they tolerably accurate? 3. Is there no danger of their bursting? 4. If I cannot obtain one of them, where can I obtain a good, cheap, muzzle-loading rifle, and for what? Ans. We do not recommend the \$5 rifle. 2. It is the old Star carbine. 3. Take your chances. 4. At any reliable gun store.

E. S. S., Goshen.—In a sweepstake shoot A shoots 10 balls, B 9, C 9, and D 8. They don't shoot off, but divide the money—three prizes. How is the money divided? Ans. A takes first money, B and C take second and third. Except in class shooting the highest scores win; in the latter case D would take third money, and B and C divide second.

C. O. A., Woonsocket R. I.—I have a setter dog one year old. He has been sick with the distemper; has got about over it; looks and eats well, but can hardly walk. Can you tell me what to do for him, or shall I have to kill him? Ans. Give ½ teaspoonful doses of Caswell, Hazard & Co.'s elixir of calasaya, iron and strychnine every four hours and feed well.

E. B. B., Hudson, Ohio.—Will you please give me the amount of area nut for a puppy seven weeks old? I have the powders, but am afraid to give them. Ans. It would be highly improper to use it at all, least of all with young puppies, as it acts by creating a violent inflammation of the bowels; moreover, there is little likelihood that animals of that age need anything of the kind.

READER, Auburn, N. Y.—Will you please inform the sporting men of this vicinity whether a woodcock can be scared to death or not? The other day while out shooting with a friend who put up a cock and fired at it and the bird fell dead. Upon a careful examination we could not find a mark on it although we plucked every feather from it. The bird was in good condition and an old one. Ans. The bird was killed by the "wind" of the shot probably.

ADIRONDACKS, U. S. Treasury, New York.—1. Is the trout fishing in the Adirondacks Lakes good at present time? 2. What lakes would you recommend as the best water for the above fishing? 3. Which is the best way of getting there? 4. What is the charge per day for board, and how much for guide? 5. What is the expense of getting there? 6. Do the trout take the fly at present? Ans. 1. Yes. 2. There are plenty of good lakes; we have not space to describe the different points or modes of getting there. 4. The average per day is \$2 for board and \$3 for guides. 5. The expense varies with the region you desire to enter. 6. Yes.

O. H. M., Greenpoint, N. Y.—The information you desire regarding dogs will be found in Hallock's "Sportsman's Gazetteer." Price \$3, for sale at this office. 2. Oh, ask the young lady for her company by all means, and out the other fellow out, if you are able.

A. M. C., Detroit, Mich.—The new dog-tax law of Michigan provides for a tax of \$1 on each male dog over six months old, and \$3 on each female dog. No action under the law can be taken this year, however, as it has no force until the 1st of August, and as it requires the assessors of every township to make out a list of dogs for taxation on or before May 15 of each year.

GEO. MCCO, New York.—A party of four gentlemen desire to go up in Pike County, Pa., in September, to camp out; would like to locate near some lake, where we can have hunting and fishing. Can you advise us where to go? Ans. Write to J. A. Williamson, Lackawanna, Pike County, Pa., and he will pick out a camping ground for you. The "Sportsman's Gazetteer" will give you all other information.

SCALES, Niantic, Conn.—Can you inform me if a law has been passed in this State, prohibiting the catching of trout for the next three years? I have been informed that such is the case. Is there any law regulating the setting of nets along the harbors? If not, there certainly ought to be, for the fishing is almost spoiled by them. Ans. The law you mention refers to "salmon or grise, or fry thereof." Brook trout may be taken from the 15th of April to the 1st of July only. 2. We regret to say there is not.

A. W. T., Orangeville, Ohio.—We have a small stream here called Pyramating that has a great many black bass. Can see hushies of them when the water is low. Have tried ever since the first of July to take some of them with minnows, artificial flies, soft shell crabs, also with red dannel after night, but in vain. They all fail. If you can prescribe a medicine for them you will convey a great favor upon your humble servant. Ans. Try the Dobson bait.

D. R. C., North East, Pa.—What is your opinion as to the profitability of herding in Western Texas with a moderate capital of say \$5,000 to \$10,000, as compared with the same amount of capital invested in say ordinary farming in Illinois or Kansas? Ans. The money properly invested in cattle should return a good dividend, as it should also invested in a good farm in Kansas, "barren" the grasshoppers. Many in both Texas and Kansas herd cattle, as well as carry on farming.

REX, Washington, D. C.—Will you please give me a receipt for mange in a dog? I have a very fine pointer that has had it for about seven months. Ans. The word *mange* covers "a multitude of sins," being applied indiscriminately to some forty or fifty diseases of the skin to which dogs are liable. Describe symptoms, appearances, etc., as given in the note at the head of the Kennel column, and we will prescribe.

E. P. E., Cincinnati.—I have a pointer dog which I keep in the city; he necessarily becomes very dirty from the soot which collects on him. I desire to ask you if it would do him any harm to have him washed once or twice a week? If you think it would not do him any damage what kind of soap would you recommend, also warm or cold water? Ans. Wash him by all means; if every day all the better, using tepid water and Castile soap. Give him a race after drying him well with a cloth.

SHEDDERS, LYNN.—1. Can a muzzle-loading gun be bored so as to shoot close at say 40 yards. 2. If bored will it not want a larger wad than before? 3. Would it reduce the strength of the barrels? 4. Where is a good place in Boston to have it done, and what would you estimate the cost? Ans. 1. Yes. 2. Yes, slightly. 3. Necessarily it would somewhat. 4. Wm. R. Schaeffer, of Elm St., or Wm. Read & Sons, 13 Faneuil Hall Square.

D., Buffalo, N. Y.—A, B, C and D get up a shoot at 5 birds each, class shooting; \$1 entrance; five per cent. to first, thirty per cent. to second, twenty per cent. to third. A, B and C each kill four. D kills one. A, B and C shoot off at three each; A and B kill three; C kills two. A and B shoot off again. A kills three; B two. How is the money to be divided? Ans. A takes first money; D second. There is no third class.

JOHN V. B., Dresden.—I see through your paper that some of your correspondents mentioned the name of the Gascon hound. If you know anything of the qualities of the dog I wish you would be so kind as to give me some information of his superior traits. Do you think he would make a good fox dog? Ans. The Gascon hounds are used almost exclusively for wolf-hunting. They would not make good fox dogs.

W., Peekskill, N. Y.—My setter bitch has the mange slightly, showing itself in patches on the point of the elbow and on the outside of the forelegs; has been so several weeks. What shall I give her that will not injure her puppies as she has a litter about a week old. Ans. Use Juniper Tar Soap (Hazard & Caswell's) to wash the animal with, and apply Black wash at night, with ½ dr. of Fluid Extract of Conium has been added to every half pint of wash. Give internally 3 drops of Donovan's solution, three times a day in water.

A. H. S., Marshall, Tex.—I wish to get one of Von Culm's spike collars. Please advise me through your answers to Correspondents as to whether they can be had in St. Louis, or anywhere nearer than the place of manufacture—whether they can be sent by mail, and oblige? Ans. They can be sent by mail, and are best procured of Von C. You mistake; we did not consider it good enough for Western sportsmen, but that it would fill the bill for a certain class.

CHINGHUGHOK, North Manchester.—Will you be kind enough to give me your authority for your decision in answer to correspondent C. M., Goshen, in FOREST AND STREAM of Aug. 2, 1877, in regard to shooting off ties? It has always been customary, in all matches in this section, that those beaten in shooting off ties "to step down and out" and let the next highest score come in for the prize, otherwise second rate shooters would have no show in matches. Ans. Bogardus is authority for one. The highest score always wins, except in class shooting. In class shooting D would take third money.

PLUVIER, Boston.—How often should the locks of a shot gun be examined, if used two weeks at the sea-shore, and occasionally the rest of the year? 2. If a good idea, what substance is best to put round the rim of a lock to keep out moisture? 3. Is it inadvisable to wipe out the barrels and cartridge-chambers with flour of emery, woodashes, etc., to remove discoloration? Ans. With proper care the locks need not be examined oftener than once a year, yet no harm will result from the inspection if they are removed in a careful manner. 2. Equal parts of Copal varnish and pure rubber gum dissolved in naphtha. 3. Kerosene oil is better than either.

O. H., Bay Ridge, L. I.—Can partridge be shot in September in Berkshire Co., Mass., lawfully? What kind of tackle shall I take for pike fishing in a reservoir in Cheshire, Berkshire Co., and what tackle for trout (flies or live bait)? Can I expect much sport in either hunting or fishing in this region? Ans. Ruffed grouse (partridge) may be lawfully killed after Sept. 1 in the region designated. Quail can only be hunted after Nov. 1. Trout cannot be killed after Oct. 1. 2. Trolling tackle will be best for pike. Frog, minnow or pork bait may be used. 3. For trout, either worms or live bait may be used. 4. You will probably meet with fair success.

C. G. G., Boston.—Ans. Good fishing and shooting may be had at Rangeley Lakes in Maine. Also at Parmachenee Lake at the head waters of Magalloway River. A correspondent writes that the streams are full of fish, trout having been caught that weighed ten pounds.

Deer, wild geese, ducks, partridges and quail are found in plenty. Full information may be had from Edward R. Lyon, of Bethel, Conn. H. L. Leonard, of Bangor, Me., can inform you regarding the present condition of the Kesigouiche. All hunting implements, etc., can be taken into Canada without duty, if they are to be again returned to the States at the end of the trip. Particulars may be had and blank forms necessary at the U. S. Custom House, Boston.

GEO. W. KELLY, Providence, R. I.—Will you inform me of the changes in the game laws of Massachusetts? Ans. Woodcock or ruffed grouse can only be killed from the 1st of September to the 1st of January; quail from Nov. 1 to Jan. 1; ducks from Sept. 1 to April 15; upland plover, from July 15 to Jan. 1; deer, from Oct. 1 to Dec. 1; squirrels and jacks, from Oct. 1 to Mar. 1. Traps, snares, nets, springs, batteries, swivel or pivot guns, etc., not allowed. Trout and land-locked salmon or lake trout may be taken by hook and line (but by no other means) between the 1st of April and the 1st of October each year. Black bass may be taken by hook and line (but by no other device) between the 1st of June and the 1st day of December following.

BUNOWD, Fox Lake, Wis.—1. What extra charges must a man pay for bringing a sporting dog from Edinburgh, Scotland, to Milwaukee, Wisconsin? 2. What is the address of the most reliable breeder of setters in England or Scotland? 3. Which breed is preferable, Gordon setters, or Red Irish, for breeding purposes? Ans. From Liverpool including Custom House fees, butcher's bill and brokerage, it will cost from \$25 to \$30. If more than one dog is imported, the butcher's bill and brokerage will be less. From Glasgow the fees would probably be much the same. 2. We cannot give you the address of the most reliable breeder; there are plenty of breeders that are reliable, however. 3. Both breeds have their friends, but usually the Gordon is preferred for retrieving purposes, though the Irishman is as good when thoroughly broken.

GEO. S. MINER, Albany, N. Y.—Myself and friends anticipate going to the Lake Superior region some time next month for the purpose of fishing and hunting. Can you give us any information as to the best route, and about the expense, and what kind of fish and game? Ans. Go to Detroit, or Port Huron by rail, thence by Steamer to Ashland and Bayfield. Good fishing for speckled trout, and in the lake may be had salmon trout, black bass, etc. Ruffed, spruce and sharp-tailed grouse with the northern hare constitute the bulk of the game, though deer and bear may be found with labor. On the North Shore may be found the same game except Virginia deer, and by penetrating the forests, Moose, Caribou and Ptarmigan are found. Brook trout in season are found on both shores. To go to North Shore, take boat at Windsor, or Port Sarnia, Ontario, Dominion line. Fare per boat about \$15 each way, or \$30 per round trip. Average hotel expenses \$2 per day. You can take boat at Buffalo for South Shore if you choose, or go to Toronto and Collingwood and get boat to North Shore.

K. G. L.—I have a very fine setter dog seventeen months old. Four months ago took the distemper and was very bad. I succeeded in curing him, but left him very poor, with a twitching or jerking of left hind leg; he did not gain any in flesh; fed him on beef tea, bread and milk, oat meal, boiled rice, etc.; discovered he was bad with worms; used coppers and wood ashes, salinoline, etc., with no effect; sent for powdered areca nut, advertised in your columns; first dose he passed four worms about eight inches long, one-half of each seemed to be in joints, large in middle and tapered to each end. The second dose given, I gave him two ounces of castor oil, and neither the areca nut nor oil seemed to have any effect on him; he is still poor and with a continuous twitching of leg. Appetite pretty good; eyes inflamed and spirits good; nose apparently all right; hunts well; finds and stands a woodcock like an old dog; keep him in a large, well-aired and clean stable. Please tell me what to do for him? Ans. Should think that the dog has tape worm. Give him Kosoon, 10 to 15 grains, as recommended in Hallock's Gazetteer.

ERINS, Newark, N. J.—1. Where can I see a complete file of *Spirit of the Times*, or any back numbers, say from 1858 to 1850? The files in the office of the *Spirit* have been lost. Would the Mercantile Library of New York have old copies? 2. When was the *Emigrant and Old Countryman* published, and where could I find its files? 3. My pointer, though seemingly well, has small lumps all over him. Can they be typhoid, or are they like lumps on a child? The dog seems to be much troubled by flies, and these lumps, though not in any way sore, seem to itch and make his coat rough. Kindly suggest what is proper to rub him with. Ans. You would be as likely to find both the papers you refer to at the Library as anywhere, but believe complete files are not to be found. 3. The trouble with your pointer is doubtless either flies or fleas. Wash him occasionally with Caswell, Mack & Co.'s juniper tar soap, and when itching is severe ally with a solution of common cooking soda.

INQUIRE, Troy.—My setter dog is troubled with a "breaking out" that first appears in little water blisters, and itches intensely. It is on his lips, around the rims of his eyes, with patches on his breast and on the inside of his forelegs. These parts seem slightly swollen, and the rash appears to be spreading. It is about two weeks since I first noticed it. He acts dumpy; his coat is rough and staring, as he has some of his old hair on yet; he eats but little, and can keep nothing on his stomach. We feed him on table scraps, and he has exercise enough, having the whole run of a farm without being confined at all. Ans. Wash thoroughly with tepid water and Caswell, Mack & Co.'s juniper tar soap, at least once each day. Apply also twice each day the following mixture: Powdered ex. borax, 1 dr.; chloroform, 2 drs.; glycerine, 4 drs.; rose water, q. s. t. make a half pint. Give internally a half teaspoonful of elixir of iodo-bromide of calcium three times a day. See that the bowels are regular, for which Prescription No. 8 A, Hallock's Sportsman Gazetteer will be best.

E. D. W., Dover, N. H.—1st. Is there a recruiting officer at Boston so I can enlist? What age, height, etc., do you have to be in order to enlist in the regular army? 2d. Please inform me how they decide the "League games" of base ball, who are champions as I noticed the St. Louis last week was reckoned ahead of Boston, and Boston had won two more games than St. Louis had? 3d. Is the coming rifle match for the winning of the Centennial Trophy? 4th. When does the law on partridges go out in New Hampshire, the 1st or 20th of Sept. 7th. To whom falls the power of selecting the Captain of American Rifle Team for 1877? 6th. I hear that there is going to be a base ball club in Hartford, Conn., next year, will the Hartforders of Brooklyn play next year if that is the case? 7th. Will Mr. Hallock write any items for FOREST AND STREAM while on his visit to the west? Ans. 1st. If there is no recruiting officer you can enlist at the forts in the harbor. Eighteen years of age, five feet four inches is the lowest standard. 2d. The club that is ahead when the specified number of matches is played is the champion. 3d. Yes. 4th. Sept. 1st. 5th. The team itself. 6th. Cannot say. 7th. Probably; there was a note last week from him.

—Undoubtedly one of the best and cheapest stocks of Carpentries, Oilcloths, Mattings, etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington street, Boston. I. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him or with any orders sent him. It is a good, reliable house.—[Advs.]

## A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.  
(Post Office Box 2832.)

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, AUGUST 16, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mailservice if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS,  
Business Manager.

S. H. TURRILL, Chicago,  
Western Manager.

## CALENDAR OF EVENTS FOR THE COMING WEEK.

**Friday, Aug. 17.**—Trotting: Lowell, Mass.; Warwick, N. Y.; Mendota, Ill. Running meeting at Saratoga. Base ball: Cincinnati vs Hartford, at Brooklyn; Louisville vs Boston, at Boston; Monticello vs Noisy, at Astoria, J. I.; Ottumwa vs Remington, at Davenport, Ia.; Stowe vs Jaymaker, at New Haven, Conn.; Arlington vs Alaska, at West Brighton; Hornell vs Dansville, at Hornellsville, N. Y.; Columbia vs Active, at Jersey City; Indianapolis vs Allegheny, at Allegheny, Pa.; Rochester vs Star of Syracuse, at Rochester. Regattas: Pillsbury Club; Northwestern Amateur Rowing Association, at Detroit, Mich. Creedmoor: Infantry, 1st Brigade, 1st Division. Cricket: Ottawa vs Toronto, at Ottawa. Pigeon match: Philadelphia and Narragansett Gun Clubs, at Newport.

**Saturday, Aug. 18.**—Running meeting at Saratoga. Base ball: Cincinnati vs Hartford, at Brooklyn; Louisville vs Boston, at Boston; St. Louis vs Chicago, at Chicago; Stowe vs Jefferson of Hartford, at Meriden; Arlington vs Noisy, at Stapleton, S. I.; Everett vs Seneca, at Greenville; Nameless vs Hudson, at Brooklyn; Orange vs Chelsea, at Orange, N. J.; Indianapolis vs Allegheny, as above. Creedmoor: Fourth comp. for Parker Shot Gun; Seventh Regt. Rifle Club Comp. for Sharp's Special Military Rifle. Cricket as above. Regattas: New Rochelle Yacht Club; Northwestern Ass. as above.

**Monday, Aug. 20.**—Running meeting at Saratoga. Base ball: Rochester vs Tecumseh, at Rochester. Creedmoor: Infantry; 2d Brigade, 1st Division. Athletic games of Philadelphia Caledonian Gun Club.

**Tuesday, Aug. 21.**—Trotting: Chatham Village, N. Y.; Earlville, Ill.; Poughkeepsie, N. Y.; Pittsburgh, Pa. Running meeting at Saratoga. Base ball: Cincinnati vs Boston, at Boston; Louisville vs Hartford, at Brooklyn. Creedmoor: Cavalry: Contest for the Washington Grey's prize medal; comp. for Kent glass. Regatta of Beverly Yacht Club.

**Wednesday, Aug. 22.**—Trotting as above; also at Meadville, Pa. Running meeting at Saratoga. Creedmoor: Practice. Union Regatta at Cotuit Port, Mass.

**Thursday, Aug. 23.**—Trotting as above. Running meeting at Saratoga. Base ball: Cincinnati vs Boston, at Boston; Louisville vs Hartford, at Brooklyn; Rochester vs Star of Syracuse, at Rochester. Creedmoor: Third Brigade, 1st Division. Regatta of Rockaway Yacht Club.

**Bogardus' Score Book.**—This is a neat little work of eighty pages, of a size handy for the pocket, and is invaluable to the trap shooter, whether amateur or professional; it may also be used as a score book for field sports. The fact that Capt. A. H. Bogardus is the author, is sufficient evidence that the work is complete.

**THE SPORTSMAN'S GAZETTEER.**—I have been more than pleased with the Gazetteer, and don't know how we have kept house so long without it. I am constantly referring to it for information concerning fishes that previously I had to search a whole library for. Very truly yours,

FRED MATHER.

## FIELD SPORTS.

WHAT is there so fascinating about Field Sports that its lovers will travel thousands of miles, spend thousands of dollars, endure torrid heat and frigid cold, run risks that seem almost foolhardy, scale mountains, shoot rapids, cross arid deserts, thread trackless forests, and do a thousand other monstrous things to indulge their ruling passion?

The above question is often asked by those who know not the joys of a sportsman's life and with some shadow of reason, perhaps, when we consider how little is known outside the fraternity of the hidden thrills and nerve stimulating forces bound up in those simple instruments, the rod and gun.

Man is born with certain physical and moral attributes and instincts, and the exercise of these is just and right. He has facial muscles, he cannot laugh without facial muscles, *ergo*, it is right for man to laugh. And so on indefinitely, taking up each sense and attribute in order, the same rule will apply. And when we reach his higher and more spiritual nature, we find him still following out his instincts—doing right when he follows them squarely, doing wrong when he flings them aside and becomes bound up in self and worldly gettings.

When childhood and youth are past, and we look back through the vista of years, and in the joys of retrospection become for the nonce a child again, how sharp the pang when, the bright day-dream over, we find that we are old, our youth and freshness gone, and nothing left but stern reality. Then what would we not give for one hour of that merry, care-free childhood? What would we not give to be as innocent and joyous as in those halcyon days when we saw but the rose, and had not, as now, discovered the singing thorn?

But "We may be happy yet." There is a remedy for all this. Every man, who is a man, and appreciates the workings of his better self, has but to follow that instinctive love for nature which is surely in his heart, developed more or less, to find a certain sure relief that will bring him nearer to that childlike innocence and happiness for which he has so often longed.

These men who spend their time and money so lavishly have found this out. They know they get returns on the investment a "hundred fold."

Ask yonder gray-haired veteran busy with leaders and fly books, his face lit up with an enthusiasm almost boyish in its perfect happiness, if it pays him to leave his business in the hands of others for a four-weeks' sojourn at Rangeley? He will tell you "Aye, a thousand times aye," and like as not add: "The only time I really live is when I am whipping a trout stream during my vacation. Why, my dear sir, if on some fine June morning I should get a heavy strike, and, realizing the fact that a six-pound trout was appealing to all my skill as an angler to effect his capture—if at this juncture I should receive a telegram stating that my warehouse and all its contents had been destroyed by fire, I would respectfully say to the messenger: 'I will see you again,' and go on and catch my fish."

There is something ecstatic in the *feel* when a trout strikes. It cannot be explained; it is a mystery, a tingling, scintillating, nerve-tensive mystery, and so fascinating that the trout angler looks upon his sport as the height of earthly happiness. And well he may, for when is a man happier than when arrayed in his old clo' and *holy* fishing boots, with rod in hand sauntering along some favorite stream? Blue sky, pure air and sparkling water, blessed trio, the angler's beatitudes; how they build him up and add years to his life! With what a zest he takes hold of his business when he returns. Problems that once seemed beyond mortal ken to solve are now as clear as noonday. Perplexing business matters once so intricate as to defy his utmost ability to unravel, now arrange themselves in perfect order. In a word, from the listless, morbid being of a month ago, he has been metamorphosed into a stirring, active business man.

"A fool and his money are soon parted." So says the "base and soulless worldling," when he hears of some member of his club paying two hundred and fifty dollars for a new gun. Poor fellow! He has never learned the rule for computing the profit on an investment of that sort. He knows nothing about the pleasures of the field. He never trudged through the stubble at early dawn and participated in the sport of quail-shooting. He never was startled by the hurrying whirr of the cock grouse as he clears the undergrowth and stretches away, nor felt the grateful tingling of the warm blood coursing through each vein and artery as it leaves the heart, where it was confined for that single instant when each faculty was intent on covering the bird, when he sees the stream of feathers flying on the morning air, and hears the resounding thump which announces a dead shot. He never waited for hours secreted in a blind, cold and uncomfortable, his eye roving from decoys to horizon and back to decoys again, until it seemed they'd never come; nor felt the breathless anxiety as a black V shaped line came moving up, up, nearer, nearer, assuming more definite form as it comes rushing on, until at last a great flock of brant are lighting, gabbling and diving among the decoys, and then the culmination of all this in the double discharge of his heavy ducking gun, the result of which pays for the patient waiting ten times over. He never stood at a runway with cocked rifle waiting for the red deer, which is even now approaching, as he knows by the deep-moaned music of the hounds, morally certain that the quarry will pass his stand within shot while he bids his heart "be still," grudging it each pulsation which may tend to swerve his trusty piece, until the other heart has ceased to beat through his true aim. Oh no! He never knew

the sweets of Field Sports, or he wouldn't have found fault with his friend when he paid the (to him) exorbitant price for a gun.

Man loses nothing by indulging his purer sporting proclivities. On the contrary, he is the gainer by it; that is, if you count a clear, vigorous brain and a sound body, at the expense of a moderate outlay of money, a sufficient recompense. Mental and physical labor require relaxation, not that conventional production found at Saratoga or Long Branch, but the natural, God-given kind, furnished to man but for the taking, which lurks in stream and forest, among the darting trout and sylvan denizens.

Oh! ye who live a pack-horse life, who toil and moil year in and out, who let the seasons slip by unheeded or simply notice them in their flight as times when trade or stocks are brisk or dull, who never go out and commune with nature, filling yourselves with that inspiration which comes through pure air and freedom from corroding care,—do you know that you it is, not we who are the wasters of this precious life so kindly granted us? Do you realize how much of joy you are losing—how you are cutting off your years before their time,—sacrificing your purest, noblest instincts on the altar of your ambition or lust of gain—becoming dull and misanthropic through a mistaken notion that life was made for unremitting toil? Throw off these foolish prejudices, and in this lovely spring-time go out beneath the blue canopy of heaven, study nature and all her gentle revelations, pointing you to a higher, nobler life. Take gun and rod along, use them understandingly, and you will find that God did not make man for the world, but the world for man.

H. W. DE L.

**THE THRUSH.**—The thrush is scarcely surpassed by any other bird, excepting the nightingale, and pours forth his full wealth of song in varied form, upheaving his parded breast, and looking out upon the still landscape with bright, restless eyes. We hear him singing in the early morning, before the round sun has scaled the hill-tops. He keeps up his music throughout the day and closes at night without any apparent fatigue. There is no diminution of sound, no feebleness; he seems more like a good instrument which, after being played on for hours, sends forth a sweeter sound; he is no weak traveler who, having gone a long day's journey, drags wearily up the drive at sunset. You cannot fail to distinguish his voice from among the warblers of the woods; not that his notes are always alike, but there is some regular modulation, a natural sweetness, which, however varied, "still does his touch the strain prolong," and you know it is his own, and could not be deceived even if he had hidden himself in the carcass of an owl. "I recollect well," says an Englishman, "that one of the first birds I reared when a country boy was a thrush. He was the pride and delight of the whole neighborhood; even the neighbors forgave him for breaking their slumbers so early in the morning for the sweetness of his song. An old fisherman who arose with the break of day, and who resided in the adjoining house, made the opening of his music a clock to get up by, and he never was really deceived in time but once, and that was one rarely beautiful moonlight morning which streamed in brilliant beams through the window shutters, and lured the lovely bird into the belief that it was day."—Translated from the German.

**PHYSICIAN'S OFFICE CASE-RECORD AND PRESCRIPTION BOOK.**—We are in receipt of a copy of this work at the hands of the publishers, Robt. Clark & Co., of Cincinnati, O. It is the most perfect prescription book and case-record ever published, having duplicates for prescription, and spaces for recording name of patient, address, diagnosis, physique, pulse, temperature, respiration, etc., enabling the practitioner to keep the treatment of his case more clearly in view; moreover, it is a very convenient and excellent device against errors in writing prescriptions. If physicians once use this work they will never again be without it. Apothecaries should provide themselves with them, for the benefit of physicians. The same firm also issue a *multum in parvo* pocket edition, combining a visiting list, prescription blank book, and case-record, which is simply invaluable.

**IN AID OF THE CHURCH OF ST. AGNES.**—A series of athletic games and other sports will take place Monday, the 20th inst., at Jones' Wood, for the benefit of the Church of St. Agnes in E. 43d st., near Lexington ave. They will mainly consist of walking matches and running matches for young men, a comic mule race, fat men's foot races, a fat pig hunt, greased pole climbing, and boys' egg and spoon races. A handsome silver cup, a silver medal, made and engraved at Tiffany & Co.'s, a watch, a gold-headed cane, several purses, and other handsome prizes will be put up for the contests. Entries to all the races are being made now by Mr. F. W. Whittaker, 350 Fourth Avenue.—[Ado.]

**YOUNG QUAIL.**—On Saturday, July 17, as a farmer was mowing on Mr. Foster's meadows near Williamsburgh, he cut off the head of a female quail. Her nest was found close by, containing sixteen eggs. These were taken and hatched by a chicken and then given to a male California quail, who has since cared for, and brooded them, evincing all the solicitude of a parent, ruffling his feathers and biting at any one that offers to approach the little ones. The youngsters exhibit great dexterity in catching flies from the bars of the cage, and are so tame as to even take them from the hand when offered. They may be seen at Theodore Krauss', 372 Old Bushwick Avenue, Williamsburgh.

GAME PROTECTION.

INDIANA.—Section 5 of the Game Law now in force in this State reads as follows:—

That it shall be unlawful for any person to net or trap at any time, or kill any duck between the fifteenth day of April and the first day of September in each year; and any person violating the provisions of this act shall, upon conviction thereof, be fined in the sum of two dollars for each wild duck so unlawfully trapped, netted or shot."

The Tolleston Club, of Chicago, have united with the local authorities at Tolleston, and the law is to be enforced at all hazards.

IOWA.—*Cedar Rapids, Aug., 8.*—Our game law, as amended by chapter 123, laws of 1876, makes it unlawful "for any person anywhere, at any time of the year to shoot or kill any prairie hen or chicken for the purpose of shipping to any point within or without the State for the purpose of selling the same for profit." Penalty \$5, each bird. A person may ship any of our game birds to a person within or without the State, not exceeding one dozen in any one day, by making proper affidavit and delivering a true copy thereof to the common carrier or railroad agent, which must set forth: 1, That the shipper is a resident of this State; 2, That the same is not shipped for sale or profit; 3, Name, and post office address of consignee; and 4, The number of birds shipped. *Amers.*

MICHIGAN.—*Saginaw, Aug. 9.*—Notwithstanding the fact that the game laws of Michigan forbid the shooting or killing of deer, wild turkey, partridge, quail, and every species of wild duck and water fowl at this season of the year, it is a fact well known that the game laws are being violated in this vicinity in a shameful manner; scarcely a day passes but new cases of deer and duck shooting come to light. As high as sixteen or eighteen wild ducks have been counted in the boats of these law-breakers, as the result of only one day's shooting. Rumor has it that wild duck can be obtained at certain restaurants in this city and Saginaw city upon call. Young ducks, fledglings and whole broods share the general slaughter.

It is also a well known fact that deer are now being daily killed along the line of the Jackson, Lansing & Saginaw and Flint & Pere Marquette Railways, though the law prohibits their shooting until the 15th of September. Game is rapidly being exterminated and driven farther and farther from the city, and the rich rice marshes north of the city, which, a few years ago, would yield fifty or sixty ducks to a single gun in a day, are now nearly depopulated of their web-footed inhabitants.

MICHIGAN.—The game laws of Michigan which have long been openly violated in the game districts about Saginaw and East Saginaw City, Mich., are now to be enforced. A meeting of sportsmen was held Aug. 9th, at East Saginaw, when a permanent organization was effected with the following officers: Pres., Reuben Fairchild; Vice-Pres., H. B. Roney; Sec. and Treas., Leander Lee.

FLORIDA.—*Tampa.*—The game law is well observed in this and adjoining counties. One man in Manatee County killed a deer the other day; but he won't violate the law again—it took about all he had to pay the fine. *W. H. S.*

—The fancy prices at which deer forests in Scotland are nowadays let would have sent Dumbiedikes, Ellangowan, and Monklands into fits. Sir John Ramsden gets £3,500 for two months for one, and £3,000 a year for another, and a competent authority estimates the annual lettings of Inverness and Ross-shire at £80,000 a year. Half a century ago they would not have been worth a tenth of that sum. Holders of almost valueless Adirondack district property may yet have their day. There are nowadays ten times as many men of pleasure here as there were fifty years ago, and a great deal of cash has gone out of the pockets of rich Americans into that of Scottish lairds.—*Ex.*

BOB WHITE.

[FROM OUR SPECIAL CORRESPONDENT]

FEEN BANE, July 19, 1877.

EDITOR FOREST AND STREAM:

I wish to correct a statement of mine in your issue of July 12 as to the close season for quail in the State of Ohio, to the effect that it was extended so as to include the current year. I certainly understood "Gloan" to say so and gave him as my authority for the statement, but finding it doubted by several well-posted members of the Cincinnati Shooting and Fishing Club, I referred the question back to "Gloan" who addressed me the following letter, which I hope you will find room for.

MY DEAR COL.

By the latest law—the very latest, mark you—the prohibition against quail-shooting in this State expires in November next and the season is then open until January 1.

This will be pleasing information to our sportsmen which will be enhanced by the knowledge that never for years have the birds been so abundant as now.

By the inclosed you will see that you are not alone in your humanitarian views of the glass ball trap.

The Executive Committee of the Cuvier Club at its last meeting presented the following report, which was adopted *un. con.*

"Mr. Logan, from the Executive Committee, read the following report:

"The Executive Committee take pleasure in informing the Club that they are about to purchase a glass ball trap, to be put at the disposal of all members of the Club who wish to use it. And the committee desire to state the reasons which have prompted their action.

"It is well known that the Cuvier Club has always resolutely opposed prize pigeon shooting in all its phases.

"The Club was not insensible to the arguments by which such practices were sought to be upheld. There were the improvement in marksmanship, healthfulness of out door exercise, the encouragement of a taste for the gun, and the much needed relaxation from business.

"To all these the Club gave its hearty approval. Indeed,

all these are intimately blended with the avowed objects of the Club. But against them there were counter arguments, unnecessary to be repeated, which outweigh the other considerations.

"This action has provoked the displeasure of some, who have openly charged that the Club was an iconoclast; that it destroyed but never created, and that the interests of the gun were purposely ignored.

"In the introduction of the glass ball the Club sees what it hopes may prove a solution of the difficulty, a pastime which embraces all the benefits, without the drawbacks, of the pigeon trap. It may happen, however, that in time the one may become as much perverted and objectionable as the other, in which event it should be immediately abandoned.

"To avoid this, the committee desire to aid it by their encouragement, that it may not fail from the first for want of reputable recognition; and while the Club as a club does not intend to inaugurate or carry on trap matches, yet it provides that as one of the many sources of recreation for its members."

I am sure you will second these sentiments. *GLOAN.*

I am glad that I was mistaken, for from my own observation and from what I hear from all parts of the State birds have rarely been so abundant as now and they have had a favorable season for the hatching, and we have had no torrential rains to drown the young broods.

Ap[ro]pos of Bob White, permit me to take this opportunity of relieving my conscience for ever having assented to call this—take him all in all, the sport which he affords when shot over well-trained dogs, and his edible qualities, the noblest of all our game birds—a quail.

It may be because I was born and grew to manhood in a Southern State, but I will confess that I have never, as I have often done, called our *Perdix virginianus* a quail without a certain degree of compunction at having contradicted, as it were, such illustrious men as Nuttall, Wilson, Audubon, Bonaparte, and others who have devoted time and labor to the special study of ornithology, and who all call the bird a partridge!

I have shot the quail proper on both sides of the Mediterranean, and, knowing his habits and qualities thoroughly, I feel as if I were inflicting a wrong on our game little whistler, and insulting him by calling him a quail. There is physically a wide difference between the two birds and that greatly to the advantage of our native Bob White. The quail proper is not as large by half as our own bird, nor is his plumage half so beautiful; his flesh is dark; and, having no tail to speak of, he compares with our Virginian partridge as would a dung-hill fowl with one of Van Winkles or Perry Baldwin's game-cocks. The quail proper is an immoral little cuss after the manner of the Mormons or Mohammedans, taking as many wives as he can get; and, worse than the human polygamist, he disdains the cares and responsibilities of paternity. What a noble moral contrast does our bird present! He has but one wife, and all the affections of his faithful little heart are bestowed upon the gentle mate won at the risk of his life in many a hard fought battle. And what a model husband Bob White makes when alive, and what a succulent pie when dead! What grand sport he affords to the sportsman and what gustatory delight to the epicure.

But there are other differences between the birds. The quail proper is as strictly migratory as the swallow. He changes his climate twice a year on wings which bear him across the broad Mediterranean Sea, on both shores of which he is found in great multitudes, whereas our *Perdix virginianus* is a home-staying, domestic bird, associating for the greater part of the year with his own family only, the wife of his bosom and the pledges of their mutual love. *Perdix* does travel from one district to another in search of food or better cover, but his powers of flight are not equal to migration across seas and continents, for he cannot cross over larger rivers.

The above are some of the reasons for my reluctance to depart from the Southern nomenclature and degrade gallant Bob White into a quail.

But seriously, Mr. Editor, our writers on field sports should be less careless in the nomenclature of our game and as solicitous for the instruction of their breeders as for the enforcement of the game laws. *F. G. S.*

FRAUD.—Early in June I noticed in FOREST AND STREAM an "ad." inserted, I presume, by some parties styling themselves the "Western Gun Works," 69 Dearborn street, Chicago, offering, on receipt of \$3, to forward to any address a handsomely got-up revolver. Assuming, from the respectability of your paper, that the "ad." was genuine, I forwarded the money (\$3), but have not got the revolver, although I have written several times to know the reason why. On August 2 I wrote to M. C. Hickey, Esq., Chief of Police, who replied: "There was such a firm here, but they are now busted." *W. P. S.*

Brooklyn, Aug. 9, 1877.

[Three dollar revolvers are a fraud, and so are the \$5 rifles, both inadvertently advertised by us. We do not intend any unreliable article or concern shall be advertised in our columns, but unfortunately, through press of business, etc., due to the Consolidation, the Western Gun Works of Chicago and \$5 rifle—which is nothing but the old Star carbine—obtained a single insertion in our columns. Accidents will happen, but we have taken measures to prevent their recurrence.—Ed.]

REMINGTON'S CATALOGUE.—Remington & Co. have just issued a new catalogue for the present year of their breech-loading firearms. This leaves nothing to be desired, being not only a complete catalogue, but a treatise on rifle shooting, history of gunmaking, record of international rifle matches, and rules and regulations for shooting at long-range. The well-known character of Remington & Co. is evidence sufficient as to the correctness of this elegant little work.

OUR WASHINGTON LETTER.

ORTOLAN AND REED BIRD SHOOTING ON THE MARSHES—DO ORTOLAN HAVE FITS?—REED BIRD DIET FOR SNAKES AND EELS.

[FROM OUR SPECIAL CORRESPONDENT.]

WASHINGTON, D. C., Aug. 10, 1877.

THE season for marsh-shooting on the Potomac and neighboring streams in this vicinity as well as in Maryland and Virginia is drawing near, and there will soon be fine sport among the ortolan and reed birds which frequent these marshes during the first month or six weeks of autumn. Ortolan (*Porzana carolina*), or as they are often called, som rail, reach here about the middle of August on their return from the breeding grounds on the borders of the great Northern Lakes, and always tarry here, finding abundance of food in the marshes in this locality, among which are those just off the city adjoining Annapolis Island, and opposite, covering an area of several hundred acres. The largest marsh, however, is that near Benning's Bridge, on the Eastern branch, which is about four miles long, and varies in width from a quarter to a half of a mile. Other marshes are lower down the river in the neighborhood of Alexandria and Fort Washington, and upon all of them the birds find abundance of food, skulking amid tall reeds and grasses, both by day and night, in search thereof. During the first two or three days of the season, which begins on the 5th of September, as many as six or eight dozen ortolan are sometimes killed by one gunner on a single tide, but as the season advances the birds are killed off, others migrate southward, and in a few weeks they become scarce. They seem to have a premonition of a sudden cold snap, and often vacate the marshes in a single night in case of a sudden change in the weather, seeking the more sunny skies of the South. Although a spring visitant they remain here but a short time at that season, evidently being in a hurry to reach their breeding grounds. On their return in the fall their flight is much slower.

For ortolan shooting in this locality the requisites are: first, a light skiff drawing but two or three inches of water so it will slide over the weeds and grass at high tide when the marshes are covered with water; next, the services of an experienced pusher must be secured. He is furnished with a pole twelve or fourteen feet in length, having a cross-piece about six inches long at the end to prevent it sinking in the mud. The gunner takes his position in the bow and his pusher in the stern of the boat, and about two hours before high water they can enter the marsh. As the tide rises the birds are more easily put up, and the sport continues until about two hours after high water, when it becomes a difficult matter to push the boat, on account of the receding tide; besides, the birds are then able to hide under the weeds and will not rise. It is the business of the pusher to always mark the spot where the dead bird falls, and direct the boat thereto, as the gunner generally has all he can do to load and fire as the birds rise, two or three at a time, all within shot, but from different places. Ortolan will only rise when the tide is too high to prevent them hiding at the approach of a boat, and then they fly with dangling legs, proceeding but a short distance, when they drop with outspread wings among the reeds. It is an easy matter to put the same bird up two or three times, but after that they become frightened and dive, keeping their bill only above the water.

I have known of two instances where ortolan were suddenly approached by a boat, and manifested such fear that they had convulsions and rolled over and over a half a minute or more before recovering consciousness. In one case, the bird, after going through various antics, flew and was killed, but in the other the bird, after regaining its senses, dove, and could not be put up again. I mention this fact as the result of actual observation, and have no doubt that the same thing has been observed here and elsewhere by those accustomed to noticing the habits of birds of this character.

Reed birds, as they are called in this vicinity, but rice birds further South, and bob-o-links in Northern States, are here in the fall in incredible numbers, and as they are always found in flocks many are often killed at a single shot. About two weeks after their arrival here they grow fat upon the wild oats which constitutes their principal food. Indeed I have known them to be so fat that they could not fly any great distance, and when in this condition they are esteemed as a great delicacy, frequently bringing from 75 cents to \$1.25 per dozen in our markets, where they find ready sale. Numbers of them are wounded during the season, when flocks are fired into; but those unable to fly, although they may succeed in hiding from the sportsman after being dropped, soon fall the victim of suckers and eels. On several occasions I have knocked down reed birds, and upon going to the spot to pick them up, have found a villainous water snake, sometimes two or three feet long, feasting upon the bird, having grabbed the dead or wounded bird which happened to fall near his snakeship. It is needless to say I invariably gave the snake the contents of one barrel.

Eels, too, frequently capture dead birds and drag them off under the weeds, where they soon devour them.

Reed birds, unlike the ortolan, seldom penetrate into the interior of this country, but from the time they reach our shores from the West Indies, in early spring, seem to prefer the marshes bordering the Atlantic coast. The plumage of the male bird changes in the spring to bright and attractive colors, but after the breeding season

is over they lose their gay livery and assume the yellow hue of the females. They do not tarry here in the spring longer than a few days, and their flight at this season is mostly at night, but upon their return Southward in the fall their flight is diurnal. They breed in Northern latitudes, each pair of birds raising from four to six at a brood. The young birds soon join their parents and other families, forming immense flocks, in which they commence their Southern journey in August, tarrying upon the numerous marshes en route for food and rest. Toward the latter part of fall they have reached our extreme Southern rivers and estuaries, and by the first of December they have all left the country for a more tropical climate.

In both reed bird and ortolan shooting we use small loads, about two drachms of powder and one ounce of No. 9 shot, as the birds are most always dropped within forty yards, and besides they are much easier to kill than either a partridge or woodcock. Another favorite shooting ground in this locality is at Hill's landing, on the Patuxent River, about eighteen or twenty miles from this city. The birds here are not hunted to as great extent as on our marshes, and as a consequence they are very plentiful. The Virginia Rail (*Rallus virginianus*) is also found there, but are not abundant.

The fresh water marsh hen, "king ortolan" (*Rallus elegans*), is sometimes found upon our marshes, though never in numbers. These birds are much larger than the ordinary ortolan, and exceedingly shy. It is a difficult matter to get a shot at them. Besides the ortolan and reed bird we often find different species of plover, summer duck, and other game birds frequenting fresh water marshes.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining, to imitate the genuine article) without letting our customers know just what they are getting.

P. O. BOX, 1,294.—*Advs.* ANDREY & IMBRIZ, 48 Maiden Lane.

## The Rifle.

**OFF-HAND MID-RANGE SHOOTING.**—On the afternoon of the 1st inst. a novelty for off-hand shooters was tried at Creedmoor in the first contest for a gold badge presented by Brigadier-General Daniel D. Wylie, open to members of National Rifle Association or National Guard, State of New York; weapon, any military rifle; distances, 300 and 500 yards; position, standing at each distance; rounds, seven at each distance, without sighting shots; cleaning allowed only between distances; badge to be won three times (not necessarily consecutively) before becoming the personal property of the winner. To make a decent score at 500 yards off-hand, with a 6-pound pull, open-sight rifle, requires a rare combination of steadiness and judgment, and to those who consider all prone shooting childish, the Wylie badge match will give opportunity to air their theory in practice. The scoring as done under these conditions was really very fair, and out of a possible 70 the scores ran (as the competitors used the Remington N. Y. State model rifle, cal. .50, excepting Mr. Collins, who used a Sharps rifle):

|                       | 300 yards.     | 500 yards.          |
|-----------------------|----------------|---------------------|

**THE SHARPS' MATCH AT CREEDMOOR.**—The sixth contest for the Sharps' Rifle Co.'s prize of \$250 gold was held at Creedmoor on Saturday last. The match is the ordinary 45-shot long-range one, except that coaching is strictly forbidden, and the winner is to lead at all three of the ranges. On Saturday Major Fulton was fortunate enough to lead at 800 and 1,000, but unfortunate enough to "flunk" at 900 yards. With a boisterous wind the scores stood:

|                                      | 800 yds. | 900 yds. | 1,000 yds. | Total. |
|--------------------------------------|----------|----------|------------|--------|
| Henry Fulton, Rem. Creed.....        | 65       | 65       | 65         | 195    |
| W. H. Jackson, Rem. Creed.....       | 65       | 65       | 65         | 195    |
| J. L. Allen, Sharps Creed.....       | 64       | 64       | 61         | 189    |
| C. E. Blydenburgh, Sharps Creed..... | 63       | 65       | 59         | 187    |
| W. M. Farrow, Ballard.....           | 61       | 58       | 58         | 177    |
| W. G. Dunn, Sharps Creed.....        | 62       | 65       | 66         | 193    |
| L. Weber, Sharps Creed.....          | 62       | 64       | 64         | 190    |
| A. V. Canfield, Jr., Rem. Creed..... | 61       | 67       | 62         | 189    |
| F. Hyde, Sharps Creed.....           | 61       | 64       | 47         | 172    |
| G. L. Morse, Sharps Creed.....       | 65       | 61       | 67         | 193    |
| R. Rathbone, Rem. Creed.....         | 57       | 62       | 66         | 185    |
| J. F. Waters, Rem. Creed.....        | 57       | 59       | 63         | 179    |
| I. Fisher, Fisher M. L.....          | 56       | 59       | 39         | 154    |
| F. A. Dugro, Ballard.....            | 41       | 48       | Retired.   |        |

**THE IRISH-AMERICAN MARKSMEN.**—The members of the Irish-American Rifle Club, at their regular shoot last Saturday, showed good average shooting, and the club, by regular practice, are certainly pulling together a very respectable team. The last shoot was for the Burton prize, 7 shots at 200, and 7 at 500 for military rifle, and 600 for any rifle. Gen. Milten, Col. Burton and Mr. Malby came within the latter class, the range totals standing:

|                     | 200 yds. | 500 yds. | Tl. | 200 yds.            | 500 yds. | Tl. |
|---------------------|----------|----------|-----|---------------------|----------|-----|
| N. D. Ward.....     | 25       | 31       | 56  | G. F. Merchant..... | 26       | 47  |
| P. F. Milhen.....   | 21       | 32       | 53  | J. McHugh.....      | 26       | 41  |
| S. F. Kneeland..... | 24       | 25       | 49  | B. Dully.....       | 19       | 29  |
| B. Burton.....      | 20       | 29       | 49  | J. Kerr.....        | 19       | 39  |
| A. M. Malby.....    | 29       | 29       | 47  |                     |          |     |

After the shooting a meeting was held, and a challenge from the Greenwich (Conn.) Irish-American Club was considered and accepted. Also a challenge was resolved upon for their ancient rivals, the New York Scottish-American Rifle Club.

**THE AMERICAN TEAM SELECTION.**—The competitions for places on the American team of 1877 was continued on Tuesday and Wednesday of last week, and good scores were shown on both days, the scores standing on the first day:

|                         | 800 yds. | 900 yds. | 1,000 yds. | Total. |
|-------------------------|----------|----------|------------|--------|
| Isaac L. Allen.....     | 71       | 69       | 65         | 205    |
| W. H. Jackson.....      | 74       | 69       | 61         | 204    |
| N. Washburn.....        | 72       | 71       | 57         | 200    |
| L. L. Hepburn.....      | 67       | 67       | 64         | 198    |
| Henry Fulton.....       | 76       | 67       | 64         | 207    |
| L. C. Bruce.....        | 71       | 68       | 58         | 197    |
| F. Hyde.....            | 66       | 70       | 60         | 196    |
| T. Lamb, Jr.....        | 72       | 62       | 60         | 194    |
| R. C. Coleman.....      | 69       | 68       | 56         | 193    |
| Major H. S. Jewell..... | 65       | 68       | 59         | 192    |
| C. E. Blydenburgh.....  | 71       | 65       | 55         | 191    |
| L. Weber.....           | 71       | 62       | 56         | 189    |
| Gen. T. S. Dakin.....   | 69       | 61       | 57         | 187    |
| W. G. Dunn.....         | 69       | 62       | 59         | 188    |
| H. F. Clark.....        | 72       | 57       | 56         | 185    |
| W. Davidson.....        | 70       | 59       | 57         | 186    |
| A. V. Canfield, Jr..... | 72       | 65       | 40         | 177    |
| A. D. Hodgman.....      | 62       | 60       | 61         | 183    |
| Homer Fisher.....       | 62       | 65       | 41         | 168    |
| G. L. Morse.....        | 65       | 53       | 47         | 165    |
| G. W. Yale.....         | 65       | 51       | 41         | 157    |
| R. Rathbone.....        | 71       | 61       | Retired.   |        |

The aggregate score made by the first eight men was 1,500 points.

On the second day's shooting the totals were:

|                         | 800 yds. | 900 yds. | 1,000 yds. | Total. |
|-------------------------|----------|----------|------------|--------|
| I. L. Allen.....        | 71       | 71       | 70         | 212    |
| W. H. Jackson.....      | 73       | 71       | 74         | 218    |
| Gen. T. S. Dakin.....   | 69       | 67       | 70         | 206    |
| H. S. Jewell.....       | 69       | 69       | 71         | 209    |
| L. Weber.....           | 67       | 67       | 68         | 202    |
| H. F. Clark.....        | 65       | 68       | 64         | 197    |
| Frank Hyde.....         | 66       | 67       | 61         | 194    |
| L. L. Hepburn.....      | 70       | 64       | 64         | 198    |

| Willcox Gunn.....       | 69       | 59       | 67         | 195    |
| C. E. Blydenburgh.....  | 72       | 61       | 62         | 195    |
| T. Lamb, Jr.....        | 65       | 65       | 60         | 190    |
| L. C. Bruce.....        | 70       | 60       | 60         | 190    |
| G. W. Davidson.....     | 60       | 64       | 62         | 186    |
| R. C. Coleman.....      | 70       | 62       | 64         | 196    |
| A. V. Canfield, Jr..... | 63       | 50       | 63         | 185    |
| R. Rathbone.....        | 53       | 67       | 63         | 183    |
| G. L. Morse.....        | 53       | 67       | 69         | 179    |
| N. Washburn.....        | 68       | 68       | 53         | 172    |
| A. D. Hodgman.....      | 65       | 63       | 41         | 172    |
| Homer Fisher.....       | 66       | 57       | 40         | 163    |
| G. W. Yale.....         | 55       | 55       | Retired.   |        |

Several days were added by the committee to those already fixed for the completion of interrupted scores, and on Saturday a few went down and fired over, scoring as follows:

|                  | 800 yds. | 900 yds. | 1,000 yds. | Total. |
|------------------|----------|----------|------------|--------|
| L. Weber.....    | 69       | 68       | 63         | 200    |
| T. S. Dakin..... | 69       | 69       | 55         | 193    |
| H. F. Clark..... | 62       | 62       | 60         | 184    |
| R. Rathbone..... | 57       | 44       | 29         | 130    |

Mr. Rathbone undertook to try a new gun, and was punished for his foolishness in a low score.

**THE NEW YORK SPOOK EXCHANGE RIFLE CLUB.**—Shoot in the second competition for the Worcester medal on the 1st inst. The conditions require ten shots per man at 200 yards, any rifle, off-hand. At the last match the badge went to C. Dewing on a score of 42. The leading scores made by the Wall street marksmen stood:

|                      | 200 yds. | 250 yds. | 300 yds. | Total. |
|----------------------|----------|----------|----------|--------|
| D. Chace, Jr.....    | 43       | 43       | 43       | 129    |
| C. Dewing.....       | 40       | 40       | 40       | 120    |
| J. W. Amory.....     | 36       | 36       | 36       | 108    |
| W. A. Blish.....     | 35       | 35       | 35       | 105    |
| W. H. Day.....       | 35       | 35       | 35       | 105    |

**THE AMERICAN TEAM OF 1877.**—The extra day's shooting on Tuesday last virtually concluded the competitions for places on the American team of 1877, and immediately at the finish of the work, the Committee appointed to conduct the matches, Gen. Wylie, Capt. Story and Col. Wingate, proceeded to canvass the scores, and out of the best 3 in 4 two-day competitions, named the first 6 men of the team as follows: Jewell, 1,220 in a possible 1,350; Allen, 1,219; Jackson, of Boston, 1,201; Weber, 1,195; Hyde, 1,191; Dakin, 1,187. These gentlemen, then, in session with the Committee, decided that it was unnecessary to go outside the present shooting ranks to fill up the team, and Bruce, 1,172, and Blydenburgh, 1,169, were put on in the 7th and 8th places, with Hepburn and Lamb as reserves.

The Amateur Club will be represented on the team by Allen, Jewell, Weber, and Hyde or Dakin as fourth man.

The team at once chose Gen. Thomas S. Dakin as the Captain, and fixed Tuesdays and Wednesdays as practice days. The organization was very harmonious, and the team gives promise of being a hard working one.

**RIFLE INSPECTOR'S QUALIFICATIONS.**—The learnedly-profound rifle editor of the *Herald*, who knows everything and a little more, delights to expound the law of military perfection to the national guardsmen, and recently has laid down at length what he considers the minimum amount of knowledge requisite to make a passable rifle inspector. Several members of that hard-worked class, mistaking the General's glittering generalities for a general order, at once penned their letters of resignations. He says:

The fact of being merely a good shot is only one qualification for an inspector or instructor; he should be thoroughly acquainted with the mechanism and nomenclature of the regulation rifle; he should know the theory and practice of ballistics, and be well posted in geometry, the nature and composition of gunpowder, and the figure, specific gravity, as well as the kind of alloy best adopted for projectiles, should be familiar to him. With these preliminary studies and a good knowledge of military matters in general, embracing elementary tactics and military administration, the rifle inspector and instructor would be a useful officer. He should establish classes for the theoretical and practical study of musketry. The brigade inspectors, under the superintendence of their division superiors, should carry on these schools for officers only, and the regimental instructors should do the same for the non-commissioned officers of the corps to which they are attached.

**A LETTER FROM SCOTLAND.**—The full text of the Scotch protest against the shooting of a British team in the International Match has been received. If the object is to draw out

a definite interpretation from the donors and present of the badge, which should act as a guide to the British men in case the trophy should fall into their hands, all such a statement should be put on record, and if this can be accomplished it will serve a useful end. However, a British-American match will surely go on if the British ever get here. The letter says:

67 WEST HEBERT STREET, Glasgow, July 25, 1877.

Geo. S. SCHMERHORN, Esq., Sec. N. R. A., New York.  
Dear Sir—I was duly favored with yours of April 8 last, containing copy of the Resolution of your Board of Directors against the competition for the American Centennial Trophy, and Lieut.-Col. Macdonald, Edinburgh, also forwarded to me your letter to him on the same subject. To permit my giving you the desired notice before June 1 (instead of waiting till our general annual meeting) issued a special circular to every member of our club, and the unanimous reply against Scotland competing this year, but many of them expressed hope that our council may arrange for Scotland competing in 1878.

After the full discussion, both prior to the match last year and the after at the meeting of the competing teams and others at Philadelphia, our club thought it settled beyond all doubt that under the constitution or rules of this match it is incompetent for a mixed (or we so call an Imperial British) team to compete. Neither by the charter of last year nor of this year is such a team invited, nor can it be given the required notice by the 1st of June last. The council of our club are therefore surprised to learn that the same parties who were not compete last year along with the Scotch and Irish are getting a so-called British team, and purpose competing this year. If our council thought it would not prejudice the rights and interests of Scotland they would have no objection to such a team competing, and would be glad to learn of their success; but they consider that if they consent a British team competing now, the right of Scotland hereafter to a team may be questioned, and in the event of the British being successful would be denied. They have instructed me on their behalf the party who accepted the invitation and sent a team for Scotland last year, and on behalf of that team and captain, to enter here a formal protest against any so-called British team being allowed to compete for the American Centennial Trophy. This trophy, our club consider, is presently held by the winning American team of year in trust, specially to carry out the intention of the donors—American people—as declared in the constitution and rules of match, which has been already interpreted and acted upon, and your association are acting in behalf of that team. They are therefore confident that this trust will be faithfully fulfilled, but considering strong and prejudiced views expressed by the promoters of the British team, our council consider it doubtful whether this trust would be partially executed by them should success impose it upon them.

To prevent any misunderstanding the council have instructed me to send a copy of this letter and protest to Sir Henry Hatfield, as captain of the proposed British team, and I shall feel obliged by your communicating it to the captain of the American team of last year.

I am, dear sir, yours faithfully, R. RENTON, Hon. Sec.

**WALPOLE AMATEUR RIFLE CLUB.**—As a couple of "spoon bricks" of what the Walpole men can do, a pair of cards of shooting by T. H. Gray, made on Aug. 4th, are received. Ten shots each distance. Score—50 at 800, 50, 900, 100 in the possible 100, and yet Mr. Gray is not of American team. Shall we always be provoked in our favor at Creedmoor by the receipt of these big scores from provinces?

**ZETTLER RIFLE CLUB—207 Bowery, July 31.**—Last week shoot for Bull's Eye Badge, presented by Mr. B. Zettler, shooting master of the club. Out of a possible forty bull-eyes, the following scores were made. Creedmoor target reduced to one inch eyes; distance, 100 feet:

Chas. Judson, 29; William Klein, 28; P. Fenning, John Dutil, 27; Max Engel, 26; D. Miller, 23; L. G. W. 23; Gus Schurman, 19; C. Zettler, 19; M. Dorrier, 10; L. Beck, 18; R. Zimmerman, 15; L. Bird, 15; J. Reyle, 10.

**ZETTLER'S GALLERY—Friday, Aug. 3.**—Seventh competition for "Centre Gold Medal." Won for the second time D. L. Beckwith. The medal has been won once by E. Fenning, M. Lennon, Wm. Brown, J. Lurch and J. Dutil. The badge will be shot for every Friday evening. Open to all. To be won three times by best average of centres (40 points).

**STRING SHOOTING.**—The twentieth annual meeting of National Rifle Club will be held at South Vernon, N. J., September 4th and 5th, 1877. A general invitation is extended to all interested in rifle shooting. Any one can become a member and entitled to all the privileges of the club by paying \$5.00 entrance fee to the match for club medal. The weight of rifle barrels being fifteen pounds, all over made the following odds:

| From 15 to 20 pounds | 1-4 inch to the pound for every 10 lbs. |
|----------------------|---|
| " 20 30 "            | 3-16 " " " " " "                        |
| " 30 40 "            | 1-16 " " " " " "                        |

First string will be shot Tuesday afternoon, second third strings on Wednesday. Distance, 40 rods. Time 10 minutes. JOHN WILLIAMSON, Pres. CHAS. C. HERBARD, Sec.

**THE CANADIAN-AMERICAN LONG RANGE MATCH.**—The Y. X. Amateur Club have requested the Hamilton Victoria Rifle Club to fix Saturday, Sept. 1st, as the date for the match between the two clubs. The New York team will consist of J. Hyde, Geiger, Allen, Hepburn, Bruce, Fulton and Col. Sandford as Captain. It will be determined by reaching the ground whether 6 or 8 will shoot. Members of the club are invited to accompany their team men on a trip.

**Ogdensburg, N. Y.**—A full score was made on our by Mr. James Ives, Wednesday, Aug. 8th, at 900 yards, giving him 223 out of a possible 225 at the three ranges made on three different days, viz.: July 24, 1,000 yards, Aug. 2, 800 yards, 75; Aug. 8, 900 yards, 75. Total, 223 out of 44 bull-eyes and a 3. Mr. Ives had no practice but dates, these being the three last times he has visited range. A CALLAGHAN, President O. G.

Mr. Ives ought by all means visit Creedmoor, and all before him.

**THE OSWEGO-BELLEVILLE MATCH.**—The match between the Forty-eighth regiment team, of Oswego, N. Y., and Forty-ninth regiment Hastings team, of Belleville, N. Y., was shot on the 9th and 11th inst., the first day's shooting on the range of the Belleville men, and the latter of Oswego range, and on the aggregate the American team once more victorious. The conditions of the match: Teams of six, seven shots at each range. The highest

KENTUCKY—Ashbury, Aug. 7.—Game will be scarce in this country the coming winter, with the exception of quail. They are abundant, there being double the number ever found before. They are now nearly grown. O'LEARY

PIGEON MATCHES.

CHALLENGE TO THE WORLD.

New York, Aug. 13, 1877.

FOR FOREST AND STREAM: DEAR SIR—I notice in your issue of Aug. 9 a notice to the effect that Mr. James Shaw, of Manchester, Eng., has issued a challenge to shoot at fifty pigeons against any man in the world for £500 a side. If Mr. Shaw's challenge is a bona fide one I accept it and have to-day deposited \$500 in the hands of the FOREST AND STREAM Publishing Co. I will allow Mr. Shaw £50 for expenses coming here, or if he will deposit a like amount in the hands of the Editor of *Bell's Life* and allow me £50 for expenses to England, I will shoot a match with him there; fifty birds, 1 oz. or 1 1/4 oz. shot, ordinary rules to govern. "Put up or shut up" is my motto. If not accepted by Mr. Shaw this is open to any man in the world.

A. H. BOGARDAUS.

CHAMPIONSHIP MEDAL.—The shoot for the Championship Medal of America, offered by Captain Bogardus, takes place to-day, at 10 A. M., at the Brooklyn Driving Park, Parkville, L. I. All the crack shots of the country are expected; among others Abe Kleisman, T. J. South, Miles Johnston and E. W. Tinker. Admission 50 cents; shooters free. Boats leave 23d street, North River; Piers No. 8 and 1 every hour, connecting with cars at Bay Ridge for Parkville, near the park, Coney Island horse cars, from Hamilton, Fulton and Catharine Ferries, direct to the park, leave every five minutes. Horse cars from Atlantic, Fulton and Wall street Ferries connecting with Prospect Park and Coney Island cars to Parkville Station.

MASSACHUSETTS—Worcester.—Sportsmen of this city (Spencer, Oakham and Rutland) had a field day with shot-guns and glass balls at Rutland, Aug. 2. Each competitor was allowed 40 shots in courses of 10, and the balls were given 18 yards rise. The scores were as follows:

| Worcester Club. |   |    |    |    |    |     |  |  |  |
|-----------------|---|----|----|----|----|-----|--|--|--|
| W S Perry       | 8 | 10 | 10 | 9  | 37 |     |  |  |  |

| J Needham       | 6 | 5  | 5  | 7  | 23 | 108 |  |  |  |

Whole number of balls 800, 505 of which were broken.

Worcester.—The second shooting tournament, under the auspices of the Fitchburg Sportsmen's Club, was held at the Fair Grounds, August 4th. The parties in the ball trap shooting, 10 balls at 30 yards; 10 yards apart, were secured by the following persons: First—\$10, W. S. Jones, of Ayer; Second—\$5, F. D. Whittaker, of Fitchburg; Third—\$3, S. W. Putnam, of Fitchburg; Fourth—\$2, George W. Cann, of Fitchburg. The ties for the fourth prize were shot off by Messrs. Cann, McKay and Wright. Mr. Cann broke three balls out of five, and secured the fourth prize. Messrs. John Choate, H. M. Sanders and E. T. Robie failed to break a ball, and the leather medal was awarded by lot. During the day 675 shots were fired at the glass balls, and 260 balls broken.

Fitchburg, Aug. 4.—The second shooting match of the Fitchburg Sportsmen's Club was held at the Fair Grounds with the following scores in the ball trap shooting, 10 balls at 30 yards, 10 yards apart: W. S. Jones, 10; F. D. Whittaker, 8; S. W. Putnam, 7; W. B. Haskell, G. W. Cann, B. W. McKay, H. Wright, 6 each; E. D. Stone, H. C. Patterson, D. S. Woodworth, J. E. Stanley, 5 each; C. E. Sheldon, H. C. Newell, W. H. Richardson, J. N. Dodge, 4 each; R. C. Hawkins, J. C. Howard, E. N. Choate, F. J. Noble, 3 each.

Prizes of \$10, \$5, \$3, and \$2 were awarded, G. W. Cann winning the fourth, shooting off in the tie.

RHODE ISLAND—Newport, Aug. 6.—Grounds of the Narragansett Gun Club, thirty yards rise, eighty yards fall. First Match—P. Lorillard, Jr., ten straight birds; P. Lorillard, Sr., five out of ten. Second Match—P. Lorillard, Jr., four out of five; P. Lorillard, Sr., three out of five. Third Match—Contestants tied on three birds each out of five; tie decided in favor of P. Lorillard, Sr.

PENNSYLVANIA—Petroleum Centre.—The "Fur, Fin and Feather" Club held a series of matches Aug. 4.

First match, 5 balls each, \$1 entrance, three prizes:

|             |   |            |   |
|-------------|---|------------|---|
| Van Syckle  | 5 | Ed Wilcox  | 3 |
| A J Lewis   | 6 | H G Davis  | 3 |
| W B Davis   | 5 | C H Burton | 3 |
| W T Lewis   | 6 | J W Frye   | 3 |
| H Metherell | 4 |            |   |

On ties Van Syckle and Davis divided first, H. Metherell won second, and H. G. Davis third.

Second match, 10 balls each, \$2 entrance.

|            |    |           |   |
|------------|----|-----------|---|
| Van Syckle | 10 | H G Davis | 8 |
| W B Davis  | 9  | H Green   | 8 |
| Ed Wilcox  | 8  | W T Lewis | 7 |
| A J Lewis  | 8  | C Burton  | 7 |

Van Syckle won first, Davis, Sr., second, and A. J. Lewis third.

Third match, 5 single pigeons, \$5 entrance, three prizes:

|           |   |           |   |
|-----------|---|-----------|---|
| H G Davis | 5 | H Scott   | 3 |
| W B Davis | 4 | J W Frye  | 3 |
| Wilcox    | 3 | A G Lewis | 2 |

H. G. Davis won first prize, W. B. Davis second, Wilcox and Scott dividing third.

Fourth match, 5 birds each, \$5 entrance.

|           |   |           |   |
|-----------|---|-----------|---|
| Wilcox    | 5 | J W Frye  | 4 |
| W B Davis | 5 | H G Davis | 3 |
| Scott     | 4 |           |   |

Davis, Sr., won first prize, Frye second, H. G. Davis third. Fifth match, 3 birds each, \$3 entrance, two prizes.

|           |   |            |   |
|-----------|---|------------|---|
| T G Davis | 3 | Davis, Sr. | 2 |
| Wilcox    | 2 | Scott      | 2 |
| Frye      | 2 | A J Lewis  | 2 |

H. G. Davis won first, Frye and Davis, Sr., divided second money.

Sixth match, 5 balls each, \$1 entrance.

|            |   |           |   |
|------------|---|-----------|---|
| Wilcox     | 5 | W T Lewis | 4 |
| Davis, Jr. | 5 | W B Davis | 4 |
| W B Davis  | 4 | C Betts   | 4 |
| Maloney    | 4 |           |   |

Wilcox and Davis divided first, A. J. Lewis won second.

Last match, 5 balls each, \$1 entrance.

|           |   |            |   |
|-----------|---|------------|---|
| A J Lewis | 5 | Davis, Jr. | 4 |
| W B Davis | 5 | W T Lewis  | 3 |
| Wilcox    | 4 | C Betts    | 3 |
| Maloney   | 4 |            |   |

A. J. Lewis and W. B. Davis divided first and second money.

Mansfield, Aug. 10.—Glass ball shoot; prize, a silver cup distance, 15 yards; 20 balls.

|           |    |            |    |
|-----------|----|------------|----|
| W S Bell  | 15 | Clark      | 14 |
| Greer     | 15 | Shaffer    | 12 |
| W C Gates | 15 | Proccwait  | 10 |
| R W Gates | 12 | Thorp      | 11 |
| Howe      | 14 | Gordon     | 14 |
| Frederick | 15 | J M Taylor | 16 |
| Foster    | 13 | S Taylor   | 14 |
| Perkins   | 15 | G Ward     | 13 |
| J J Jones | 11 | Drake      | 14 |
| Beaver    | 11 | J C Bedell | 15 |

Bedell and Ward shoot off their tie next week.

NEWPORT—Narragansett Gun Club Grounds, Aug. 13.—Match open to the Narragansett, Jerome Park, Philadelphia and Somerset gun clubs, for prize cup presented by Mr. J. G. Bennett; handicap distances, ten birds each, five traps, 80 yards fall; Hurlingham rules governing:

|                |         |   |   |   |   |   |   |    |
|----------------|---------|---|---|---|---|---|---|----|
| S H Robbins    | 23 yds. | 1 | 1 | 0 | 1 | 1 | 0 | —6 |
| J N Howard     | 23 1/2  | 1 | 1 | 0 | 1 | 1 | 1 | —9 |
| M Van Buren    | 29      | 1 | 1 | 0 | 1 | 1 | 1 | —9 |
| R W Davis      | 29      | 1 | 0 | 0 | 1 | 1 | 1 | —8 |
| August Belmont | 27      | 1 | 0 | 1 | 1 | 1 | 1 | —9 |
| E H Totten     | 27      | 0 | 1 | 0 | 1 | 1 | 0 | —4 |
| Perry Belmont  | 28      | 1 | 1 | 1 | 0 | 1 | 1 | —9 |
| J Balfour      | 28      | 0 | 1 | 1 | 1 | 1 | 1 | —9 |
| Carroll Bryce  | 29      | 0 | 0 | 0 | 0 | 0 | 0 | —0 |
| C A Longfellow | 27 1/2  | 0 | 1 | 1 | 1 | 0 | 0 | —5 |

C. B. Moore, 7; F. B. Sands, 1; Lawrence Curtis, 7; Francis Van Buren, 7; Walter Beaden, 4; W. W. Dudas, 3; G. D. B. Wagstaff, 7; S. S. Howard, 5; Pierre Lorillard, Jr., 5; Donnell Swan, 2. Ties on nine—Howard, 2; Davis, 3; Belmont, 1; Balfour, 1.

We present our readers this week with a cut of the elegant silver cup above mentioned, which was presented to the Narragansett Gun Club by Mr. James Gordon Bennett. This cup was manufactured to order by Messrs. Tiffany & Co., and is of sterling silver, the main part of the surface being "satin" finished or frosted. The vase is classic in outline, flaring toward the top, which is open. At either side is a finely modeled pigeon, hanging by the feet, dead. The front is adorned with an effigy in relief of a marksman with gun in hand, and so perfectly is this figure executed that every thread of the garments is seen as plainly as in reality, and even the texture of the skin is easily discernible. On the reverse appears the name BENNETT CUP in raised block letters, which, being burnished, stands out in striking relief against the frosted surface. Around the lower part of the vase is a wide border of laurel, which, with the sculptured figures, is tinted in a peculiar and beautiful manner. The height, including the ebony base on which it stands, is 20 inches.

NEW YORK—Oxford.—The sporting club had a trial of skill with shot guns Aug. 6th, shooting from three traps, fifteen shots, for prizes of \$5, \$3 and \$2. The result, was as follows:—Alvin K. Bowdish, 11; W. S. Forrest, 10; James Forrest, 9; Albert Appleby, 7; J. W. Humphrey, 6; S. Joslin, 6; H. Pope, 6.

LONG ISLAND GUN CLUB.—Semi-monthly sweepstake shoot, Dexter Park, L. I. Classified sweepstakes; \$2 entry, three birds each, 25 yards rise, 80 yards boundary. This had eleven shooters; \$10 to first, \$7 to second, \$5 to third; ties miss and go out. The club rules to govern.

|          |   |   |    |                      |   |   |    |
|----------|---|---|----|----------------------|---|---|----|
| Hatton   | 1 | 1 | —4 | Brown (second money) | 1 | 0 | —2 |
| Reddin   | 1 | 1 | —4 | Thompson             | 1 | 0 | —1 |
| Langate  | 1 | 1 | —3 | Birditt              | 0 | 0 | —1 |
| Williams | 1 | 1 | —3 | Fuller               | 1 | 0 | —1 |
| Langate  | 1 | 1 | —3 |                      |   |   |    |

Hatton and Reddin divided first money, and Thompson, Burditt and Fuller divided third money.

Handicap sweepstakes; \$2 entry; \$10 to first, \$7 to second, \$5 to third; eleven competitors, three birds each, 80 yards boundary; ties miss and go out.

|          |         |   |   |    |    |        |         |   |   |    |    |

Fourth match: Smith, Wells, Nicholson, Jones and Kirkman tied on 5; Wells and Kirkman tied on 4 birds at 26 yards; shoot off won by Wells.

TIFFANY & CO., Silversmiths, Jewelers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their Timing Watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. TIFFANY & CO.

are also the agents in America for Messrs. PATEK, PHILIPPE & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York.

**INSURED.**—A family up town owned a dog. The father told his boy one morning to take the dog to the pound and have it drowned. The little fellow loved the dog, and, going to his mother, prevaricated, saying that his father had told him to get \$2 and register the animal. She gave him the money, and he went to the clerk's office and got a license, after which he went to his father's store, and, showing the license, triumphantly exclaimed, "Pa, I've got the dog's life insured."—*Cleveland Plaindealer.*

Aug 9

### Wanted.

## A Partner Wanted in Florida.

A situation as full partner in an establishment of forwarding Florida oranges. Market all secured; the only work is receiving, counting, boxing and shipping. The business pays from 100 to 200 per cent. profit. The party must not expect to hunt or fish but a small part of the time, although fish and game are abundant. To a person slightly ailing the position would be very desirable, as the work is light. The location is on the gulf coast, just below Cedar Keys. The business would pay for two others, as we have to hire two or three (as last year); but each must have at least \$1,000 cash in hand to take with us immediately on notice of shipment. Slight drafts will be honored in Boston. Everything responsible and of the highest order, and connected with an old established house in Boston controlling the best of the trade. Address, immediately, P. O. Box 400, Putnam, Conn.

## Sportsmen's Routes.

## TO SPORTSMEN:

## THE PENNSYLVANIA R.R. CO.

Respectfully invite attention to the  
Superior Facilities

afforded by their lines for reaching most of the FISHING PAIRS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT PORTS, avoid the difficulties and dangers of jacking-point, while the excellent STOCK TO RUN OVER THE smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

The lines of  
Pennsylvania Railroad Company

also reach the best localities for  
GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principal cities to KANE, RENOVIA, BEDFORD, GREENSBORO, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also, to  
TUCKERTON, BEACH HAVEN CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

L. P. FARMER, Gen'l Pass. Agent,  
FRANK THOMSON, Gen'l Manager, feb 17-17

NEW HAVEN, HARTFORD, SPRINGFIELD, White Mountains, Mount Mansfield, Lakes Memphremagog and Willoughby, Montreal and Quebec. Shortest, quickest and most pleasant route. Steamers C. H. NORTON and CENTINELA leave Pier 25 East River, daily (Sundays excepted) at 5 P. M. (23d St., E. R., 3:15 P. M.) and 11 P. M., connecting with trains on wharf at New Haven for above and intermediate places.

Passengers taking 11 P. M. steamer (except Saturdays and Sundays) can reach White Mountain, Lakes, etc. next afternoon.

Tickets sold and baggage checked at No. 944 Broadway, New York, and No. 4 Court Street, Brooklyn. Full particulars at office on Pier.

RICHARD PECK, Supt.

Agencies in the principal cities in the United States.

## Laffin & Rand Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

### Orange Lightning Powder.

No. 1 to 7, strongest and cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

### Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6½ lbs. each, and canisters of 1 and 5 lbs. each.

### Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, Fg, FFG and PFG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6½ lbs., and in canisters of 1 lb. and ½ lb. All of the above give high velocities and less recoil than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."  
BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS, ALL ITALY POWDER of all kinds on hand and made to order.  
Safety Fuse, Frictional and Platinum Fuses.

Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

## HAZARD POWDER CO. MANUFACTURERS OF GUNPOWDER.

**Hazard's "Electric Powder."**  
Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

**Hazard's "American Sporting."**  
Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6½ lb. kegs. Burns rapidly and clean, for upland prairie shooting. Well adapted to shot-guns.

**Hazard's "Duck Shooting."**  
Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting. It tanks any other brand, and it is equally serviceable for muzzle or breech-loaders.

**Hazard's "Kentucky Rifle."**  
FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12½ and 6½ lbs., and cans of 1 lb. FFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

88 WALL STREET, NEW YORK.

## THE New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD  
For all off-hand shooting at short and long ranges. Unsurpassed for cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequalled for rapid firing, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address

CARL DITTMAR, NEPONSET, MASS.

NEW YORK, July 10, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Please say, for the information of some of my friends who may be misled by current statements, that I am still on the same powder for all out-door shooting, which I have used for several years past, never having risked the use of the nitrate powders except when shooting in a confined space in-doors, when the smoke from any regular powder would produce a small rather offensive to some people, and cause somewhat greater obstruction to vision.

CAPT. A. H. BOGARDUS,  
Champion Wing Shot of the World.

## Gunpowder.

## Warren Powder Mills,

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

SPORTING BRANDS—Eureka, Continental, "Border Rifle," Snap-Shot, and Warren Sporting Cannon and Musket, U. S. Standard. The above can be had of the dealers, or at wholesale at the office, 27 DOANE STREET, BOSTON, MASS., and of the agents, JOHN P. LOVELL & SONS, corner of Washington, Cornhill and Rattle street, Boston, Mass. Jy19

## Publications.

NOW READY,  
THE

## Sportsman's Gazetteer

AND

## GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS,

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM;" AUTHOR OF THE

"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen: It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the *Habitat* and breeding season of each—a most valuable contribution to science.

It describes 231 varieties of edible fish alone, that may be taken with the hook; 50 varieties of ducks, 50 varieties of snipe or waterfowl, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been prepared by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repainting, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

## Sportsmen's Goods.

BOUDREN'S PATENT COMBINATION

## Jack, Dash and Fishing

LAMP,

For NIGHT HUNTING Deer and other animals, SPARING FISH. Indispensable on any Boating, Yachting or Camping Trip.

**AWARDED BOTH MEDAL AND DIPLOMA AT CENTENNIAL EXHIBITION.**

**PRICE, \$6.**

Circulars sent on application. Send postal order or check to

**C. J. STODDARD & CO.,**

Lock-Box 192, Washington, D. C.

LIBERAL DISCOUNT TO THE TRADE.

## **HUBER & MERWIN'S CHAMPION BALL TRAP.**

We call the attention of the fraternity to the above trap, claiming to be the *plus ultra*. It combines compactness with durability, and is arranged, by a swivel on the bed-plate, to throw a ball in any direction or at any elevation unknown to the shooter, a screen preventing his seeing the direction in which the trap is set.  
The spring, as the cat will show, is made of a steel rod or wire, bent spirally at the point of attachment, thus receiving the concussion its entire length, and preventing breakage.

FOR SALE BY

**BARTON & CO., Sole Agents,**

337 BROADWAY, NEW YORK.

This certifies that I have used every trap in market, and find the CHAMPION BALL TRAP, for durability and perfection of its operation, superior to them all, and take pleasure in recommending the "Champion" to sporting clubs and my friends. (Signed)  
IRA A. PAINE.

**Painting.**

## **PAINTING.**

EVERY ONE THEIR OWN PAINTER.

50 Per Cent. Saved.

We are manufacturing a very fine Pure Ready-mixed Paint, mixed in such a manner that any ordinary stable or farm hand can make as good a job painting as a painter can with paint mixed in the old way. This is because our paint does not set quick, and thus shows marks of the brush. We sell it lower than materials can be bought in the ordinary way, and pay freight in certain sized orders.  
Any gentleman wishing to paint up his buildings at small expense had better write, and have sent free our book.

Address 260 Front street,  
**INGERSOLL PAINT WORKS.**

## W. &amp; C. SCOTT &amp; SONS.

TRIPLEX.

marked the PREMIER QUALITY

[Extract from FOREST AND STREAM, New York, December 26, 1876, Contributed by one of the Judges of  
Awards of Guns at the Centennial.]

"This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and most  
rapidly secure the favor of all who test its merits."

**COMPENSATING LUMP.** Strongly recommended. It is invaluable, and should be ordered on  
every gun. Costs about \$10 extra. Choke-bored, medium or full. Our guns to be had of the principal  
dealers in the trade only.

**PREMIER GUN WORKS, Birmingham, England.**

## Paper and Metallic Shells

## Breech-Loading Shot Guns,

Manufactured by the

**UNION METALLIC CARTRIDGE CO.,**  
**BRIDGEPORT, CONN.**

THE STURTEVANT SHELLS are the easiest reloaded.  
Do not have to unscrew the head nor use an awl to remove  
the exploded caps. THE PATENT MOVABLE ANVILS,  
made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with  
Hobbs' patent waterproof primers, never miss fire, and are  
highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great  
outlay for improved materials, and machinery made ex-  
pressly for the purpose, we can now warrant our BROWN  
PAPER SHELLS equal to any imported. They are sure  
fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for  
the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers.

## "St. Louis Conical Base Paper Shell."

Having made important improvements in our Shell, we  
can safely recommend them as equal, if not superior, in  
quality to any Paper Shell manufactured in this country or  
in Europe.

Among the advantages claimed for these Shells, are: A  
saving of 25 per cent. in the use of powder; also the great  
decrease in recoil. The sizes made are 10-2½, 12-2½,  
and 3 inches; No. 12-2½, 2½, and 2½ inches. Longer  
than the standard.

Shells will be made at extra cost. They are not mailable. Sample, 100, sent by express on receipt of \$1.15  
for No. 12; \$1.20 for No. 10.  
Factory and office, No. 2,329 De Kalb street, St. Louis, Mo.

### THE WOODLAND.

Selected.

Yon woodland, like the human mind,  
Hath many a phase of dark and light;  
Now dim with shadows wandering blind,  
Now radiant with fair shapes of light;  
They softly come, they softly go,  
Capricious as the vagrant wind,—  
Nature's vague thoughts in gloom or glow,  
That leave no airiest trace behind.

No trace, no trace; yet wherefore thus  
Do shade and beam our spirits stir?  
Ah! Nature may be cold to us,  
But we are strangely moved by her!

The wild bird's strain, the breezy spray,  
Each hour with sure earth-changes rife,  
Hint more than all the sages say,  
Or poets sing, of death, and life!

For, truths half drawn from Nature's breast,  
Through subtlest types of form and tone,  
O weigh what man at most hath guessed.  
— While heeding his own heart alone.

And midway betwixt heaven and us  
Stands Nature, in her fadeless grace,  
Still pointing to our Father's house,  
His glory on her mystic face

PAUL H. HAYNE.

### A Moose Hunt in Canada.

OVERTAKEN by the snowstorm, Nimrod and I were tramping our weary way homeward. We had spent the whole of the day wandering over the hills in search of deer sign, but had not struck the trail of any animal larger than a fox, and at last had given up hunting, the very dogs partaking of our disgust, and keeping so unpleasantly close to heel as to tread upon our snowshoes and add to our discomfort by giving us an occasional header in a snow-drift. Gladly we welcomed the shelter of Nimrod's house, and retired to his "den," where, under a cloud of smoke of our own raising, we sat before a roaring fire lamenting our ill success.

In its way, Nimrod's den was well worthy the attention of an antiquary. Almost every quarter of the globe had contributed to its adornment. Heads and antlers of the hart, roe, wild beast, springbok, blesbok, *et id genus omne*, assagais, shields, boomerangs, etc., presented by a sporting friend in South Africa, formed one of the principal attractions. These were ably supported by antlers of the moose, caribou and deer, the product of his own prowess. Conspicuously over the fire-place a huge moose with antediluvian horns, pushed his head through the wall and surveyed the inmates of the room with sinister eye, so perfectly had the taxidermist performed his work. But the gem of the room was undoubtedly a pair of caribou antlers, placed immediately over the door, perfect in form and measuring nearly, if not quite, six feet from tip to tip.

Festooned upon the walls, and variously distributed about the room were fowling-pieces, rifles, pistols, swords and weapons of the chase innumerable. Of pistols alone there were eleven different kinds, ranging from the old blunderbuss and saw-handle down to the modern seven-shooter. To complete the picture, and make one feel perfectly at ease, there stood in one corner of the room a keg of C. & P., partly used and entirely unprotected from a spark from pipes or fire! Under the effects of the soothing pipe and a moderate quantum of the genial mountain dew, we were gradually, thawing out and getting over our disappointment, when we saw the tall form of our Indian friend Sebatis stalking across the floor.

For an instant he surveyed us and our surroundings with a comprehensive glance that seemed to comprehend the situation, then appropriating a comfortable seat at the fireside, coolly pulled out his tobacco pouch, and began to fill his pipe, and then to light it and smoke in the most provoking manner, as if he had been spending a social evening with us, and every topic of conversation had been exhausted. As the readers of FOREST AND STREAM have already made the acquaintance of Sebatis (Vol. 7, p. 84) no further introduction is necessary, but while he is enjoying his pipe I shall avail myself of the opportunity to relate one or two anecdotes concerning him, which even he, with all his Indian stoicism, would enjoy as well as any one. Like all of his tribe he has a way of putting the cart before the horse, which renders some of his sayings

irresistibly comical. For instance: once when he and his father were out late one fall, trapping sable mink, shooting musquash (muskrats), etc., he happened upon a river driver's camp, where after he was made welcome one of the party said:

"Well, Sebatis my boy, what's the news?"  
"Twenty-four musquash kill'm my father last night," replied the imperturbable Sebatis.

During my long acquaintance with him I can only recall one occasion upon which he at once and completely lost his stoical self-possession; but I must add that he would have been more than mortal had he retained it under the trying circumstances in which he was placed. It happened thus: E—, an English friend of mine, took a great fancy to Sebatis and wished to give him some token thereof at parting. Of the manifold possessions of E—, two articles were especially coveted by Sebatis. One was a common red clay Virginia pipe with a reed stem, worth altogether about ten cents; the other, an English-made pea-jacket of very stout serviceable cloth, very little the worse for wear, and worth some twenty dollars. Although I have said that each of these articles was coveted by Sebatis, it must be understood at the same time, that had he been called upon to make a choice, he would have selected the pea-jacket without a moment's hesitation, and it was the bare possibility of being presented with the pipe instead of the coat, which caused him in the most shameful manner to lose his habitual presence of mind. E— being about to return to England, Sebatis called one day to say good-bye to him. As we entered the room where Sebatis sat waiting for us, E— said:

"Oh, about giving Sebatis something, which do you think I had better give him, that pipe or the pea-jacket, you know he admired both of them immensely?"

"Perhaps it would be as well to leave the choice to him," I answered.

"How excessively stupid of me, of course it would. I say, Sebatis," he exclaimed, "which would you rather have as a present, that pipe or the pea-jacket? You know you thought both of them awful jolly."

The expression which passed over Sebatis' face was ludicrous beyond description; the idea that any one in their senses could for a moment hesitate as to which he would rather have, the coat or the pipe, was utterly incomprehensible to him, and in his struggle to gain utterance he incoherently muttered in reply:

"Pipe, coat, pipe!"

"Oh, so you would rather have the pipe would you?" said E—. "Well, it's a very jolly pipe, Sebatis; I'll go and get it for you."

For a moment poor Sebatis seemed paralyzed with horror and disappointment. Then with a powerful effort, mastering his emotion sufficiently to regain the power of speech, he frantically gesticulated toward the doorway through which E— had just made his exit, and cried to me in the most beseeching manner:

"Tell'm coat, tell'm coat, quick!"

I "told him coat," much to the amusement of E—, and Sebatis departed the happy possessor of both pipe and coat.

To resume: Fortunately for our patience, even the taciturnity of an Indian has its limits, and just as we were on the borders of despair, the oracle spoke.

"I come all way Big Lake to-day myself, everywhere find'em plenty sign moose; one yard, three moose; then little ways find'em sign old bull moose. S'pose we go hunt'em to-morrow, I come daylight."

At the conclusion of the sentence he took his departure without more ado. Evidently he did not seem to have any doubts about our eagerness for the fray, as he did not wait for any reply; and a sly twinkle in his eyes he departed convinced that he was not unacquainted with our bad luck in deer hunting.

An Indian's power of gaining information without asking questions is truly marvelous. A couple of rifles standing in a corner of the room, and our snow-shoes bearing the traces of recent use, furnished evidence of our having been out; and the snow-white coats of the hounds without any blood stains would indicate that we had not been successful. In a few moments we were completely roused from our lethargy, cleaning rifles, drying moccasins and attending to various matters important for the comfort of a well appointed hunt. Eleven

o'clock found everything packed and strapped in readiness for an early start. Nimrod was early astir, and roused me at daylight.

At breakfast we were honored with the company of Sebatis, who made his appearance accoutred for the hunt. He was accompanied by his brother Swarsin and his nephew little Joe, a noble looking Indian of gigantic stature. Breakfast over, we found the pony at the door, stowed with our packs and commissariat, and surrounded by the usual crowd of admirers.

The hounds, our old friends "Mitchiess," "Matagins," "Meyahlip" and "Obieekmo," with the addition of "Vic," a recent purchase of Nimrod's, were in high spirits. They had kept up an incessant baying since daylight, and instinctively seemed to "scent the battle from afar."

At Murdoch's camp, near McDougall Lake, we were delayed for several hours by the temporary loss of two hounds, they having strayed off into the woods. Little Joe set off in pursuit, but did not succeed in recovering the truants until mid-day; when, all being in order again, we strapped on our snowshoes, and after a five-mile tramp reached our hunting-grounds. As the day was on the wane, Sebatis advised the postponement of any search for the moose until the next morning. His opinion being law in cases of this kind, we devoted the afternoon to building a camp and cutting firewood. Among our provisions was a quantity of sausages, and upon their being produced in order to have some cooked for dinner they were the source of much amusement. The Indians had never seen anything of the kind, and surveyed them with curious glances, then surrounded the pile and began quite an animated discussion as to what they were, fish, flesh or fowl.

"What you call'em?" said Sebatis, taking hold of some links, and gradually raising them from the pile until he had a string a couple of feet long pendant from his hand; "little Joe he say g—s, Injuns he don't eat'em."

It required some address to disabuse little Joe of his idea. We desired Sebatis to cook some of them, and as the savory odor saluted their olfactory they began to change their opinion, and, after tasting them, were enthusiastic in their praise, and ever after as long as a sausage remained in the locker, Sebatis, acting as cook, inquired:

"Well, what cook now, s'pose sausages?"

At day break we were off in gay spirits to beat up the quarters of the moose.

The snow-shoeing was as bad as it could be—a light fall of snow on a very slippery crust, in most places strong enough to bear one's weight. It would not have been easy to decide which was the most difficult, going up hill or coming down; but the latter, I think, was entitled to the palm.

We were standing upon the crest of a high hill, and it was necessary that we should descend to the valley with little noise, or without any if possible, as we feared to alarm the moose before we were ready for them. The approved plan for going down hill upon an icy crust is to squat down upon one's snowshoes, place the rifle (butt end foremost) under the left arm, leaving the right free to fend off—and away you go. If there were no obstacle the way, it would be comparatively easy; but to steer past tree trunks and other minor objects at the rate of ten miles an hour, without knocking one's brains out, is a feat, requiring much skill.

Nimrod led the way gallantly, followed, and by some means passed him. All went merrily until half way down, I collided with a tree and fell over backward. Nimrod ran into me, pitched over on his face, and rose, with the blood streaming from his nose. A noise like distant thunder announced the approach of little Joe. In vain we shook our fists at him—to stop was impossible; so we made frantic efforts and scrambled out of his way, and he passed like an avalanche. Nimrod and I tried it again, and arrived at the foot of the hill without any further mishap. Sebatis had got down quietly, and was justly indignant at our want of skill.

"You mak'em too much noise!" he said severely, "Scar'em moose; no use try hunt'em now."

We managed to pacify him, promised better fashions and resumed our march.

Just as we were beginning the ascent of another hill, we struck the well defined trail of some large animal.

"Moose he mak'em," whispered Sebatis; "by'em-by we find'em yard."

Presently the trail was joined by another, and a little further on it bore the appearance of a well-trodden path, branching off in all directions and leading one to suppose that he had suddenly come upon a cattle yard in the depths of the forest.

"Moose yard now," said Sebatis in a low tone. "I tak'em houn's, go ahead; you fix'em rifle, everything, by'em-by moose come."

"Don't you think we had better separate?" said Nimrod.

"Sebatis, post the others in good places, then you go around to the other end of the yard. I'll take the hounds in on this trail."

"Very well," replied Sebatis in a tone of quiet sarcasm. "I sit on log; you tak'em houn's, make plenty noise, slide down hill snow-shoes, scar'em moose pretty bad, then we all go camp get supper."

Although Sebatis and Nimrod were excellent friends, they occasionally had these little differences, owing to Nimrod's desire to assume a prominent place in the hunt. On this occasion I sided with Sebatis, got him in good humor, and he started off with the hounds as he first proposed. We then took our position on the outskirts of the moose yard. Presently the baying of the hounds, desultory at first but soon gaining volume, assured us that the moose had started. With nerves at their utmost tension, we stood in momentary expectation of seeing a moose break cover. But soon, the cry of the hounds growing fainter, we learned that the quarry had taken some other direction.

"Moose gone right cross country!" exclaimed Sebatis as he came up on the run. "Only chance now, cut'em off."

"Swarsin, you and little Doc watch'em yard; may be two, three moose there," he continued. "Me, other two men go big lake."

And off started Sebatis, Nimrod and I, and a right jolly time we had of it; now toiling up a steep ascent, assisting ourselves as best we could by twig or branch, sometimes missing our hold and sliding half way down the hill and, by way of variety, getting a fall on the hard crust. Encouraged by the baying of the hounds, on we hurried, charging windfalls which, on other occasions, would have appeared insurmountable to snow-shoes.

"Big lake, now," remarked Sebatis. "Moose he don't lik'em ice—slip, slip all time. Spose he go on lake, sartin houn's ketch'em."

We could now hear the hounds barking furiously, and we judged that they had the moose at bay, which proved to be the fact. About half way across the lake a large cow moose stood at bay, surrounded by the hounds, not one of which had the pluck to go in in the face of the determined front she presented to all assailants. Matters had evidently reached a dead lock when we appeared upon the scene of action. The moment the moose attempted to move on the hounds closed in and, attacking her savagely, she was compelled to turn and show front, which on the slippery ice was no easy matter, and she was well aware of the fact that if she went down it was all over with her.

"I go help'em houn's," said Sebatis, slipping quickly out of his snow-shoes.

He was off like an arrow, and before Nimrod and I could get out of our snow-shoes he had covered half the distance between ourselves and where the scrimmage was going on between the hounds and moose. As soon as the moose caught sight of him she broke away from the hounds, and dashed forward to meet the new and more dangerous foe. It was a moment of peril to Sebatis, as neither Nimrod nor I could aid him, the direction taken by the moose keeping the former in range and preventing our firing.

Sebatis was an old hand at the business, and took the matter coolly; dropping on one knee, he brought up his rifle, waited until the moose was within twenty yards of him, then fired. For an instant the moose faltered and tottered as if she would go down, then, gathering strength, made a desperate charge. It was her last effort, for on reaching Sebatis, her ability to injure him was gone; she, however, managed to carry him down with her as she fell.

The dogs now rushed in, and over they rolled, slipped, slid and struggled on the ice—Indian, dogs and moose all mixed up together. Sebatis tried his best to beat off the hounds, who, determined not to be driven off, were tearing away at the dying moose.

Nimrod and I now joined in the fray, and drove off the hounds, much to the relief of Sebatis. The latter presented a most deplorable appearance, his face and hands smeared with blood, and his clothing hanging in shreds. Loud were his denunciations of the hounds.

"Me no lik'em houn's," he said in a tone of disgust, "houn's great fool, he bit'em moose, bit'em Injun all same."

He then skinned and quartered the moose, and with our assistance dragged the meat to the shore, where we hurried it into the snow.

It was now about 3 P. M., and our camp being some two hours distant, we decided to return to it, and defer starting the bull moose until the next day. On our way back we passed the moose yard, but did not see anything of Swarsin and little Joe.

"Two Injun tracks go that way," said Sebatis, pointing toward a ravine.

After studying the country for a few moments, he continued: "Sartin one moose go that way, Injuns he chase 'em that one."

"Where do you suppose the bull moose is," said Nimrod, "you know he started out of the yard with the others?"

"I guess he smok'em pipe somewheres," replied Sebatis, ironically. "Bull moose lik'em pipe pretty well."

Dreading a resumption of hostilities between these two inveterate sharpshooters, I hurried them off on the return march to the camp.

As we tramped along, an old cock grouse fluttered up out of the snow and alighted on a tree near by. Sebatis blazed away at him, but to his intense chagrin, made a clean miss.

"Your gun is crooked," observed Nimrod, as he knocked the grouse over.

"Yes, I know," assented Sebatis, I have'm made crooked, purpose shoot'em moose round tree; very good gun shoot'em moose, very bad gun shoot'em partridge."

Then raising his head and listening attentively, he said:

"Two Injuns come."

Presently we heard the sound of approaching snow-shoes, and were joined by Swarsin and the redoubtable little Joe. They were carrying the quarters of a small-sized moose.

"Aha, boys," exclaimed Nimrod, "so you've killed a moose."

"No," replied Swarsin, "whiteman kill'em."

"How was that?" pursued Nimrod.

"We wit'em long time moose yard by'em by tired, then we go hunt'em somewhere, find'em trail young moose, hunt'em long ways. By'em by come on lake see'em white man stand big hole on brook—moose dead."

"We tell'em Injun chase'em—Injun's moose."

"He say, whiteman kill'em—whiteman's moose."

"We tell'em, White man half, Injun half."

"He say, all right, you tak'em half."

"How," continued Nimrod, "did the white man happen to kill the moose?"

"Always ice on brook, not strong. Moose he break in brook, lumberman camp handy, he come, knock'em moose on head, axe."

We were now within two miles of camp, where we arrived just about dark, all in good spirits with the result of our day's hunt.

We had a rich royal dinner of moose steak, broiled grouse, and to which we brought the hunter's relish, an excellent appetite, and did ample justice thereto, and then pipes and coffee were the order of the day. Later we brewed a bowl of the "barley bree," which served as a nightcap, then rolled ourselves in our blankets and turned in.

The next morning we were all afoot bright and early. The prospects for another successful day were good; the snow-shoeing improved, and the hounds were in excellent spirits.

As we expected to find the bull moose plucky and any amount of run in him, we prepared ourselves accordingly. Sebatis led the way toward the ground where he had marked the sign, and to our intense delight we soon found unmistakable evidence of the moose being in our immediate vicinity.

On the southern hillside, a short distance from the yard, we found trees bent over and stripped of the bark, broken boughs, and presently, best sign of all, a fresh trail on the new fallen snow. The hounds, full of life, scented the trail, threw up their heads and made the old woods echo again with their eager baying. To restrain them was impossible, so Sebatis slipped them and away they went at a gallop on the fresh scent.

For an instant, fearing a check, we listened with bated breath to their deep mouthed bayings, but still on they went louder and more furious. Their eagerness seemed infectious, for, without any previous consultation, white men and Indians set off in a mad burst at a break-neck pace on the trail. One moment jostling each other and tumbling in the snow, then up and off again in the most reckless manner, our only care being to keep our rifles dry. Presently we were brought to a standstill by a total cessation of the baying of the hounds. For a moment they were at fault, but we knew that the trail was too fresh to be lost for any length of time, and that the hounds had probably strayed off on an old trail, which conjecture was verified in a few moments by their again giving tongue more furiously than ever. Having learned that "the more haste the less speed" was especially applicable to snow-shoeing, we followed at a more leisurely pace, which would, however, avail us more in the long chase which we had in prospect. In offset to the latter, we had the assurance that the hard crust would tell more or less on the speed of the moose, as he would be badly cut thereby, and would more than likely turn at bay.

"Old bull moose he run jus' like devil," said Sebatis. "Spore we don't cut him off he go all way St. Johns River."

Not relishing the prospect of a fifty or sixty-mile run, we desired Sebatis to use all the means possible to cut him off. The latter then availing himself of his thorough knowledge of the country and the habits of the moose, led us by a short cut to the banks of the river, where, not sorry for the chance of regaining our wind, we awaited the result of Sebatis' tactics. As more than twenty minutes had elapsed since we ceased to hear the hounds, we began to have serious misgivings as to whether we should hear them again that day. We did not give expression to our doubts for fear of offending Sebatis, and it was well we did not, for presently that worthy startled us by exclaiming:

"Hark! houn's come!"

For a moment we thought he was mistaken; then faintly the music of their cry saluted our ears from far away over the hills. Gradually and steadily approaching the river, on they came, louder and deeper, nearer and nearer, until the whole pack, close at hand, with eager bayings cheered us on to action. Off we dashed at a run, along the dangerous icy mazes of the river, and suddenly came in sight of the hounds at fault. The moose had crossed the river. Cowed by the angry stream, dashing along in fretful haste through its ice-bound channels, now breaking into frozen spray over some hidden ledge of rock, then following on a black, silent stream, between walls of shelving ice, the hounds stood "slivering on the brink."

As always, our brave Sebatis was equal to the occasion. Without a moment's delay, the strong and well directed blows of his ever ready axe were laid at the root of a tall fir tree, which reared its towering head close by the bank, and in almost as little time as the telling of it takes the river was bridged and hunters and hounds safely landed on the opposite bank. The hounds picked up the trail again, and, refreshed by the temporary check, started off at a pace which promised, ere long, to overhaul the moose. Sebatis and Nimrod followed the hounds, leaving Swarsin, little Joe and I to guard the river, as there was every probability of the moose returning to the water again. For a weary hour we paced up and down the bank of the river, amusing ourselves as best we could. Our patience being well nigh exhausted, we had quite made up our minds that Nimrod and Sebatis would have all the glory of killing the moose, and had just pulled out our pipes to have a smoke, when—joyful sound!—we heard the hounds. To pocket our pipes, slip into our snow-shoes, and prepare for action was but the work of a moment, and, quick as we were, we were not one minute too soon. Swarsin and I ran down to a bend in the river where the water was not so deep. We had not time to select a position before little Joe cried to us:

"Look out! moose come!"

Turning round, we saw the huge animal trotting along toward the river, with the foam dropping from his mouth, his legs badly cut by the crust, and showing signs of being pretty badly used up. Just as he got opposite me I fired at his shoulder—evidently a hit—but he did not slacken his pace or take any more notice of it than if he had been struck with a snowball. Swarsin raised him off, and having a splendid chance for a shot, raised his rifle and fired. He made an excellent shot—with the "butt" of his gun, for simultaneously with the terrific explosion, he fell over backward. He believed in putting in plenty of powder, and was literally "hoist with his own petard." Little Joe ran up at the double quick, and fired, too far back. The ball went through the moose's neck. On dashed the moose, and I feared we might lose him, when up came the gallant hounds to the rescue. Just in time. The moose was in the river, when the hounds running at him, he turned at bay. At best the moose has not much to boast of in the way of personal beauty. In the present instance, fired out and infuriated by his wounds, he looked a fiend incarnate, and one look at his savage, bloodshot eyes warned us that we had des-

perate work on hand for both hunters and hounds. The latter were gradually closing around the moose, but he had chosen an admirable position for defense—his rear protected by the river, and his front very dangerous ground to manoeuvre on, being a mass of treacherous shell ice through which the hounds were constantly breaking.

I was in the act of loading, when a warning cry came from Swarsin: "Look out, moose goin' fight savage."

Savage indeed was his charge, scattering the hounds right and left. With one tremendous kick poor "Oblecknio" was knocked into a mangled mass. Another kick and Mitch-ss hobbled past with a broken leg. The rest of the hounds gave ground right and left, and on came the infuriated animal. Swarsin skillfully dodged him, little Joe sprang up a tree—snow-shoes and all. I tried my best to get out of his way, but, in an instant I found myself on my back in the snow with a bruised shoulder, and the moose was just turning to wreak his vengeance on me, when, fortunately, Nimrod and Sebatis entered an appearance. Nimrod let him have it full in the chest. Sebatis blazed away at his broadside, the three remaining hounds joined in, and the moose retreated in good order to his former position, blood streaming from his mouth and nose, but apparently with any amount of fight left in him.

Nimrod and Sebatis now had it all to themselves. The tumble in the snow had rendered my rifle useless. Swarsin, in his famous first shot, had smashed his rifle, and little Joe, having descended from the tree, was wandering about, apparently laboring under a temporary aberration of mind.

Nimrod, having reloaded, walked up to within fifteen yards of the moose, and was just in the act of firing, when he slipped on the treacherous shell ice and the ball passed harmlessly over the moose. It had the effect, however, of rousing his fury again, and he made a desperate charge. Poor Matagius caught it this time, and came whimpering to me with a broken rib. I had no time to comfort him, for the moose was in the midst of us, scattering us right and left.

Sebatis coolly stood his ground, and, when the moose was a few yards distant, sent a ball crashing through his head, and down went the huge animal, much to the relief of all parties interested.

"More'n twenty years," said Sebatis, "I hunt'em moose, but I never se'em one fight so savage. Sartin I 'fraid he kill somebody."

The following day was devoted to getting the venison to camp, and early next morning we started homeward, dragging our spoils behind us.

PASSAMAQUODDY.

## HABITS OF DEER.

### SOME SUGGESTIONS TO HUNTERS.

Now, my brave youths, Strid'p for the chase, give all your souls to joy!

FROM time to time I have noticed in your welcome sheets accounts of deer hunting in various parts of the country. I think I am not mistaken when I say that you have many readers who are unacquainted with the habits of the deer, and more especially his habits as known to the hunter. Perhaps a few facts upon this subject may be of some interest. It has been my good fortune to spend considerable time in hunting deer (*Cervus virginianus*), generally with hounds, but also still-hunting, and watching the licks occasionally. Our deer rarely weigh over two hundred pounds; generally not over one hundred and fifty. The horns of the buck are thought by many to be a sure indication of his age, i. e., his life numbers as many years as he has points upon them. Extensive observation and inquiry have led me to believe this an uncertain sign. His first year, the buck has two small, sharp points. It is now termed a "spike" buck. In his second year the horns fork, having two points to each beam, and hence he is called a "forked-horn" buck. After the second year the horns seem to fail as an age indicator. In his third year he may have three prongs, but quite often has four or five, and after this it is impossible to be sure of the age of an untamed deer. Certain it is that the size of the buck does not increase in proportion with the size of the horns. I saw a buck with twelve points (an unusual number) and he was hardly as large as the average four-prong. The largest deer I ever saw had but six points. It is known to few people that the bucks shed their horns every year, about the first week in January. It seems strange that the horns are rarely ever found in the woods, even where the deer are very abundant. Perhaps they seek some secret spot in which to deposit the horns. In the spring the horns grow out in a soft state, and are covered over with a hairy-like skin, which is called "velvet." The horns are very handsome when in this state, and may be preserved, when not too soft, by soaking them in lye. After the horns have obtained their full growth, and before that time, the bucks seek the highest points they can find in their range. Here they lie about in the sun, the hot rays of which harden the horns. As their horns harden the deer rub them continually against the trees to get the velvet off. An old buck presents a queer appearance with strips of "velvet" waving around his head as he dashes along before the hounds. The horns are quite hard by October.

Deer are most abundant wherever food is plentiful; like the wild turkey, they follow the mast. When acorns are plentiful the deer live on them most of the winter. Mosses, roots, leaves and berries form a good part of their food. In the summer they feed mostly on grass whenever they can find grazing ground. When there comes a deep snow in winter, covering almost everything which might serve for food, the deer feed upon laurel leaves, about the only thing green above ground. They are thought to be the only animal to which laurel is not poisonous. Hunters attribute this to the fact that deer have no gall.

The meet of a deer which has lived upon laurel for any length of time is poisonous to man and dog; though I have never known it to be fatal in its effects. During the rutting season the bucks get very bold, and their fierce contests for supremacy often terminate in death. The skeletons of two deer, the horns being interlocked, are not infrequently found by hunters, while the appearance of the battle ground bears testimony of a savage struggle. At this season the neck of the buck is swollen to a thickness out of all proportion. Strange as it may seem, the spike buck is invariably the victor in his contests with old deer; his sharp, straight horns being much more effective than the large, branching horns of an old buck. When the moon becomes full in November, say old hunters, the rutting season is at its height, and the does are being chased mercilessly through the range by their ungallant pursuers. The still-hunter takes advantage of this strange piece of nature by watching the crossings.

The deer have their regular crossings when chasing each other just the same as when they are being chased by hounds. The still-hunter takes his station at some crossing which is

## Fish Culture.

## A MICHIGAN FISH COMMISSIONER ON HIS TRAVELS.

THE Michigan Fish Commission—whose humble servant I chance to be—very kindly granted me a few days vacation. I have just spent them in satisfying what has long been a deferred wish and hope, to-wit: a visit to my *scaly* brethren to the west of me, in their own "castles" and amid the implements and surroundings of their fish industrial labors. The choice I made and the manner of my vacation has left not a solitary regret. I account it my vacation of vacations, to be remembered and cherished so long as kindly courtesy and true friendship are the symbols, ay, the essence, of manhood and nobility. Do you think your readers (some of them very likely of the fastidious sect) would relish a "free and easy" discourse concerning some of the fishermen I impressed into my vacation, with now and then a passing allusion to some of the noteworthy objects interviewed during my journey? Well, July 12th, with the odious carpet-bag in hand, I put out. Dr. W. A. Pratt, Commissioner of Illinois, being my nearest of fish-ial fish neighbor, I made straight for him. I found him some two miles from Elgin, on a large and beautiful farm, with improvements of the most approved patent, testifying the thrifty and progressive farmer. His elegant home, embowered with fruit tree, and shrub and plant and flower, receives additional embellishment by a large Trout Park, across the road from his house, in which not only sport the world-famed *Salmo fontinalis*, but also many other gaily tinted and graceful denizens of the brook and the pond. In the inclosure graze deer and elk. Rabbit and other game, *Fere natura*, I saw bounding over heath and brake and up the craggy slopes, while springs, with full head, gush forth, warbling a delicious music from the several ravines. The highest knoll is marked by an observatory, from the summit of which a dull vision even cannot fail to take in a landscape of rarest outline and beauty. At your feet is the busy and beautiful city of Elgin, while far away stretch the fertile acres of the valley of the Fox. But, in the midst of all this luxuriousness of hearth and home and deft surroundings, I detected one great need. Now, if you are a Yankee, you can guess it. All I saw seemed to say, "too good, too much for one." It should be, and I dreamed in my friend's chamber that night that erst while it would be shared and enjoyed by *two*. Fair Home, of—

"Two souls with but a single thought,  
Two hearts that beat as one."

From Elgin the doctor became my *compagnon de voyage*. After a delightful cup of coffee, we checked for Madison, Wis., the home of Mr. Welch, President of the Fish Commission. Arriving at Madison, we found our friend, Mr. Welch, busily engaged in the trial of an important suit before the Supreme Court, and from the ease with which he chopped logic, slung evidence, and cited authority to Bench and Bar in the advocacy of his case, we felt compelled to esteem him no less an athlete in the arena of legal Titans than he is a confessed expert in the arts and love of pisciculture. Too engaged in his suit to be of us, he ordered his carriage to the Park Hotel for our use. Kind soul! Who but a grand fisherman, in the hurly-burly of a lawsuit, would have thought of that! The carriage did a splendid business that morning. Its occupants visited every main avenue, cross street, and almost every cranny of the capital of the Badgers, enjoying the whole immensely. Madison, girt by Lakes Mendota and Monona, with Waubesa, Kegonsa and Wingra as bright connecting links, can boast a plat on which to found a city, in contrast with which no town or city the country over can justly claim a site superior. It is more than beautiful. With the beautiful it unites the picturesque and the grand. Mr. W., being relieved from court, now joined us, and ordering a spick and span establishment from the livery, he straightened the ribbons for the State Hatchery, some four miles away. Wisconsin's Commissioner can drive too!

Wisconsin has achieved an excellent start in her fish works. She already has two large and well appointed hatcheries, a commodious and handsomely constructed superintendent's house, with barn and outhouses, several large ponds and fish preserves, and others still in process of erection. In one thing particularly is she ahead of nearly all the fish States. She is wise and rich enough to hold the fee simple of the land upon which the springs are situated and the improvements made. She has forty acres, all fenced, all being improved, and all paid for. No burly landlord comes to her Commission with itching palm for tithe or rent. Her State Fishery is on as independent a basis as are her other State institutions. That we enjoyed our acquaintance with Mr. Welch does not half express it. The following is our unanimous *verdict*: "A gentleman of the most approved brand. A live fish man—intelligent, outspoken, with 'nary' a concealment where duty and conviction are the spurs to action; as 'sassy' to his foes as he is genial and affable to his friends."

From Madison we ticketed for St. Paul, where reside two of Minnesota's Fish Commissioners. *En route*, about one hour's ride from Madison, our train, seemingly awakening all the echoes of Pluto's realm, came thundering down upon Devil's Lake. Why in the world it should go by the name of Devil's Lake I can't understand. There is nothing I could discern in the slightest degree Satanic about it. On the contrary, it is grand and sublime almost beyond conception. Devil's Lake, indeed! Better named Olympus. Jupiter

reaching water the deer wades in slowly, stops to drink and looks around for the most inviting chance of escape. Of course this is not the case when the dogs are close behind. The beautiful bright eye of this animal does not seem to be of much service in detecting enemies, at least its enemies among mankind. If the watcher be perfectly motionless he will not be discovered by the fleeing game. Let him but move though—almost a wink will betray him. I have known of deer jumping almost over watchers without seeming to be aware of their presence. I was once watching, with several others, at the edge of a river. We were all seated on one log, with nothing between us and the river except a fire, which watchers may always be allowed in winter. We had not been seated very long before we heard the hounds coming over the mountain, and presently an old doe jumped into the water opposite us. I supposed she would detect us at once, for there was nothing whatever to prevent her—nothing between us but the water. She never turned an inch from her course, but came directly toward us as though she intended walking over fire and all. When she had come to within a few steps of us I involuntarily let my hand fall to its place on the gun barrel, and that instant she was off like a flash: not fast enough, however, for the bullet.

Deer frequently seek safety by swimming down stream for a long distance. They will often sink themselves along the bank, where there is overhanging brush, with nothing but the nose above water. Such tactics put the hounds to a strong test. Some hounds seem to follow the water trail with as much ease as they would a land trail. I remember one in particular, said to have followed a deer in this manner for a mile! swimming over the same course the deer had gone an hour before. A strange phenomenon is this: A deer when killed in winter will float like a cork, whereas in summer it would sink. Old hunters maintain that the deer, in choosing his course of flight, will bear up stream in summer, down stream in winter. My observation has led me to believe this to be a mistake. Who would seek real sport must follow the hounds and hear

SYCAMORE.

For Forest and Stream and Rod and Gun.

## WAS IT A WATERSPOUT?

WE were sinking a shaft on the Old Guard lode, Tom and I. The claim lay on the south slope of Silver Slope. Our windlass was set just at the head of Belmont canyon, and about one hundred feet above the level of its highest wash. The view from the mouth of our shaft embraced the Belmont Mountain on the west and southwest, the canyon due south, and to the east, and south an almost endless vista of short canyons, broken peaks and rocky hills, stretching out past Coso toward the Panamint Mountains. About three miles from its head, in the Flat, the canyon forked, one prong going almost due west, the other obliquing southeast. The fork was caused by a range of red hills running nearly due north and south, and headed by a rugged peak abutting on the canyon, forcing its division into the forks before mentioned, and opposing an impassable barrier to its direct progress. In fact, any one could see at a glance that that hill was bluffing the canyon. One hot summer afternoon I was lazily gadding out rock at the bottom of the hole, then about seventeen feet deep. A rope hung down the shaft with a hitch on the windlass, so a fellow could shin up in case of Indians making it too hot for the windlass man to haul him out of the hole. I heard a curious muttering, muffled, rumbling sound, and Tom, poking his head around the windlass, yelled, "Earthquake!" and I just boomed up that rope like a lizard climbing a hot rock. I remember thinking that the walls of the shaft might come together and kinder bury a feller, if I didn't hurry. But it wasn't an earthquake. Where we were standing, and in every direction but south, the sun was shining brightly, the air clear, and the sky free from clouds. To the southward, on a prolongation of the line of the canyon, and apparently ten or fifteen miles distant, was a dense bank of cloud reaching from the hills to heavens, and seemingly a mile in width. Out of this cloud came the noises I heard—noises as of mountains falling. The centre of the cloud was black as night, the outer edges like showers of rain in veils of mist. The cloud was in rapid motion toward us, and we heard with increasing distinctness the roaring of the wind which drove it. Where we were there was a strange and unquiet sense of stillness, a deadness, so to speak, in the air; the horrible noises of the cloud and wind seemed strangely out of place as they hurried to us through the intervening strata of dead air. We were afraid, and wanted to run, but where? The cloud was moving with such speed that there was no time for flight. Hardly a minute had elapsed since I left the shaft, and the cloud, then so distant, swept up and enveloped the red hill in the forks of the canyon. There were no longer noises in waves; we stood walled in by sound—sound had seized on space, was shutting out air, and paling the sunlight. We were helpless, too nerveless even to think, except in a dazed, confused way; we were under an influence before which our strength was as nothing—in the shadow of a death for which not even preparation was possible. Men can prepare for death in many forms and brace themselves to meet it without visible shrinking; but what will, can, meet the first shock of earthquake without feeling the presence of omnipotent power, and quailing with a sense of mortal weakness? With us the often-felt fear of the earthquake came back a thousand times intensified. Fortunately our suspense would, in any event, be of brief duration. On the red hill the cloud halted for a moment, then swept into the west fork of the canyon, and following its course, disappeared around the Belmont mountain. The feeling of relief when we saw it go was intense, and we felt not a bit ashamed of our fear when we looked again at the red hill. Although very steep on all sides, and an almost perpendicular wall on its canyon front (before the coming of the storm cloud its top was comparatively smooth and afforded sufficient soil for the support of several goodly tamarack and quite a grove of pinyon pine), after the passage of the cloud, not a tree was left on the hill, two or three were lying and hanging, stripped of limbs and foliage, half way down the rocky eastern slope—Tom said, as he turned our field glass to take in the top of the hill, "like the bodies of drowned men left stranded by a tide." Poor hill! It was washed, gullied, swept, gashed, and torn, its once bold front so changed and sorry looking that not even its oldest friend would have recognized the mountain owning the country, tree-crested, and looking down on the canyon of the morning.

EL CAZADOR.

—Nearly all the taxes in Adair County, Kentucky, were this year paid in scalps of foxes, the State allowing a bounty of one dollar per scalp.

used, and awaits a shot. If he choose to let the doe run by it is all right, for he will not have long to wait before the buck will come on her track, as true as the hound. It is just as well, however, to try a shot at the doe, for unless the buck be very close behind her he won't stop at the report of the gun.

A wounded buck, during the rutting season, is a dangerous customer. I once saw a tired old seven-prong fellow turn upon his pursuer (who was mounted) and chase him for quite a distance: lunging at the horse every bound.

The continual rutting during the rutting season soon takes the fat off, and by the middle of December they are generally rather poor. Deer generally stay in the thickest part of the woods; that is, where the undergrowth is most dense and affords them a constant hiding-place, for they are extremely shy. For this reason the still-hunter rarely commences his winter shooting until after the frost has killed the leaves, and they fall off, leaving the woods more open, and affording a better chance for discovering the game, as well as for shooting. If any one thinks there is sport or excitement about this method of deer hunting, I wish him joy of it. I can see but little sport in tramping through the mountains, over sticks and stumps, from morning until night. And yet a man who understands still-hunting will kill a great many deer during the winter. When there is snow on the ground is the best time to still-hunt. The deer are not so apt to travel far, and can be easily tracked. Lick-watching is the least exciting of all the ways in which the deer is hunted. Dry licks (where the deer go to lick the ground for salt) are of two kinds—natural and artificial. The former is some piece of ground where the deer have paved down to a clay surface. The latter is made by digging a hole in the ground about a foot in depth, and then filling it with alternate layers of dirt and salt, packed in tight. The deer soon finds the place, and will use it. The fact is, a deer will use any place where there is salt, as cattle lots, etc. I went one day with a gentleman to salt some cattle he had on a mountain farm. He told me that the deer which ranged in the woods adjacent knew as well when he called his cattle for salt as the cattle themselves did. The cattle were called, and we went on to the next field. Returning in a short while, I saw an old doe quietly licking the salt in among the cattle. Dry licks are used most at night, a short time after dark.

The usual drinking-places of deer are not properly licks, but we have water licks. Wherever deer can find sulphur water they use it in preference to any other. All the most famous licks I have ever known or heard of belonged to this class. The deer not only drink the water, but will stand for a long time with their mouths thrust into it, sucking it up and then letting it run out again. The watcher must have a blind. Its distance from the lick depends on circumstances, though it should always be close to the lick if it is to be watched after dark. The best time to watch a water lick is a few hours before sundown during the hot days of July and August. Just after a shower of rain is a good time for either a wet or dry lick. Deer are extremely cautious about coming into a lick. They generally circle around, winding for danger. I remember an old buck which circled around a lick I was watching for several hours. I could hear a stick crack now and then, but couldn't make out the game. At last an old negro guide, who was in the blind with me, exclaimed in an undertone, "Good God! yonder's an old buck big as a mule." Upon looking up I saw a sleek old buck standing high up on an adjacent ridge. He was tossing his head up and down, snuffing the air. I knew he had scented us, and in an instant he was off, leaving us nothing but the recollection of his shrill snort. When alarmed the deer snorts in a peculiar way, making a noise similar to that made by little boys placing their hands together and whistling through their thumbs. Deer quit using licks upon very little cause, as if a limb of some tree close by be bent down or broken, or a few grains of powder be scattered close by. Once spoiled, it is a long time before a lick will be used again.

For genuine sport, hunting deer with hounds is the best way of all. By October the weather is cool enough for the hounds and hunter alike, but the season may begin earlier. The starter should be on the hunting ground at an early hour, especially in dry weather; if the dogs are let go at daylight so much the better. Once in the proper place he lets go his dogs. They know well what they are to do, and are soon circling for a trail.

"If some staunch hound, with his authentic voice,  
Avow the recent trail, the jostling tribe  
Attend his call, then with one mutual cry  
The welcome news confirm, and echoing hills  
Repeat the pleasing tale."

Some hounds can wind the game, while others stick to the track, but in running and trailing the best dog to start deer that I have ever seen was a bob-tailed terrier. He seemed to wind them farther off than a hound could. Young dogs invariably depend on the old ones in an emergency. Indeed I have seen a whole pack stand around watching an old deer dog, and waiting for him to cry off.

An old deer hound rarely takes the back track. It surely is not altogether instinct, for only old dogs can be depended upon to take the right end of a cold track, and the more they have hunted the better they seem to know. A good hound can run a very old trail. I have seen a trail at least a day old carried along at a pretty good pace. The starter, if he be experienced, can generally tell what kind of a deer is up. If it be a small deer, or a doe and fawn, the running will be done in circles for some time. If a large or fat deer, the course will be straight for water; especially if it be some distance from the starting ground. A large deer seldom does any up-hill running, and if he be pursued closely he is sure to stick to down grades. Of a wet day deer will keep in the woods a long time, for the water from the brush keeps them cool. The stand in the woods is generally situated upon some leading ridge, for deer always follow the ridges, seldom running across them. A good shot gun (and it is a rare one that will shoot buckshot well) is the best weapon for a stand in the brush. The watcher needs only to stand perfectly still; no matter if the deer does see him, it will not change its course unless it is very close to him. If the dogs are not very close it is an easy matter to stop the deer by a bleat, or any word spoken quickly, but the shot must follow the bleat, for the deer will not tarry long. Unless shot in a vital spot a deer will travel a long ways with a bullet or load of buckshot in him. I have seen them shot through and through the body with a whole load of buckshot, bleeding at every step, and yet they would travel for miles. If shot in the body it must be close behind the shoulder to be fatal. If the hunter sees the deer slap his tail "hard down" and run with redoubled speed, he may be sure he has struck it somewhere. If it leave the ridge and make for a hollow it must be badly wounded. The river and lake afford the best places for watching.

Just as deer have certain ground they run over when chased, so have they certain points at which they take to water. Upon

might thunder from its lofty beach summits and its rock-cleft ridges, inspiring all the lesser deities to a superadded awe. The placid little lake, shimmering at your feet, of all the objects within the visual range, is the only one that awakes a feeling of security and repose. The over-arching, rock-crested hills, beneath which this exquisitely beautiful sheet of water is so nearly engulfed, appear as if they might, upon the slightest provocation, rain down upon you a most relentless shower of stones. Since seeing Devil's Lake I confess to a clearer conception of the poet's vivid verse—

"Alps on Alps—crags on crags—  
Where leaps the live thunder," etc.;

for it seemed to me, anywhere about Devil's Lake, thunder would have a spring-board to start from, and hence a most excellent chance to do some very superior leaping!

Saturday morning found us in St. Paul, enjoying the acquaintance of R. O. Sweeney and William Golcher, Minnesota's most intelligent and wide-awake Fish Commissioners. Fish Minnesota is yet young in deeds, but strong in faith; her fish farm, in extent and in value, is hardly excelled by any State of the Union. To our newly found friends we are indebted for the most enjoyable of all our well enjoyed days. Upon their invitation, and seated by their side in an easy barouche, with just "room for four and no more," we made the trip from St. Paul to Minneapolis, and a jolly trip, too, it was. The ride takes in a very beautiful view of the Mississippi River and Valley, the State University and grounds, and the mineral springs and caves of suburban Minneapolis. In full view from almost any point of the city, can be seen the mill and factory-belabored Falls of St. Anthony, grand and beautiful still, though industrial art and trade have done their level best to contract the tide and lessen the roar of the waters. Returning by another route, you take in the Falls of Minnehaha—falls which, once seen, will not quickly fade from the memory. Further along on the road you come upon old Fort Snelling, one of the boldest and most unique sites in all Jonathan's dominions. Indeed, I know of no drive of equal extent (only twenty-four miles out and back) where are seen so many objects of natural and historical interest. The Falls of St. Anthony, or the Falls of Minnehaha, or old Fort Snelling, any one of them is richly worth a special visit. Now, having gained the northern arc of our "swing around the circle," we fell back in good order by Mississippi packet line steamer to Winona, thence by rail to Chicago. There, reluctantly shaking the Doctor good-bye, I was compelled to do the rest of my vacation alone.

From Chicago I ticketed via Clinton to Anamosa, Iowa, to redeem my long and often made promise with Mr. F. B. Shaw, Commissioner and Superintendent of the Iowa fisheries. It was ever so good a thing to be beneath his hospitable roof, a welcome recipient of the rare bounty and tender kindness and thoughtfulness of his excellent lady and two daughters. Iowa ranks among the foremost of the fish States, and for this proud rank she is indebted almost exclusively to the arduous and persevering efforts of her Commissioner and Superintendent. This I know, for I have watched the inception and the growth of her artificial fisheries with almost a filial interest, having been for many years a resident of the State. The Superintendent's never-say-die kind of pluck—his great resources in contrivance of ways and means, as well as efficiency of execution—his rare tact and judgment in rallying to his use those peculiar aids and influences so essential to give State fish culture a good send off, all were needed to achieve the grand results that must be credited to the Hawkeye State. I visited with Mr. Shaw the State Hatchery, located some three or four miles from Anamosa, and was surprised to find so large a hatchery and one so complete in all its appointments and apparatus. All the space is utilized, and the water, although not a very large supply, yet, under his arrangement of troughs, boxes and screens, seems ample for the attainment of all the results sought. I very much question if any State can show as fine samples of lake trout, salmon and other varieties as can the State of Iowa. The whole upper story of the fishery is occupied by Mr. G. F. Slocum and lady, the overseers of the fishery, and on the occasion of our visit, all the rooms evinced the order, the neatness and the varied accomplishments of the *guide* wife and perfect housekeeper. From Anamosa, I drifted to Council Bluffs, and Omaha—thence to Lincoln, gathering up as I journeyed what I could of Nebraska and her water resources. An effort was made last winter to induce the Legislature to make an appropriation and to establish a fish commission. But I was told by parties zealous in the fish enterprise that the effort came too late. They say another year you may score Nebraska with the fish States—so mote it be. From Lincoln I passed through Kansas, thence to Kansas City, Mo. Kansas enlisted with the fish States last winter, and has an energetic working commission. Missouri last winter passed an act creating a State Fish Commission, but the Governor has not yet publicly announced the members who are to constitute the Board.

And now, right here, comes in the *comico-serious* part of my vacation. While the guest of my brother, Wm. W. Jerome, of Kansas City, I, with other transients, became mob-bound. Having a ticket that read plainly enough St. Louis & Chicago, yet for three days I was the prisoner of as scurvy and contemptible a bailiff—a boy mob—as ever held a person in du-rance ville. Despairing of reaching home via St. Louis, I turned to a northern outlet via Omaha, Council Bluffs, Cedar Rapids and Clinton, the longest way being for the nonce the safest if not the shortest! I was an eye-witness of "the strike," it was called, in Kansas City, and a more ridicu-

lous farce, take it all in all, it were hard to conceive of. In-timidation stalked forth at noon-day, was self-created king and ruled the beautiful city of fair women and reputed brave men as with a rod of iron. Bravado and cheek stopped the trains, closed elevators and packing houses, turned back street-cars, shut up brick-yards, drove off men pounding stone for the repair of streets, and put its begrimed fingers on all the pulses of industry, of trade and of commerce; and, when the authorities dared to peep from their holes, so frightened were they, they seemed to have pulled the holes in after them. They saw all this was the work of a lot of rag-and-tag boys, swaggering about with laths and cornstalks—boys, too, none too large nor none too good for the across-the-knee sort of treatment by another class of strikers, their mothers. But the farce, like every yelping and whining canine, had its day, and the citizens awoke to wonder and disgust that they, for a single hour even, had tolerated so high-handed and so disgusting a farce. Thus began and so ended the "big strike," which I saw, and to part of which I was a victim. For courtesies extended to myself and to Dr. Pratt allow me to express my thanks to the Great Northwestern Railroad. I declare it to be, from personal knowledge, both a *gamey* and a *game* road, ramifying all the country north and west of Chicago, having a road bed of over 2,000 miles. On it are coaches of the latest and easiest pattern, tastefully furnished—with a time-table you can "lie to"—and equipped with officers and employees genial, courteous and attentive to every want and comfort. "Long may she wave," with the happy experience of none other than "ten strikes."

Geo. H. Jerome.

NEW HAMPSHIRE.—The State hatching house is to be built at Livermore Falls. It is to be a plain wooden structure, one story high, 40x20, and the site is near a trout pond, which is fed by living springs.

Nashua, N. H., Aug. 25.—Our Fish and Game Club is flourishing. It numbers fifty wide-awake sportsmen, to which number it is limited. We have placed five thousand salmon fry (and locked) in ponds in this vicinity this season, and are daily expecting a lot of black bass from the State Commissioners to stock others with. The Commissioners of Massachusetts having stocked the head waters of the Nashua River (which flows through this place, and where it also empties into the Merrimac) with salmon shad and black bass, the dam across the river at this place is to be reconstructed with a fishway attached. In another spring or so we hope to see salmon and shad, as of yore, swimming past our very doors. Thirty years ago shad were plenty with us, and salmon were frequently taken; our river seemed to be one of their favorite haunts.

A. W. G.

## Natural History.

### THE GREAT CRESTED FLYCATCHER.

*Myiarchus crinitus*—CALAMIS.

EDITOR FOREST AND STREAM:

I TAKE this opportunity of writing concerning so rare and little known a bird—that is, to us in the New England States. In Mr. Samuel's work entitled, "Birds of New England," I find a very short account of this species of flycatcher, merely the description of the bird, its nest and eggs. Wilson speaks of it as only a bird of Pennsylvania and the Southern States. Having had a very good chance of observing the habits of this bird pretty closely for a month or so, I should like to make them known to the readers of the FOREST AND STREAM interested in natural history.

The first knowledge I had that these birds were in the vicinity was their loud screaming, which was kept up mostly in the morning. In the afternoon it was not so frequent. Going out one day, I observed them flying from tree to tree near the house, and seemingly very restless. There were three of them, probably two males and a female. After they had mated, I did not hear them so much, and supposed they had left for some other place. Soon, however, I found I was mistaken, for one day, walking through the orchard, I saw them flying about a tree with a hollow limb. I think they must have been looking for some suitable place while I missed them. The hole they had selected was about fifteen feet from the ground, and about a foot and a half deep. The nest, now in my possession, is large and rather loosely put together, composed of dry grass and large feathers, and lined with fragments of wasps' nests and cows' hair. I obtained with the nest two eggs. While the nest was being built, the birds were very quiet, and once when I started the female from it, she flew silently to the woods without uttering a cry. When the eggs were laid, they manifested much alarm, alighting on the tree and screaming loudly. I took this nest and eggs, supposing, of course, the birds would leave the place altogether. The next morning, however, I heard them screaming far back in the woods, but did not trouble them. A week or so after I happened to be walking along the road, and saw one of these birds under a pine tree, picking up the pine needles. I watched her, and soon she flew over into an old orchard and lit just above a hole in a tree. I waited until she had gone into her nest and left her mouthful. On climbing up and looking into the hole, I saw the foundation of a nest constructed from straw and needles of the pine. Two days afterward I again returned, and found the nest more completed with the former materials; a bunch of cow's hair and a large piece of wasp's nest lying in the middle. I am inclined to think that their object is to get together a sufficient quantity of materials to raise their nest from the dampness of decayed wood, always composing the bottom of a natural hollow. I did not go to this nest for a week, fearing that the birds might desert. When I looked in again, I found the nest completely finished, the lining consisting of a large and small snake skin, which completely hid everything else. I am unable to account for this in any other way (for it is a marked peculiarity) except by thinking that it is either because the bird prefers the glossy smoothness for her eggs and young, or that it may serve as a guardian while she is absent to frighten away marauders. The next time I visited the nest it contained two eggs, of a dull cream color, thickly scratched with purple lines of various tints, as if done with a pen. I tried the experiment of leaving pieces of wasp's nest around on the tree, thinking that she might take them; but they were always untouched. Evidently they thought their own materials the safest and best. Wilson remarks that this bird is little known on account of its solitary habits. But the birds I had watched and noticed lived very near the houses, and were not at all shy. There is one fact that I will close with, namely, the posi-

tion of the last nest. It was placed half way up a hollow running nearly the whole length of the tree; the nest had no rat on. It is a wonder to me how they managed it, and stand so securely as it did. I hope this will be of benefit to your readers desirous to ascertain something concerning this bird, I will close.

G. G. II., Jr.

[We are glad to receive the above, and thank our youthful contributor. The great crested fly-catcher *Myiarchus crinitus* was once considered rare, but is now a common species during spring and summer in the Eastern States.—Ed.]

THE SEWELLEL OR SHOWTL.

THIS strange little creature, which is known to the scientific world as the *Aplodontia leporina*, is one of the most curious specimens of the rodent family. Its position in Natural History is not yet defined as distinctly as one would wish, owing to its isolation and the fact that it seems to be a connecting link between the beavers and the spermophiles or ground squirrels. Its scientific name is derived from *aplo-*, simple, and *odons*, a tooth, owing to its having rootless molar teeth. Sir John Richardson has proved it to be a new genus of the sub-family Castorina, though it is strongly allied with the squirrel family in many of its habits. Being the only member of its genus and species yet discovered, it possesses some interest for naturalists, as it is with, I believe, one exception, the only example of this paucity of variety in the animal kingdom. Its range is very limited, being found only in that region of Northwestern America lying between the Blue Mountains in Washington Territory and the Pacific Ocean, while its southern wandering is checked by the northern boundaries of California. Even in that comparatively small area it occupies only isolated spots, generally on some sandy prairie, where roots are plentiful and water is convenient. Being an inveterate miner, it is constantly engaged in digging itself new home, felling young trees, or rooting up edible shrubs. The country around a showtl village is generally one mass of dead vegetation, for the residents will leave nothing green standing if it is of any use to them, or furnishes exercise to their claws. This little animal, when full grown, averages about fourteen inches in length and six in height, and both sexes look exactly alike, except that the female is a little smaller. It has scarcely any tail, the cauda being less than an inch in length. The muzzle is large and round; the head full; the ears are short, quite round, and not unlike those of the genus *homo*, and are covered on both sides with fine soft hair. The eyes, which are very small and of a dark brown color, are situated midway between the nose and ears. The incisor teeth, like those of all rodents, are exceedingly sharp; the legs are short and stout; the feet broad and strong; and the nails, which are long, curved and thick, are powerful mining implements. The flesh is quite savory, and is highly esteemed by both Indians and the pugnacious badgers. The latter are its greatest foes, and two of them will destroy a colony of showtl in about as short a time as a couple of terriers would a nest of rats. The fur, which is thick and tolerably fine, is of a reddish brown hue outside, but the inner approaches a bluish gray at the base. It was formerly used for the manufacture of clothing by the Indians, but since the introduction of cotton goods among them it has been rejected. The men have a tradition that it was the first animal endowed with life, and the source whence sprung their race, and on this account they pretend to entertain respect for it, but that never exceeds mere expediency. As an anomaly in natural history the animal is attractive, but its utility in nature is a subject for conjecture.

J. M. MURPHY.

AMERICAN GROUSE.—In the August number of *Scribner's Monthly* there occurs an article by Mr. Charles E. Whitehead on the Grouse of America. He makes a variety of assertions, which manifest a profound ignorance of the nature and habits of the birds he describes. I shall only, however, notice what he says of ruffed grouse.

"In the breeding season the cocks select some hollow tree and, strutting up and down, beat it with their wings. If the bird succeeds in finding a log perfectly hollow and well placed, his tattoo of welcome can be heard a mile. It has the same accelerated pace, and is about the same duration as the call of the raccoon, and is heard only in the day, as the raccoon is only heard at night."

Now, passing over the fact that Mr. Whitehead evidently never heard the sharp, wild cry of the raccoon, his assertions concerning the habits of the ruffed grouse are most extraordinary. He must surely have obtained his ideas from some rustic youth who, no doubt, also directed Mr. W. to look for woodcock on the dead trees of the neighboring forest.

The drumming of the ruffed grouse is not confined to the breeding season, as Mr. W. would lead us to suppose. Indeed, every sportsman knows that from September on through the golden autumnal days, the woods are often alive with drummers, and not until the cold and storms of winter approach do they desert from their favorite pastime. That it is a "love call" is all moonshine.

The statement of our author as to the hollow log is too ab-

to treat seriously. Imagine a grouse examining with each log in his accustomed haunts, until he finds one that is "perfectly hollow," which he may beat with his wings. Bah! The fact is, a grouse will drum wherever he pleases to be. I have repeatedly crawled within ten yards of grouse as they were drumming. I have found them on old pines or stump, or poles not more than six inches in diameter, and on the bare side of a knoll. As to how the peculiar sound is made, the exact method was described some years since in the *ROD AND GUN*, by a writer whose name I forget. The bird does not strike the log with his wings. He strikes out, bends the air, at first slowly, but rapidly increasing the blows until the eye cannot follow the swift vibrations. Every time a grouse takes wing he makes a similar booming sound. Our author also asserts that the grouse drum only during the day. He (Mr. W.) evidently keeps his hours. I have heard a grouse drum in the night, to wit: at 4 P. M. one night in September. A. MURDOCK, Mansville, Ohio.

While Mr. Murdock is correct in the main in his criticism, he does not indorse the statement that the drumming of the grouse is not a love call; for if not wholly so, it certainly is in part, being intimately connected with the sexual instinct and function. The drumming heard late in the season is almost if not always produced by a "bachelor bird"—one who has not paired during the season; or it may be that the performer is a young bird. We once killed a female grouse in the act of drumming.—Ep.]

Two Questions.—Does the female squirrel ever leave the nest in which she wishes to bring forth her young after she gets pregnant? In such case how does the old lady get drinking water, or does she go without? I have seen several accounts of a singular bird which had been found in great places, and propose to give you a short account of one I picked up by a negro upon my place last fall in the hog woods which were thick. It seemed to be in perfect health, I fancy was overcome by heat, and came down into the fields from which it could not well fly out of. I have often seen in the Brazos River in Texas seen young swan which although fully grown were so overcome by fat and heat as to be in vast numbers in the cotton, unable until after a rest to move. They then, until I saw fit to stop the havoc, were devoured by the negroes with sticks, and you may believe me when I say, we had fine eating. Pardon me, let me return to my bird. Size, about that of the crow; color, that which is commonly known as "ashes of roses"; eyes, red, like those of the pigeon; bill like that of a young quail (nearly grown); short, very short; legs, dark green and six inches long, pretty; feet with four toes, upon each side of the toes what I call ruffles. It was a cross bird and fought savagely. I placed in the box where I kept it a day or two a shallow salad bowl of water, and at night he sought the bowl and roosted in it. Now tell me what it was.

BUD SHOT.

Squirrels produce their young in the spring, and the female during pregnancy is hibernating. Your bird was a coot, (*Fulca americana*), a well-known bird belonging to the family *Rallidae*.—Ep.]

Mr. P. T. Barnum recently published a card in a St. Louis journal offering \$10,000 for a baby, or a full grown elephant born in America. He claims that elephants do not die while in captivity, and that all announcements regarding the American elephants result from a vivid disposition to mislead the public.

## Woodland, Farm and Garden.

BULBOS PLANTS.—We have again been favored by Mr. P. Hanson, of South Brooklyn, one of our most enthusiastic planters, with flowers of the following bulbous plants: *Gladiolus undulatus*, a very rare species. The flowers are bright red, being marked and spotted with white. This singular plant bears its flowers on one side of the stem only, and is a valuable sort to hybridize with. *Gladiolus purpureo-auratus*, a very curious species, with yellow flowers marked with purple; more of a botanical species, however. *Gladiolus speciosus* (Syn. *lanceifolius*), *rubrum*, *roseum*, *punctatus*, and album, with a number of seedlings from them, sent by him, the fruit of many years careful hybridization, many of them much larger in the flower, broader in the petals brighter in color than the types. We understand Mr. Hanson intends to classify these and lay them before the Horticultural Society next season. He also sent flowers of *Gladiolus viticellus*, a beautiful lemon colored variety, and *Gladiolus orange* scarlet with black spots; the curious *Gladiolus californicus*, an Iris-looking plant, and a splendid spike *Amorpha radiata*, a perfectly hardy sort from Japan with pink colored flowers, tipped with purple. This variety is the more singular, as its lower petals spread, allowing the stamens and pistils to come between them as in *A. formosensis*. Mr. Hanson has had this plant in his possession ten years, and it has flowered now for the first time.

NEW CONDITION OF THE VINEGAR PLANT.—At a meeting of the Scientific Committee of the Royal Horticultural Society, London, Mr. Worthington J. Smith, the eminent microscopist, stated that in some recent experiments on the effect of light he had occasion to prepare the following mixture as a restraining agent (in place of pure acetic acid) for the development of negatives: Sulphuric acid, 3 oz.; granulated zinc, 4 oz.; gelatine, 24 oz.; and distilled water, 36 oz., whole being boiled in a closed vessel for three and a half hours. For the purpose of the experiments seventy-five times bulk of distilled water had to be added at the time of use. Smith stated that the original mixture permanently reduced its transparency, but on the additional amount of distilled water being added, the invariable result was that the

mixture quickly became turbid, and more or less filled with minute feathery bodies. These feathery bodies appeared within twenty-four hours and grew rapidly, at length tapering, by long and extremely fine threads, every part of the solution. The fungus bore no sort of fruit while in the dilute mixture, but on being transferred to syrup it floated on the top of the sugary solution and immediately formed a film, which was the true Vinegar Plant. On the film being removed from the syrup and allowed to dry, it formed *Penicillium crustaceum*. Mr. Smith exhibited the plants in question in the solutions, showing the different growth.—*Gardener's Chronicle*, London.

AILANTHUS.—(T. B. Legare, Camden, S. C.)—The smell of the staminate variety of the Ailanthus when in flower, is most sickening, especially on a moist, close evening, and may poison some peculiarly constituted persons, just as the exhalations from the Poison Ivy (*Rhus toxicodendron*) will poison some persons, while others can handle it with impunity. Personally we have never known of any instance of Ailanthus poisoning, but as the tree looks better when headed in, we would advise doing so every two or three years to keep the staminate variety from flowering. The pistillate variety is most beautiful during summer and fall when in fruit. We would be glad to hear of any well authenticated instance of Ailanthus poisoning.—Ed.

A question as to the native country of the Jerusalem artichoke (*Helianthus tuberosus*) has lately arisen, the accuracy of its previous reference to Brazil and Peru by authors having been doubted by Professor Gray. The subject was referred by him to Professor J. Hammond Trumbull, of Hartford, who brought to bear his well-known philological and historical knowledge in the solution of the inquiry. The result has been an identification with the *H. dromicoides* of the Mississippi Valley, and the conclusion that the *H. tuberosus* is simply one of the varieties of form which the other wild species frequently assume.

Professor Gray is also inclined to think that the common sunflower (*H. annuus*) is a derivative by cultivation from the *H. lenticularis* of Douglas, itself only a larger form of the *H. petiolaris* of Nuttall, a native of the Western plains, to and beyond the Rocky Mountains.

THE WHITE ASH IN NEW ENGLAND.—In a note to the Massachusetts "Ploughman," Prof. Sargent says, "An intelligent correspondent, much interested in the subject of tree planting, writes us from the central portion of the State as follows: 'I am fully convinced that those who plant and care for the ash are sure of their reward. I am informed by experts that the ash is more in demand and commands a higher price than any other wood that is indigenous; that the fibre of the ash grown in the New England States is tougher and has more substance than ash grown elsewhere, and that the demand is constantly increasing.' During the Centennial Exhibition, our woods were closely examined by foreigners, and now foreign orders are rapidly coming in, and every vessel leaving Boston for a foreign port is taking out large quantities of ash and walnut." The attention of New England land owners should certainly be directed to the profits which the careful and general cultivation of this tree will give, and to the fact that at no distant day the money value of white ash will be greatly enhanced, the ever increasing demand for it having already rendered this tree comparatively rare in the Eastern States."

THE ARTILLERY PLANT FOR WINDOW GARDENS.—A lady friend of ours has a large specimen of this curious plant, which she has grown since last fall in her kitchen window, and it has given her more satisfaction than all her other window inmates. It keeps constantly green and growing, and as sunlight increases, its mantle of miniature muskets thickened, till now it represents a model unbragging tree, with boughs so succulent and heavy that a rough shake or breath would seem to shatter them. Associated with Oxalises, Mahernias, Petunias, Nerebergias and others, it made January look like May. A great addition to this window in midwinter was the festooned drapery of the Madeira vine.—*Tios. Melian in Gardener's Monthly*, Phila.

FIELD POISONS.—I have read with pleasure the different remedies for "ivy poisoning" my article of June 28 in your paper has brought out. I have tried most of them, such as sugar of lead, sweet oil, copperas, butter, milk and cream tartar, Pond's extract, strong salt and water, and I don't know how many other different things, but I must say I never had anything act as the "black spotted alder wash." Some six years ago I was told to try salt brine. I went to a butcher and had a bottle filled with it and took it home—that is to say, to the place where I was stopping. I went in the bar-room, had a good stiff nightcap of cider brandy (good, you bet—I am a judge of the article), lit a Reine, and went up-stairs to bed, undressed and applied the brine. If some one had set fire to me, I could not have felt worse. I never suffered so much in my life; my dear man, it was fearful. I had the whole house up-stairs and half the village come down to the hotel to see what was up. I never had such a toast in my life, and never want another like it. If I could have found the man that told me to use it, I would have filled him full of bird shot, mustard seed, at that. After reading "Jacobstall's" article, I am convinced his son was poisoned by sumach, or worse than sumach, wildparsnip. I have seen cases of parsnip poisoning just like his son's case. Some people cannot walk through a field where they are burning sumach without the smoke blinding them. Thin-skinned people always suffer the most from these field poisons, and I think light complexions or blondes are more liable to it than dark ones. I see that Fred Graham has tried my remedy and found it a great relief, and doubtless before the summer is over you will hear of others who will find it charming. J. B. A.

—Allow me to call your attention to one more of the good things for vegetable poisons: Tincture of lobelia, one ounce, and fluid extract of belladonna, two ounces; mix and apply to parts affected. I have seen it used very many times, and often with good results. C. A. B. Waterbury, Conn.

A GAME PIE.—The greatest pie on record was made at Lowther Castle, Westmoreland, in 1762, as a present to King George, and weighed three hundred and eighty pounds. It contained two turkeys, four wild fowl, two geese, four ducks, one wild goose, six wild ducks, three teal, two starlings, twelve partridges, fifteen woodcock, two guinea fowls, three snipe, sixteen plover, three water hens, six widgeon, one curlew, forty-six yellow-hammers, fifteen sparrows, two chaffinches, two larks, three thrushes, one fieldfare, six pigeons, four blackbirds, twenty robins, one leg of veal, half a ham, three bushels of flour, and thirty-six pounds of butter. History does not say whether or not this pie was contemporaneous with the one made famous in Madam Anser's work: "When the pie was opened, the birds began to sing," etc.

A LAND OF WONDERS.—Roraima is a great table mountain on the borders of British Guiana, whose steep and inaccessible sides rise from the height of 5,000 feet above the level of the sea 30,000 feet up into the sapphire tropical sky. This wonderful place is, in other respects, a marvel of the world. The highest waterfall known tumbles from its summit at one leap of 2,000 feet, and then rushes impetuously 3,000 feet more on a slope of forty-five degrees down to the bottom of the valley, broad enough to be seen thirty miles away. Only two explorers have yet even reached the base of the table, which, it is estimated, is from eight to twelve miles long.

A VALUABLE HINT.—We read in a scientific journal: "There is a method which I have adopted in my own house to cool the temperature of any room during hot weather, and that is to hang a sheet or blanket down outside windows upon which the sun may be shining. This sheet is wet, and the evaporation of the water produces a deliciously cool apartment. The sheet is kept damp by having a vessel filled with water above the top of it outside, and a piece of flannel arranged to form a siphon, and touching several portions of the sheet. The water gradually empties out of the vessel, and may be replenished if necessary. The window is, of course, open."

It is strange that so simple and inexpensive a method has not found favor here, more especially in sick rooms; a cylindrical-shaped tin vessel, with very fine holes, fixed over the window, would easily supply the water.

BEGONIA WELTONIENSIS.—I wish to add my evidence to yours as to the beauty and usefulness of *Begonia Weltoniensis* for planting out in summer. I first saw it so treated some years ago in the "Bennett" plot in Greenwood and have used it very freely since. If the soil is made tolerably rich with plenty of leaf mould or well decayed and sweetened muck, it will grow and bloom magnificently until frost. The contrast between the soft pink flowers and elegant light green foliage is most pleasing, and the more exposed it is the brighter the colors become. I consider it a most useful addition to our summer bedding plants. P. J.

—Indian famines are usually in consequence of a failure of the water supply. Artificial irrigation was in former times extensively used under the native princes, but most of the old reservoirs and canals are now in ruins—a fatal neglect which sooner or later must be repaired.

—There is on free exhibition at the store of Peter Henderson & Co., No. 35 Cortlandt street, this city, a collection of gladioli, consisting of 1,500 specimens and embracing at least 500 varieties.

—Col. King's wheat crop at Lyndale, Minn., has been threshed and gives a yield of thirty-three and a third bushels per acre of plump No. 1 wheat.

—W. P.—Yes. Now is a good time to plant strawberries, though you must not expect much of a crop next season. Had you layered them in pots, as described by Peter Henderson in "Gardening for Pleasure" the young runners would now have been fit to transplant without receiving the slightest check, would have made good crowns this fall and given a full crop next season. About two feet between the rows and eighteen inches between the plants is about a proper distance apart, as if your ground is well manured and thoroughly prepared to a depth of at least nine inches, you have a much better chance of having fine fruit than if planted closer. Do not neglect to cover your beds with a coating of from two to three inches of straw or leaves on the approach of severe weather, drawing it back from off the crowns as the growth starts in the spring. It keeps the roots warm, the fruit clean, prevents the growth of weeds, and acts as a mulch in dry weather. Sorts vary much in different soils, but you will find *Triumph de Gand*, *Charles Downing*, *Seth Boyden*, *Champion* and *Wilson* all good bearers and varieties that will do well in almost any location. The new variety, *President Lincoln*, you speak of, was shown in magnificent order at the June meeting of the Horticultural Society. It is very large, of good flavor and bids fair to take a high place among the many varieties now grown.—Ed.

P. J.—*Echiochorda grandiflora* next week.

STEWART'S TACKLE.—This is a device little known. Many of the oldest dealers in angling supplies have no knowledge of it. It consists simply of three or four hooks arranged on a single snell, one above the other, on alternate sides; and so far as we can judge, is an excellent device for "threading" a worm. Chomondley Pennell's device is a modification, consisting of but two hooks. The description of the first is found in "Francis Francis' Fishyng," and the latter in Pennell's "Worm Fishing for Salmon, Trout and Grayling." Many are misled, as we were by the spelling of the name as Stuart, when it should be Stewart.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### CANINE THERAPEUTICS AND PATHOLOGY—Sixth Paper.

#### ANATOMY OF THE DOG COMPARED WITH MAN—THIRD SECTION.

The *Thymus* of the dog is, proportionately, much larger than in man, whereas the *glandula thyroidea* is much less, and is divided into two distinct parts, or there are two separate glands. The reason of this difference is unknown, as is likewise the use of the gland. It is generally noticed that these two glands do thus always supply the place of the other; that is, in such animals as have a large thymus, the *glandula thyroidea* is smaller, and *vice versa*; hence we are naturally led to ascribe the same use to both, viz.: The separation of thin lymph for diluting the chyle in the thoracic duct before it is poured into the blood. Then, if we consider the difference of formation of the thorax in both dog and man, we easily account for the variety in bulk of these two glands. Respiration in the latter being chiefly performed by the widening of the chest, the lungs at every inspiration must press upon the thymus, and consequently diminish it; but the diaphragm yielding more to the dog's inspiration, this gland is not so much compressed, and hence will be larger, and consequently the thyroidea will be proportionately less. Again, from the posture of the animal, we see that it is much more convenient to have most of the lymph supplied by the thymus, since the neck being frequently in a descending posture, the secretion of the thyroid gland would have a very disadvantageous course to reach the thoracic duct; whereas in man the thymus is really below the lacteal canal when it makes its curvature before opening into the sub-clavian; consequently it is necessary that the larger share of the diluting fluid be furnished by the thyroid, which is situated much higher, so that the lymph has the advantage of a perpendicular descent. The thoracic duct of the dog has no curvature before entering the sub-clavian vein, the horizontal position of the animal allowing a sufficiently favorable course to the chyle, so as not to demand that turn to force its passage into the blood. It may likewise be observed, that such animals as walk horizontally have the valves of this duct fewer in number than others. The horse has but a single pair, while, on the contrary, the *simiæ* resemble the genus *homo* in having several. Thus the lymph is not only forwarded in its passage, but the weight of the column is diminished.

The lungs are divided into more lobes, and deeper, for the same reason as the liver. The left side of the thorax bears a greater proportion to the right than in man, the one being nearly as three to two, and the other as four to three. In quadrupeds as well as in *bi-mana*, the lungs are closely applied to the containing parts, although this has been denied by some.

It is a general rule that all quadrupeds which gather their food from the ground are provided with longer necks than man; but as a long neck not only gives the advantage of too long a lever to the weight of the head, but also, when the animal is gathering his food, places the brain in danger of oppression from the too free determination of blood, which in its return through the veins, has the disadvantage of remounting contrary to its own gravity, it was therefore necessary that a part of the length of the neck should be supplied by an increase in length of jaws. Thus we see horses and cattle, though having no occasion to open their mouths very wide, are yet provided with very long jaws. Bull-dogs, indeed, and such animals as have occasion for very strong jaws, must of necessity have them short; for the longer they are, the greater the resistance to be overcome. Another exception to the general rule is such animals as are furnished with paws or hands to carry the food to the mouth, as cats, monkeys, etc.

The teeth show the dog to be of the carnivora, as none are adapted to the grinding of food, but only for tearing and dividing it. He has six remarkably sharp incisors, and two long canines posterior, all of which ruminating animals want. These are evidently calculated for laying very firm hold of substances for the purpose of rending them, and the vast strength of the muscles inserted into the lower jaw assists materially in this action, while the pre-molars have sharp edges, calculated for cutting flesh and reducing the hardest bones. Even the molars are not formed with rough, broad surfaces as in man, but are considerably sharper, and press over one another when the mouth is closed, that they may take the firmer hold of what comes between them.

The tongue, in consequence of the length of the jaws, is elongate; and as feeding is accomplished with the head in a depending posture, the bolus would always be in danger of falling from the mouth were it not for several prominences or papillæ with which the organ is studded, most numerous at

its base. These are curved backward in such a manner as to allow anything to pass easily down to the jaws, but prevent its return. By these papillæ, also, the surface of the tongue is increased, and a stronger impression made on the sensation of taste. In some animals, who feed on living forms, these "tenter-hooks" are still more conspicuous, as in several large fishes, where they are almost as large as the teeth in the fore-part of the mouth, and nearly as firm and strong.

When we open the mouth we see the amygdalæ very prominent in the posterior part of it, so that it would appear at first view that they were inconveniently placed; as being continually exposed to injuries from the hard substances the animal continually swallows. But upon closer scrutiny we find this provided for by two membranous capsules, into which the amygdalæ, when pressed, can escape, removing themselves from such injuries. The *velum pendulum* is considerably longer than in man, to prevent the food passing into the nose, which would happen most frequently in the dog because of its situation while feeding. There is no *uvula*, but the *epiglottis*, when pressed down, entirely covers the whole rima, and naturally continues so. There is, therefore, a ligament, or rather muscle, given off from *os hyoides* the end and root of the tongue, that is inserted into that part of the epiglottis where it is articulated with the cricoid cartilage, which serves to raise it from the rima, though not so strongly but that it may with slight force be again replaced. It may be asked, Why is the uvula wanting here and not in man? It seems that quadrupeds who swallow their food in a horizontal position have no occasion for such, though essential to man in his erect posture.

In the upper part of the pharynx, behind the cricoid cartilage, a gland of considerable size is found, which serves not only for the separation of a mucous fluid to lubricate the bolus as it passes this way, but also supplies the place of a valve, preventing the food regurgitating into the mouth, which it would be apt to do by reason of the depending situation of the head. The oesophagus is pretty much the same in both dog and man. It is alleged by some that the gullet of a quadruped is composed of a double row of circular fibres discussing one another. This is, however, peculiar to ruminants alone, who have need of such formation. The action of these may be easily observed in a cow chewing her cud.

The nose is longer, and its external passage much narrower than in the biped, and the internal structure is much better adapted for an acute sense of smell, having a larger convoluted surface on which the *membrana scheideriana* is spread; this is observed in most quadrupeds who have the *ossa spongiosa* large and divided into a great number of thin lamellæ. The sensibility seems to be increased in proportion to the surface. The elephant, which has a head large in proportion to the body, has the greatest part of it taken up by the cavity of the nose and frontal sinuses, the latter of which extend over the whole head, leaving but a small cavity for the brain. A very fine sense of smell is not so absolutely necessary for man, who has judgment and experience to direct him in the choice of his food, whereas the other animals, who have only their senses, must of necessity have them acute, some having one in greater perfection than others, according to their different way of life. We not only conclude *a priori* from the large expanded *membrana scheideriana*, that their sense of smell is very acute, but we believe that horses and cattle principally distinguish between noxious and wholesome herbs through it.

The external ear in each genera of quadrupeds is differently formed, but always calculated to meet the wants of the animal as demanded by its manner of life. In shape it usually resembles the oblique section of a cone, from near the apex to the base. Hares and such other animals as are daily exposed to danger from beasts of prey, have large ears directed backward; rapacious animals, on the other hand, have these organs placed directly forward, as in the lion, cat, etc. The sleuth-hound and other animals that are designed to hear most distinctly the sounds coming from below, have these appendages hanging downward; or their ears are flexible, for the reason the head is less flexible than in man, and is not readily moved so as to catch the wave sounds. Man, again, who must equally hear sounds coming from all quarters, especially such as are sent from about his own height, has his external ear placed vertically, though slightly turned forward. In short, wherever we see any peculiarity in this organ that has not arisen as deformity, we shall, with very little reflection, discover this form to be better adapted to the animal than any other. The dog also has the power of directing the cone of the ear to the sonorous body without moving the head. There are some differences to be observed in the structure of the internal ear; but there is so little known of the use of the particular parts in the human subject, that it is hardly possible to assign cogent reasons for variations in other beings. All quadrupeds have at the internal canthus of the eye a strong firm membrane with a cartilaginous edge, which may be made to cover some parts of their eye. This is greater or less in different species, as their eyes are more or less exposed to dangers in searching after food. This *membrana nictans*, as it is called, is not very large in the dog; cows and horses have it so large as to cover one-half of the eye like a curtain, at the same time so transparent as to allow the rays of light to pass through in abundance. Fishes have a cuticle always over their eyes, as they are ever in danger in the "inconstant element."

The nictating membrane, or third eyelid, with its accessory muscles and other structures, is especially well developed in birds, and is of

All quadrupeds have a seventh muscle belonging known as the *suspensorius*. It surrounds almost the optic nerve, and is fixed in the sclerotic coat as the are. Its use is to sustain the weight of the globe of the eye, and prevent the optic nerve from being too much stretched without compelling the four straight muscles to be in constant contraction; at the same time this muscle may be so assist any of the other four, by causing one particular of it to act at a time.

The pupil also, which varies with different animals, is accommodated to the habits of its owner, as well different species of objects that are viewed. Man has a large pupil, for reasons obvious: An ox has it oval with the diameter transversely that he may take a larger view of food; cats, again, have theirs likewise oval, but the diameter is perpendicular, that they may either catch bright light altogether, or admit only so much as is needed. The width of the pupil also varies in different animals, as the internal organs of vision are more or less thus cats and owls, who seek their prey in the night or places—and consequently must have their eyes so furnished that a few rays of light may make a lively impression on the retina—have their pupils in the day-time contracted into narrow space, as a great number of rays would oppress the delicate organs; while in the night, or when the light is faint, the iris is enlarged and the rays fully admitted. In the same way when the retina is inflamed, numerous rays of light would occasion painful sensations; therefore the pupil is contracted. On the contrary, with the dying or the beginning of an attack it is generally dilated, as the eyes become insensible, the posterior of the choroid coat known as the *tapetum*, is of different hues in different species. Cattle feeding mostly on grass have this membrane of a green color, that it may upon the retina all the rays of light which come from it of that color while other rays are absorbed; thus the animal sees its food better than it does other objects. Cats have their tapetum of a whitish color, and for the same reason have the iris very dilatable and their organs of vision more acute, and we find that all animals see more or less distinctly dark, according as this membrane approaches nearer to a dark or white color. Dogs who have it of a grayish color distinguish objects better in the night than man, whose tapetum is dark brown; and who, it is believed, sees worst in the night of any being, as designed to rest from all labor in the night. The difference then of the color of the tapetum, as in the fabric of any other in different animals, always depends upon some particular advantage accruing to its peculiar manner of life from this singularity.

As in man, the brain is divided into cerebrum and cerebellum, and these two parts bear nearly the same proportions to one another. It is proportionately smaller, which would be necessary, as a bulky brain would be inconvenient, and considerably to the weight of the head, which, having a lever to act with, would require a much greater expansive force to support it than is now the case; for the heads of the greatest part of quadrupeds are not near so heavy as the head of man, and the *sinus frontales* being prolonged, considerable distance to enlarge the olfactory organs.

The pits in the anterior part of skull are much more spacious than in the human, which may be occasioned by the depending posture of the head while feeding, the brain, through gravitation, pressing upon the bones, they are yet soft. The *fulcrum cerebri* is not nearly so high in quadrupeds as in man, as they have little occasion to lean either side, and the two hemispheres of the brain are either measure hindered from jostling one another in motions, by the brain insinuating itself into the above mentioned pits.

The second process of the *dura mater*, or *tentorium bello super-expansum*, is considerably thicker and stronger in quadrupeds, especially in such as are very swift of foot, as hares and rabbits, and that most when they are old. The membrane is generally ossified, or we find its place supplied by bone, that it may the more effectually keep off the incumbent brain from the cerebellum in their rapid motions. The olfactory nerves are large, justly deserving the name of *processus mammillares*. They are hollow, and contain a medullary and cineritious substance, and at first appear to be the anterior ventricles of the brain produced; but man they are small and without any discernible cavity. The reason of this is evident, if we consider the position of the canine head; for the lymph continually gravitates upon the inferior portion of the ventricles, would seem to prolong and produce them. From this olfactory nerve given off, and are sent directly through the *os ethmoidale* to the nose. From this the ancients, to whom the very rudiments of practical anatomy, studied from the human subject, and whose observations on animals were not very superficially conducted, thinking these nerves hollow to the nose, believed them to be the entrance of the brain, through which, also, the mind escaped, and, asleep, to revel in the scenes of other lands.

The *tubercula quadrigemina* are larger than in man, they are of different colors, the upper pair, or *optici*, the color of the cortical, and the lower, or *teles*, of the duller substance of the brain. The reason of these differences, and other of the like nature to be met with in comparing dog and man, we shall not attempt to determine. Were zoology a science we might look to it for an explanation; unfortunately its principles and deductions are but the vagaries of the diseased organ which it pretends to treat.

BRETON HOUNDS.—The Brittany hound, like the greyhound, is a big, bold, broken-haired animal, with a strain of blood. The dog and wolf, being congeners, breed together, and the law affecting mules does not apply to the greyhound race, as the offspring of the first cross reproduces the traits with the same facility. A dog-wolf is usually bred by hand, and he, suckled in infancy by a hound dam, is perfect concord with any hounds that may be included in company. The first cross is usually far from being a running mute, or all but mute, and so self-willed in the chase, and fierce in the kennel that they are seldom used, but kept to breed from alone. The second cross, however, a grand offspring of the wolf, become rare wolf-hounds, fierce, fine-nosed, desperate in the chase, never tire the longest day.

much functional importance to them, as it can be rapidly changed to the whole eyeball. It is found in some reptiles and amphibians, and some fishes, and in sharks. It is fairly well developed in the divisions of the mammalian series, viz., in the *Monotremata*, *Didymotremata*, and in some few of the higher mammals, as in the whale, man, the quadrumanus, and most other mammals, as established by anatomists, as a mere rudiment called the *nictitating*

FOXES, COCKER SPANIELS,  
ETC., ETC.

[FROM OUR SPECIAL CORRESPONDENT].

FOREST AND STREAM:

Recent letter to the *Chicago Field*, "Pious Jeems" pours the vitals of his wrath upon "Hawkeye" for shooting at and denunciations, with eloquent indignation, all who count the death of foxes by any other means than by fair hunt and running with bounds. Bred and reared like the Laird of Inchmar in the south, where the venatic instincts of our ancestry are still alive, and where to shoot a fox is to be more ungentlemanly and little less criminal than to shoot a man, I was inclined to add my individual Amen! to the vigorous anathemas; but, *tempora mutantur*, and now, somewhat to my own surprise, I find myself not only unwilling, under certain circumstances, to condone vulpicide, but ready to advocate the slaying of foxes as I would that of other vermin destructive of feathered game.

The civil war put a stop to fox hunting in the South, and as the number of course foxes increased in numbers and feathered game diminished in quantity. Three years since, when field editor of the *Turf, Field and Farm* I received a letter from my friend Harrison, of Brandon—than whom there is not a better or more observant sportsman anywhere—deploring the scarcity of partridges (quail), once so abundant on the broad fertile low grounds of the James and all the Southern States and attributing it to the increase of foxes consequent on the suppression of the numerous packs of hounds which the ante-bellum days were to be found in almost every part of the dear Old Dominion.

In all countries save England and our Southern States Reynard is held to be the chief of sinners, and is remorselessly wherever and whenever the opportunity offers, and for excellent reason that being the most sagacious he is also most destructive of all the predatory vermin. In Great Britain fox hunting is more than a national sport—it is a national passion; and, as a consequence, England can boast of the best horses and horsemen in the civilized world. In England the landed proprietor, be he prince or peasant, who would let a fox would be denounced and execrated by name in the public prints, while he who protects the foxes is revered as a public benefactor. On the continent of Europe fox hunting, practiced in England, is almost unknown, and the favorite sport of destroying Reynard is with a shot gun, as he plays the doubles before a pack of slow but persistent bassets or dishunds. The late war proved that there is no accomplishment in which our young men north of Mason and Dixon's line are so deficient as in horsemanship, and as the best school for acquiring the accomplishment is the hunting field, it is greatly to be desired that subscription packs for hunting fox should be established in every state in which the climate and other conditions may permit.

The attempt is now being made in New York by Mr. Belmont Purdy and other young men of true grit, to get up a pack on Long Island, and there is no reason why it should not succeed, for before and after the Revolution a subscription pack, the records of which are still extant (in the New York Historical Society, I believe), afforded great sport. Subscription packs of hounds have been maintained at Montreal and Toronto, in Canada, for several years. There can, therefore, be no climatic reasons urged against their establishment in every State in the Union. If Messrs. Bennett and Glass and other players at Polo would divert their subscriptions from that dangerous game to the maintenance of a fox or fox-hunting establishment, the rising generation will not be as ridiculous as is the present in the eyes of Europeans for their utter ignorance of the equestrian art, and, as in England, horsemanship will become an indispensable accomplishment to our youth of both sexes.

Pardon me, Mr. Editor, when I get upon fox hunting I don't know when to stop, and, like an old hound, I become so mouthy; what I meant to say was that—Old Pious to the contrary notwithstanding—there are cases in which a man may shoot a fox without being put to death without credit of clergy, as he undoubtedly should be if the murder is committed in a hunting country.

I was gratified to read in your issue of the 26th of July a notice of Mr. F. H. Hoe's cocker spaniels, a breed of dogs destined at no distant day to become more highly appreciated than in England, their native country. I have for years been with both speech and pen an earnest advocate of the cocker.

His beauty and companionable qualities no one will deny; but I know from experience in the field that for general shooting in many parts of the country, and those too most bounding in game, the springer or cocker is the most valuable of all dogs, the pointer and setter not excepted. I remember—it was many years ago—shooting in the glades of Maryland, not far from Oakland, over a team of six or seven cockers belonging to Mr. Cunningham, a Scotch gentleman. One day we killed a deer, two turkeys, three woodcock, and a lot of ruffed grouse over these dogs, which while under perfect control were the most lively hunters I ever saw; they were ranged more than thirty yards in advance of the game. There are, as you know, several varieties of the cocker in England, but, unfortunately, all of them very rare in this country, and I would not know where to find them without applying to Sherwood, of Missouri; Bester, of Connecticut; Messrs. Belmont, Purdy and Hoe, of New York.

When I was a boy—I need not state how many years ago—the late Mr. MacTavish, British Consul, had a kennel of mag-

nificent liver-and-white cockers at Doreghan Manor, the present residence of the Governor of Maryland. I should like to know if that strain of cockers has been preserved—the last of the breed which I have seen was the pet of my grandmother, Mrs. Chancellor Bland, his name was Guess? and he was death on cats. F. G. S.

**RUSSIAN SETTERS.**—I have read with much interest the article by "J. S.," "A Grouse Hunt in Sweden," in your issue of 7th inst., and would congratulate you upon the acquisition of so graphic and edifying a contributor. I hope he may be influenced to extend a repetition of his sporting experiences in your behalf, and to the gratification of your numerous readers, of whom I am one. His testimony in favor of the Russian setter is timely, the subject having been lately introduced in your paper; and being new to our sporting community, of marked interest. It seems to me the qualities of this dog render him well adapted for our use in the New England States as best suited to our shooting, followed as it chiefly is in woods and swamps. Our game birds affect these retreats, which are thick with brush and briar, and difficult to penetrate by man or beast.

How many a bird lies under the brush *perdu* and secure from the search of the high-ranging dog, who, though typifying the poetry of grace and motion while hunting in the open (*vol-delicet* on the Western prairies), is not equal to the cunning of the oft-hunted December quail so secreted. I hope J. S.'s readable paper and strong testimony to the good qualities of the Russian setter may be the means of directing the attention of our enterprising sportsmen to their introduction here, and importation of the pure breed from wherever it is to be found. SENEX.

**DOGS AS DRAUGHT POWER.**—One of the most noticeable features of the capital of the German Empire is the use of dogs in aiding local traffic. Bakers' and grocers' wagons, milk carts, fruit and mineral water stalls, furniture cars, and the lighter vehicles of all descriptions may be seen drawn by teams of dogs harnessed like horses, often three abreast. Or, again, the motive power may consist of a dog and woman, or dog and boy, harnessed side by side. Among the licensed conveyances of this imperial city, 2,186 dog carts are registered, and the loads to which these animals are frequently subjected, would cause Mr. Bergh and other humanitarians to dance with rage. Dogs are emphatically draught animals in Holland, but they are cared for, well-fed and groomed, and seldom if ever taxed beyond their strength; but in Berlin the animal is almost always a filthy, sore-eyed, maimed, mangy animal, an exact quadrupedal prototype of his master or mistress, without even the affection of the animal of the cat's-meat man, who did Timothy, Old Mixon so beautifully. Had Tim invested in a Berlin dog he would not have been forced to suspend business for lack of effects.

**DOG LAW.**—The following is a digest of the laws passed by the Legislature of Maine last winter relative to canines. "Every owner or keeper of a dog shall annually cause it to be registered, described, and licensed for one year, in the office of the city or town clerk wherein he resides, by paying therefor, to said clerk, the sum of twenty cents; and shall cause it to wear around its neck a collar distinctly marked with the owner's name and registered number, and shall pay into the treasury of the city or town for such license one dollar for a male and two dollars for a female dog.

"Whoever keeps a dog contrary to the provisions of this act shall forfeit ten dollars, to be recovered on complaint, to the use of the city or town wherein the dog is kept, and any person may, and every police officer and constable shall, kill or cause to be destroyed, all dogs going at large, and not licensed and collared according to the provisions of this act; and such officers, when not otherwise paid for their services, shall receive from the city or town treasury fifty cents for each dog so destroyed.

"Whoever wrongfully removes the collar from, or steals a dog licensed and collared as aforesaid, shall be punished by a fine not exceeding twenty dollars; and whoever wrongfully kills, maims, entices, or carries away such a dog, shall be liable to the owner for its value."

**CANINE INSANITY.**—Louisville, Kentucky, had a Newfoundland who was supposed to be insane through grief—a fact not at all improbable. Mr. Clare Boustead, the owner of the animal, moved to Philadelphia, leaving the poor dog behind, homeless and friendless. As soon as the animal realized his situation, he began the most piteous lamentations, and would lie for hours at the door of the deserted house, crying and groaning with genuine grief. Sometimes he would paw and bark at the door, and then rush frantically around the house. After the first week of his abandonment, he became very stupid, and would lie about wherever he could find a place of rest, apparently unconscious, meantime refusing the kind words and food which he was offered by the neighbors, or accepting of the latter but sufficient to prolong life. All this time he showed no ill-nature, but seemed so totally overcome with grief as to be insensible to either kindness or cruelty. Finally it was believed by all that saw him that he had become insane, and a policeman was persuaded to remove and kill him.

**A BOY'S LETTER.**—The following characteristic letter will perhaps recall to more than one of our readers those summer days long ago when they romped and frolicked with their first dog friend. It is only necessary to explain that the "he" is a noble Newfoundland, who occupies a very large place in the heart of the writer:

DEAR PAPA: It is Wednesday, and he is so affectionate. I throw sticks into the brook and he brings them. I didn't mean to make that blot. Your little boy, ALLE.

**DISTEMPER.**—About ten years ago I had a setter puppy about eight months old, which I sent into the country to a breaker. This man was the village blacksmith, a practiced farrier, and I supposed he had some knowledge of canine pathology in an old-fashioned way. Immediately on his receiving the puppy, he extracted two teeth, remarking as he did so, "I just got him in time; if I hadn't pulled them out, he'd have got the distemper."

The puppy remained in his possession for about six months thereafter, when he was stolen. Whether he ever got the disease of course I have no means of knowing.

I thought no more of the above until I chanced to read the following remarks of Mayhew: "During the latter period of dentition—that is, when the second set of incisors are well up, and the permanent tusks are about half grown, the temporary ones being still retained—is the time when pups are most disposed to display this disorder. I cannot state the precise age, because mouths are not regular in their appearances, even as to mouths, but the aspect of the teeth will sufficiently mark the period when an individual may be expected to be attacked."

Perhaps the above may throw some light as to the cause of the disease, viz.: the teeth. E. L.

Such an idea is perfectly nonsensical, and is as sensible as the theory that throwing a knotted string over one's left shoulder will remove warts, or cutting one's toe-nails with a file will prevent measles. The statement in Mayhew is about as near right in this as in most of his statements; his work being an unreliable one in every particular.—Ed.

**FINE PUPPIES.**—A rare opportunity is now offered those of our readers who desire to purchase finely bred dogs. In another column will be found an advertisement of pointer puppies for sale, sired by the celebrated Snapshot; and setters by the great red Irish dogs, Jarvis, Elcho and Mr. Macdonald's Rover. The breeder of these dogs is Mr. Wm. M. Tilston.

**"DUKE OF ORANGE."**—We are called upon to chronicle the death on Aug. 3 of this magnificent setter, owned by T. A. Fowler, of Orange, N. J. If there is a "heaven for good dogs," Duke will have a seat, with none above him.

**DOG DAYS.**—This is what the weather is doing for the editors:

Dogs must have been valuable property in the days of the "Golden Fleas."—*Rockland Courier*. Even the dogs complain of the hard times. It is the tin panic that affects them.—*Turner's Falls Reporter*. Highly intellectual dog: Type-setter.—*Ec.*

—Mr. Von Culin, of Delaware City, Del., publishes a neat little manual of instructions for breaking dogs, with the mode of using the force collar. Price 25 cents. May be had of the author.

—The Municipal authorities of New York City have received for dog licenses \$33,858.

—Fisher and Bickerton inform us that their red Irish setter Belle has eleven blood red puppies, not a white hair on them.

—The first International Bench Show will be held at London, Ont., Sept. 26, 27, and 28. Entries to close Sept. 10.

**NAME CLAIMED.**—I claim the name of Lady Sensation for my pointer whelp out of Lady Francis, by Sensation, West Troy, N. Y., Aug. 17. JOHN H. FITCHET.

—I claim the name of Bessie for my liver-and-white ticked pointer bitch, out of Dilly's Queen by Dilly's Champion Ranger. T. C. BANKS.

**ABOUT BORAX.**—BORAX was known to the ancients, but its chemical discovery was first ascertained by Geoffrey in 1732. Since then it has gradually increased in use and importance as a remedial agent, and for various other purposes, until it has come to be reckoned an indispensable article in hygienic and domestic economy. Of late years it is increasingly used for toilet purposes, and in the laundry and household—so generally, indeed, that every well regulated family regards borax as one of the necessities. The article has been greatly cheapened, and its preparation perfected, by the discovery of Messrs. Smith Brothers, of Nevada and New York, of an inexhaustible bed of crude borax, and their improved process of manufacturing and refining it for use in the purest state. This superior article is furnished at a low figure by grocers and druggists throughout the country. A most useful and convenient article is thus placed within the reach and means of the whole people, as it can be readily obtained without being subjected, as heretofore, to paying the price of a luxury therefor.—[See Adv.]

## SPLIT BAMBOO RODS.

To Our Customers and the Public: In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
—[Adv.] Manufacturers, 65 Fulton Street, N. Y.

**A POUGHKEEPSIE ROOSTER.**—An unfortunate game cock, by a sad and unforeseen accident, lost his left leg. His owner, a boy of inventive genius and surgical talent, whittled out a wooden leg and attached it to the amputated member; yet the ignorant bird spent the balance of the day and part of the night in attempting to rid himself of the improvement. At last overcome by fatigue, he placed his head under his wing and retired to rest; but in the morning he had forgotten all his troubles, and trotted off with the greatest ease, much to his own satisfaction and the unbounded delight of the small boy.

## THE DETROIT REGATTA.

[FROM OUR OWN CORRESPONDENT.]

DETROIT, Mich., Aug. 17, 1877.

## EDITOR OF FOREST AND STREAM:

The series of regattas which commenced in this city on Tuesday, was inaugurated by the races under the auspices of the Detroit River Navy, which was the opening of what proved to be the most brilliant aquatic event that has ever transpired in America. The preliminary arrangements for the regatta, the preparations for the entertainment of the participants and the enormous crowd of spectators which flocked to witness the sport were admirable, and reflected the highest credit upon all the hospitable gentlemen connected with the committees. The weather however behaved badly, and caused many a pang of disappointment to hundreds of eager expectants. To sit for an hour or two on the soft side of a plank in suspense during incomprehensible delays—trying to "possess your soul in patience"—is fully bad enough;

"But when the day his rainy mantle keeps,  
And wraps about him till with eve he sleeps,"

it is simply horrible. The grand stand, which had been erected to accommodate about 4,000 people, was constructed for fair weather, not such a deluge as that which poured down upon the devoted heads of the occupants on Tuesday and Wednesday. However, they were courageous enough to brave the elements throughout, and were well repaid.

The races for the first day were announced as follows:

Swimming match, 200 yards down stream. This was won by F. W. Campbell in 2:17.

This was followed by a tub race of the usual amusing nature; won by Campbell.

At five o'clock the junior double-scutt race, one mile up stream and return, was called. There were four entries, Gog-uacs, of Battle Creek; Sho-wae-cae-mettes, of Monroe; Wolvenhooks, of Greenbush, N. Y.; Floral City, of Monroe, having positions in the order named. The Floral City withdrew, leaving the first three to contest the race. The Sho-wae-cae-mettes led the first quarter, pulling a stroke of thirty-eight to the minute, with the Wolvenhooks second and the Gog-uacs third. At the half mile the Wolvenhooks took the lead and kept it the remainder of the way home, pulling an easy stroke of thirty-two to the minute; Sho-wae-cae-mettes second and Gog-uacs a long distance in the rear. The turn was made in eight minutes and forty seconds by the Wolvenhooks; Sho-wae-cae-mettes in nine minutes. Time of race: Wolvenhooks, 15:44; Sho-wae-cae-mettes, 16:13.

The following are the crews: Wolvenhooks—stroke, F. W. Tompkins; bow, W. T. Miles.

Sho-wae-cae-mettes—stroke, Joseph Nadeau; bow, Moses Nadeau.

Gog-uacs—stroke, P. W. Brown; bow, Ellis Smith.

The next race called was for junior pair-oared, one mile up stream and return, which was won by the Detroit scullers in 14:55; Emeralds, of Saginaw, second in 15:12. The following are the crews:

Detroit Scullers—stroke, J. H. Clegg; bow, W. C. J. Campeau.

Emeralds—stroke, P. McElgunn; bow, P. J. Manning.

By far the prettiest race of the day was the ten-oared barge race, which closed the day's sport. In this race there were eight entries, the Wah-wah-tah-sees, of Ecorse; Chattanooga, of Detroit; Grand Rivers, of Lansing; Teutonias, of Detroit; Detroit, of Detroit; Centennials, of Detroit; Wyandottes, of Wyandotte, and Restless, of Detroit, all of which rowed over the course. The start was a grand spectacle, and cheer after cheer rent the air as the eight barges passed the grand stand side by side, and continued nearly so for almost a quarter of a mile. This race was three-fourths mile up stream and return, and was won by the Wyandottes in 8:56, with Chattanooga second in 9:05 and Centennials third in 9:12.

On account of the lateness of the hour the junior single was postponed until the next day.

The regatta proper was opened on Wednesday with the four-oared shell race, mile and a half.

First Heat—Entries—Detroit Club, Detroit; Eureka Club, Newark; Emerald Club, Saginaw Bay; Sho-wae-cae-mette Club, Monroe; Excelsior Club, Detroit.

The struggle between the Emeralds and Eureka was close, the former winning in 7m. 58s., eighteen seconds faster than was ever before made in the association. The Eureka followed in 7m. 58s.

Second Heat—Entries—Union Spring Club, New York; Zephyr Club, Detroit; Watkins Club, Watkins Glen; Wolvenhooks Club, Greenbush, N. Y.

The Union Springs stopped rowing at the half mile and claimed a foul, which was not allowed, against the Zephyr. Won by the Watkins in 7m. 46s.; Zephyr second in 7m. 50s.

The next race was a mile and a half, for double sculls. Entries—Quaker City, Philadelphia; Mutual, Albany; Ultras, Troy, N. Y.; Pilot, Grand Haven.

From the start the race was virtually between the Quaker City and Mutual crews. Won by the former in the splendid time of 8m. 18s.

Following came the last race of the day, the final heat for four oars. This, after a close contest, resulted in a victory for the Emeralds in 7m. 50s.; Eureka, 7m. 50s.; Zephyrs, 7m. 55s.; Watkins and Union Springs not timed.

The first event on Thursday was the junior single scull race of one mile and turn. Won by Sandway, of the River-side, Rochester, N. Y., in 15m. 47s.

The second race for pair-oared shells, one mile and a half straightaway, was won by the Emeralds, of Saginaw, in 9m. 4s. The Detroit scullers second in 9m. 7s.

The third race was for single sculls, one mile and a half straightway. The Yales and Vespers, of Yonkers, having withdrawn, there were only four entries: Lee, of the Tritons; Yates, Grand Haven; Tompkins, Wolvenhook; O'Donnell, New Orleans; Yates withdrew soon after start. The result was a victory for Lee in 9m. 11s.; O'Donnell, 9m. 14s.; Tompkins, 9m. 20s.

In the four-oared race, three miles with turn, there were seven entries. The Zephyrs broke an oar and retired. The Eureka, who were leading by three lengths, found that their turning buoy had been removed, rowed a distance to the next buoy, and so fell behind ten lengths, which gap before the finish was reduced to one length. The finish was: Sho-wae-cae-mettes, of Monroe, 18m. 50s.; Emeralds, of Saginaw, 18m. 54s.; Wolvenhooks, 18m. 57s.; Eureka, of Newark, 19m. 3s.

The junior six-oared race between the Excelsiors and Zephyrs, of Detroit, and the Undines, of Toledo, was won by the Zephyrs in 18m. 34s.; Undines, 18m. 40s.

At a meeting of the National Association, held at the Detroit Boat Club house in the evening, the following gentlemen were elected members of the Executive Committee: George W. Parker, Quaker City Boat Club, Philadelphia; T. W. Kennedy, Passaic Boat Club, Newark; H. W. Garfield, Mutual Club, Albany.

The regatta of the Northwestern Association was opened on Friday with the junior double sculls. This was won by the Floral City crew, of Monroe, Mich., in 16m. 31s.; their competitors, the Sho-wae-cae-mettes, of the same city, following in 16m. 32s.

The senior single scull race was thrown open to all, and the following were the entries: P. E. Yates, Grand Haven; W. F. Sandway, Rochester; James O'Donnell, New Orleans. Yates won in 14m. 37s., followed by Sandway in 15m. 10s. O'Donnell came in a length ahead of the latter, but, having turned his stake from starboard to port, lost the award.

The race for senior four-oared shells, three miles with a turn, was rowed by the Emeralds, and the Sho-wae-cae-mettes. Won by the latter by three open lengths in 18m. 37s., or 34s. better than their time of Thursday. The Emeralds crossed the line in 18m. 47s.

The junior six-oared shell race was won by the old champions, the Zephyrs, in 18m. 34s.; the Undines following in 18m. 40s., and the Excelsiors in 19m. 6s.

This was the concluding event of the day.

The first event of the closing day was a swimming match between W. F. Sandway, of Rochester, N. Y., and H. Newberry, which was won by Sandway by 10 feet.

The junior single scull race, one mile and return, was won by M. Nadeau, of Monroe, in 17m. 58s.; his two opponents meeting with mishaps.

The double scull race, open to all, same distance, was entered by W. S. Mosely and C. Piepenbrink, of the Albany Mutuals, and Miles and Craig, of the Wolvenhooks. Won by the latter in 14m. 23s.

The six-oared race, for the Northwestern amateur championship, was the event of the day. The entries were: Excelsiors and Zephyrs, of Detroit. Won by Excelsiors; time not announced.

The closing event was the junior four-oared race, same distance. Entries—The Amateurs and Floral City, of Monroe; Zephyrs and Excelsiors, of Detroit, and Undines, of Toledo. The Floral City won in 19m. 48s.; Zephyrs second; Undines third, and Amateurs fourth. The Excelsiors broke down their boat, and were towed in.

MAINE—Portland, Aug. 17.—Race for second class yachts; challenge cup; distance 18 miles. Won by the Georgie in 2h. 51m. 25s. sailing time, and 2h. 7m. 7s. standard time.

RHODE ISLAND—Newport, Aug. 15.—Six yachts of the Newport Yacht Club entered for the Loricard prize. Won by the Victoria, owned by J. R. Roosevelt, of New York.

Newport, R. I., Aug. 18.—The yacht race of 16 miles was won by the Fidget in 2h. 31m; Victoria second in 2h. 31m. 40s.; Annie M. third in 2h. 32m. 20s.

MASSACHUSETTS—Beverly Yacht Club.—The second regatta this season took place off Nahant. The course was from Nahant Point, leaving Red Buoy No. 2, off Winthrop Head on port hand, to the judges' yacht, a distance of seven miles.

The first prizes and the champion pennant were taken by the Water Lily and the Virginia, and the second prizes by the Ida and Frolic. Summary:

| Boats.          | Owners.            | Length. | Cor. Time. |

New York—New Rochelle, Aug. 18.—The fourth annual regatta of the New Rochelle Yacht Club was an event of much interest in aquatic circles. The course was from a stakeboat anchored off David's Island to and around a buoy anchored off Throgg's Neck, five miles from the starting

point, thence to and around stakeboat anchor, returning to starting point. The first, second, third, and fourth prizes were required to go over this course twice; the first prize once. Following is a summary:

First Class—Entries—W. F. Davids, Polly, Dare 1st. Greenpoint, Susie S. The Susie S. won in 1h. 13m. 18s.; Dare Devil coming in second; time, 5h. 20m. 49s.

Second Class—Entries—C. F. Ammon, Coquette, Marj Thistle, Pluck and Luck. The Pluck and Luck won in 23m. 23s.

Third Class—Entries—Frou Frou, G. Kapp, George Sanders, Willis, Emma, Ripple, Inspector, Josie, Annie, Soph Truant, Margotta, Joke. Won by the Frou Frou.

Fourth Class—Entries—Ella, Anita, M. E. Baker, Louisa, Anna, Gracie, Gertrude, High-pl, Jessie, Jerome, Mary Anne, Fidget, Corn D., Fanny M.

Fifth Class—Entries—Bed Bug, Little Pluck, Mary Lulu, Susie, Centennial, Flora. Won by the Mary B.

Whitestone, Long Island, N. Y., Aug. 16.—Sw stakes race; cat-rigged boats; distance, about 20 miles. Won by the Ellie outtime allowance. Summary:

| Boat.             | Owner.                   | Start. | Time. | End.       |
|-------------------|--------------------------|--------|-------|------------|

—An unpaid for yacht is now politely termed a float debt.

MAINE—Sebago Lake, Aug. 15.—The professional single scull race, short three miles, was won by Frenchy John (colored), of Boston, who took first prize, \$125; time, 1h. 25s. The other competitors were Driscoll, of Lowell, second prize, in 19m. 13s.; Lynch, of Salem, third prize, in the 15s.; Ross, of St. John; Saunders, of Salem; and O'Donnell, of Portland. Johnson and Alcorn forfeited double scull race.

CONNECTICUT—Hartford, Aug. 17.—Double scull race, 10 miles with a turn—Lucille, A. G. Tracy and J. P. Reiser, Lucie, F. Hyde and T. Heild. Won by the Lucie in 13m. 40s.

MASSACHUSETTS—Boston, Aug. 18.—In the Lakeman Boat regatta the race was won by the Jane, J. H. Henry, Mulhearn, A. F. Warner, W. Hennessey. The W. M. C. man second; the Rice third; Susan fourth.

New York—Palisade Boat Club, Yonkers, Aug. 17.—Annual regatta: prizes gold and silver medals. Summary:

Double scull working boats; open to residents of Yonkers not members of the club; distance two miles; three entries. Won by D. C. Rider in 18m. 50s.

One-mile Race; eight-oared barges, Resolute and Palisade, Resolute won by three lengths in 9m. 53s.

One-mile Race for pair-oared gigs; won by crew composed of S. Leo, C. Shaw, and E. Logan, Jr.; time 6m. 16s.

Two-mile Race; four-oared shells. M. F. Rowe, Uncle Bernard H. T. Keyser. The M. F. Rowe won by three feet in 11m. 35s.

THE NEW ROWING ASSOCIATION.—The meeting of representatives of the local rowing clubs at the Fifth Avenue Hotel last Thursday evening, resulted in the organization of the "Metropolitan Rowing Association of Amateur Oarsmen." There were present delegates from nearly every club in New York and vicinity; the Mystic, Nereid, Triton, Dauntless, Argonauta, Nassau, Hesper, Bayonne, Vesper, Neptune, Columbia College, Knickerbocker Athletic, Viking of New York, Nautilus, and Viking of Elizabeth, being represented by two or more members each. The constitution of the N. A. A. was taken as the basis of the regulation of the new body. The association proposes to hold an annual regatta in the vicinity of this city.

This movement, as we stated last week, is the result of general dissatisfaction among the principal clubs about New York at the selection of a point so far West as Detroit for the regatta of the National Rowing Association, and the consequent absence of any great aquatic event on Eastern waters. The dissatisfaction owes its impulse we presume to those considerations of time, distance and expense inseparable from the meeting of any so called national body. The same influences were at work here that not long since caused the disruption of the Collegiate Rowing Association. The fact is no great portion of the community is yet prepared—and we doubt it ever will be—to go long distances to participate in or witness such events. America is still in her busy money-getting and any sport involving a general outlay of time and money has much to contend against. And again, it is one thing to a community to send its representatives to a distant competition, and quite a different thing to witness that competition itself. The different sections of our country with its breadth of territory will never be satisfied with reading telegraphic dispatches of such a contest. They must be present and witness it themselves. It is in deference to this feeling that, while deprecating any spirit of sectionalism, and regretting any tendency to the free competition of the oarsmen of the whole country, we heartily endorse the organization of the newly-formed body, and anticipate for it a most happy success.

NONPAREIL REGATTA.—The annual regatta of the Nonpareil (Printer's) Rowing Club took place Aug. 20th on the Hudson River. The event passed off pleasantly despite several mishaps.

Yonkers.—The Vespers have reorganized as a Rowing and Yachting Association, with Wm. S. Carr, President; W. H. Copcutt, Vice President; W. S. Ballou, Secretary; Jas. T. Howland, Treasurer.

BOAT RACING AT CENTRAL PARK.—Miniature yachting, becoming a feature of the Saturday's sport for the young ones at Central Park. The youthful yachtsmen manifest fully as much enthusiasm over their mimic contests as do their adult brothers of the guild. The regatta on the lake next Saturday promises to be an unusually fine one.

NEW JERSEY—Long Branch, Aug. 15.—Third annual regatta of the Long Branch Rowing Association; open to all clubs. Summary:

Double scull race; short mile; prize, set of colors and medals. Won by Mann and Smith of the Argonauts and Leven and Wasted of Nautilus. Won by the latter in 5m. 40s.

Single sculls; same distance—Entries: E. Mills, of the Athletics; T. Taylor, of the Argonauts; W. Dakes, of the Nassaus, and W. T. Taylor, of the Long Branch Association. Mills won by lengths in 6m. 28s. Content, second; Taylor, third; Dougherty, fourth. Prize, a golden medal.

Four-oared race.—Entries: Argonauts, Athletics. Won by the Athletics in 6m. 55s. Prize, set of colors and medal for each man.

# National Pastimes.

## CRICKET.

ST. GEORGE'S OF NEW YORK VS. BELMONT, OF PHILADELPHIA—Hoboken, Aug. 18.—The score was as follows:

| ST. GEORGE'S.   |   | First Innings.   |  |
|---|---|--|--|
| W. H. T. Syracuse.  | — | Which do you consider the best \$50 breech-loading shot gun in use? Ans. We do not make distinctions between makers.   |  |
| J. H. N., Bridgeport, Ct.   | — | The pedigree business is in the hands of L. H. Smith, of Stratford, Chairman Com. on Pub. N. A. K. C. and by him delegated to Arnold Burgess, of Hillsdale, Mich., who is compiling the Club book.   |  |
| Stuart's Tackle.  | — | We have at last found out about Stuart's tackle. It consists of three hooks, one above the other, on a single snail. For sale by Bradford & Anthony, of Boston.  |  |
| D. P. S., Glen's Falls, N. Y.   | — | Your description of your dog's ailment is altogether too meagre to judge from. Please observe the note at the head of our Kennel column, and govern yourself accordingly.  |  |
| D. Z., Bath, N. Y.  | — | Is there any work that gives a description of the flora of Texas? The Mexican Boundary Commission Report, and the Pacific Railroad Survey are most complete.   |  |
| C. M. P., Mechanic's Falls.   | — | I have a setter pup six months old that has got crooked front legs. Please answer through your paper what to do for him and what was the cause of crooked legs? Ans. You can do nothing. There are several causes for such deformities too numerous to mention.  |  |
| N. E. S., Natchitoches, La.   | — | In the FOREST AND STREAM of July '96 appears an advertisement of Camp's Automatic Cartridge Loader. Is it what it is claimed to be and worth the price? Ans. We have seen the article, consider it very good for that purpose, and think it is worth the price (\$8).  |  |
| J. W. S., Sunbury, Pa.  | — | How can small game be put up in sealed cans so that it will not spoil during warm weather? 2. Can blackbirds be caught in a net, and how? Ans. Yes, in the same manner as other meats. 2. Yes, with the usual clap nets.   |  |
| J. J. S., Philadelphia.   | — | Would you please give me a remedy for getting rid of fleas and lice on dogs? Ans. Use Caswell, Hazard & Co's Juniper Tar Soap to wash with, and apply powdered leaves of the <i>pyrethrum roseum</i> , which may be had of Lazell, Marsh & Gardner, No. 10 Gold Street, this city.   |  |
| LEADER, Baltimore.  | — | 1. What reputation has Beckwith, of London, as a gunmaker? 2. Where can I procure the best style of wading shoes with hobbs? Ans. 1. Don't know him. 2. Frank Thomson, of 301 B'way, N. Y. can supply you.   |  |
| R. E. R., Ferrisburgh, Vt.  | — | Please give the close time for black bass in the State of New York, especially as regards Lake Champlain? Ans. Sec. 22 reads, "No person shall kill or expose for sale, or have in possession after the same has been killed, any black bass, Oswego bass or muskellunge between the 1st of January and 20th of May."  |  |
| L. D. S., Germantown, Pa.   | — | We do not know the gun referred to. Write to the parties. The route to Moosehead Lake is via Eastern R. R. from Boston, to Dexter or Guilford, thence stage. Fare for round trip, \$15. Or, you may go via steamer from Boston to Portland. You will find trout fishing, and in the neighborhood, deer, bears, ducks, grouse, etc.   |  |
| WILD PIGEON, City.  | — | Can you inform me the best time for shooting wild pigeons, and where they can be found in greatest quantity within 50 miles of New York City? Ans. Wild pigeons are very uncertain in their movements, and may be found here to-day and there to-morrow. Fall shooting of pigeons is best in September and October. We know of no place within the distance named that is notoriously abundant as regards this game.   |  |
| J. S., Pittsburgh, Pa.  | — | Where can I obtain a copy of the "Pocket Geologist and Book of Minerals." 2. Does the "Sportsman's Gazetteer" tell the localities where fur-bearing animals are found, etc. Ans. 1. From F. H. Smith, 64 Lexington street, Baltimore, Md. 2. Yes, price \$3.00 for sale at this office.  |  |
| 1. What will it cost to have the first eight volumes of FOREST AND STREAM bound? 2. I intend to visit Canada next month; will I have to pay duty on my shot-gun? 3. What fish hatcheries can I visit on my way to Kingston? Ans. 1. \$1.50 per volume. 2. No, not by obtaining a certificate from the U. S. Customs where you cross to the effect that you intend to return it to the States within a reasonable time. 3. At Pokagon, or Detroit, Michigan. |   |  |  |
| W. E. D., Lower Brule Agency, Dakota.   | — | My pointer bitch was lined by a greyhound. The litter of course will be deplorable mongrels. If she is subsequently lined by a pointer will the first or present lining have any effect upon future progeny? By some it is maintained that it will, by others that it will not; which? Ans. If this is the first time she has been lined all her future progeny are likely to be marked. If not the chances are lessened.  |  |
| C. C. C., Connorsville, Ind.  | — | I have an English gun stamped "Frim Cock, Paris and London." Is the firm one of note? Can you recommend their make? Is Nichols & Lefever guns American or London make? Can you recommend their make? Do you prefer a pointer or setter for quail? Ans. We know nothing of any such firm. American. See advertising columns for best makers; either is good.  |  |
| MICHIGAN, N. Y.   | — | Where can I obtain good sport in northern and western Mich.? Ans. Take Grand Rapids and Indiana R. R. at Fort Wayne Indiana, Kalamazoo, or Grand Rapids, Mich. All along the route good shooting and fishing may be found. In the Manistee are grayling, at Petoskey, the present terminus of the road, good trolling for Mackinaw trout may be had, and at Kalkaska good trout fishing is found. Ruffed grouse are abundant throughout the forest, and also spruce partridge, hare, and now and then sharp-tailed grouse. Myriads of wild fowl are found later in the season on the inland lakes.   |  |
| G. C. W., Brookville, Ks.   | — | In your paper of July 26, you say to prevent a bitch coming in heat give five grains powdered exsiccated alum in water night and morning. Will you please tell me in your next how many doses to give—whether five grains a day or twice a day, and if it is to be given at commencement of the bitch coming in heat, or when the proper time is to give it? Ans. Give five grains at each dose, dissolved in water. Give at first indication of the estrum and continue three days. If it does not answer by that time, there is no use of continuing it. It is a very uncertain remedy at best.  |  |
| H. H. S., Tampa, Fla.   | — | I have a Parker gun nine and a half pounds' thirty-two inch barrels, twelve bore at the muzzle, but larger everywhere else—that is, it widens from the muzzle toward the breech. Now) buck shot that chambers in the muzzle lies so loose y in the shell (brass) that I am compelled to put a wad between each layer of shot and there fore can't use the quantity I would wish, and the shooting is anything but good and the shot wedge in the shell if put in loosely. The gun shoots all kinds of small shot to perfection. Will you kindly enlighten me as to how I shall load? Ans. Load just as you have been doing; it is the only proper way. If you cannot get in shot enough get longer shells. |  |
| G. M. S., Westboro, Mass.   | — | Please inform me of the duck-shooting at Currituck Sound, N. C., and inform me of the name of some responsible boat keeper and guide to whom I can refer to; also, whether I can obtain boats and decoys there, or whether I shall take them with me. Ans.   |  |

CANADA—Stuyvesant, Ont., Aug. 14.—Collingwood vs. Stuyvesant: draw game.

Kingston, Aug. 15.—Montreal vs. Kingston; won by latter by one inning and 11 runs.

NEW JERSEY—Long Branch.—A three-mile swimming race takes place to-day between James Cunningham and J. H. Wade, who recently defeated Coyne.

CALEDONIANS.—At the meeting of the North American United Caledonian Association, held at Albany, Aug. 16, Jersey City was selected as the place for the next annual meeting. The officers for the ensuing year are: Pres., J. B. McIntyre, St. Catharines, Ont.; First Vice-Pres., Alexander Campbell, Jersey City, N. J.; Second Vice-Pres., Chief Fain, Hamilton, Ont.; Sec. George Bertram, Philadelphia, Pa.; Assistant Sec., Robert Hendric, Albany, N. Y.; Treas., Thomas Waddell, Pittson, Pa.

HARLEM ATHLETIC CLUB.—The entries for the games to be held Sept. 1 close on the 25th inst., instead of on the 18th, as previously announced.

AMATEUR ATHLETICS—Ravenswood, L. I., Aug. 20.—Handicap games; open to all amateurs; for prizes of gold medals. Summary:

Throwing the Hammer.—G D Parnly, Princeton College, 79ft 11in; Moore, 65ft 5 1/2in; C W Horton, Harlem Athletic Club, 51ft 7in.

Foot Race, 40 yards.—Entries—J Killean, scratch; H Casper, 25 yards start; White, 30 yards; F Birch, 30 yards; W Eron, 30 yards. Won by Birch in 55 seconds.

One Hundred Yards Dash.—First heat won by J A Henry in 11 seconds; H Steinert, second. Second Heat—Dead heat between H B Wilson and H Hen-lan.

Two-mile Walk, open only to subscribers to the grounds.—Entries—W H Barnes, scratch; W Wright and M H Birch, 1 minute; J Vanderhoff, 4 seconds start. Won by Barnes in 17m 10s; H second, Vanderhoff, in 17m 23s.

Hundred Yards, final heat.—H B Wilson, first; H G Steinert, second. Time, 11 seconds.

Initiating the Shot—C D Parnly, 31ft 10in; H B Wilson, 30ft 3in; C W Horton, 31ft 1in.

Five-mile Walk.—Entries—H Armstrong, of the H A C at scratch; W Van Riper, of New York; R H Pelton, of Greenpoint, and John Smith, of the Seavankata Boat Club, all of whom received 3 1/2 minutes start of Armstrong. Van Riper won the match in 46m 33s.

A MEXICAN ATHLETE.—They do these things better in Mexico, according to a veracious New Orleans paper:

A young Mexican picked up eighteen eggs by holding them like an eye-glass between his cheeks and his nose, and deposited them in his ear without using his hands; then broke the eggs between his knees and beat them into a foam with his teeth while standing on his head, and ran a quarter of a mile on his head, while he mixed the eggs and lemons in a large punch-bowl; then, without taking off his coat, he caught up with the southern-bound fast train, ran with it two miles, during which he uncorked a bottle of whiskey, mixed it in with the other ingredients and gave several of the passengers a drink through the windows, and then hopped back to the starting-point, holding the empty punch-bowl extended on the other leg, accomplishing the entire series of feats in ten minutes and a half.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

W. W. C., Milton, Pa.—See answer to J. W. S., in this column.

MASSACHUSETTS, Worcester.—Deer may be killed in Mass. from Oct. 1 to Dec. 1 after 1880.

CONY, Pa.—I would like to know the size of a 500 yard Creedmoor target. Ans. 6x6 feet.

SCRIBNER, City.—The book you mean is Hallock's "Sportsman's Gazetteer." It fills the bill exactly. Price \$3.00. For sale at this office

O. D. H., Urbana, O.—What will remove rust or tarnish from the interior of gun barrels? Ans. Kerosene.

I. L., New York.—1. Please tell me what is the price of a Remington breech-loading carbine. 2. Which country first used sliding seats in boats? Ans. 1, \$10. 2. United States.

W. G., Nashua, N. H.—Does the Game and Fish law of New York prohibit the taking of speckled trout after September 17? Ans. Yes, from September 1, to April 1, under a penalty of \$25 for each fish.

S. L. N., Millen, N. J.—Is it considered good penetration to break 30 shells with a Scott gun, 50 yards, ordinary charge of powder, No. 6 shot. Target, two newspapers folded 32 thicknesses, each tacked in each corner? Ans. Very fair indeed.

W. H. T., Syracuse.—Which do you consider the best \$50 breech-loading shot gun in use? Ans. We do not make distinctions between makers.

J. H. N., Bridgeport, Ct.—The pedigree business is in the hands of L. H. Smith, of Stratford, Chairman Com. on Pub. N. A. K. C. and by him delegated to Arnold Burgess, of Hillsdale, Mich., who is compiling the Club book.

STUART'S TACKLE.—We have at last found out about Stuart's tackle. It consists of three hooks, one above the other, on a single snail. For sale by Bradford & Anthony, of Boston.

D. P. S., Glen's Falls, N. Y.—Your description of your dog's ailment is altogether too meagre to judge from. Please observe the note at the head of our Kennel column, and govern yourself accordingly.

D. Z., Bath, N. Y.—Is there any work that gives a description of the flora of Texas? The Mexican Boundary Commission Report, and the Pacific Railroad Survey are most complete.

C. M. P., Mechanic's Falls.—I have a setter pup six months old that has got crooked front legs. Please answer through your paper what to do for him and what was the cause of crooked legs? Ans. You can do nothing. There are several causes for such deformities too numerous to mention.

N. E. S., Natchitoches, La.—In the FOREST AND STREAM of July '96 appears an advertisement of Camp's Automatic Cartridge Loader. Is it what it is claimed to be and worth the price? Ans. We have seen the article, consider it very good for that purpose, and think it is worth the price (\$8).

J. W. S., Sunbury, Pa.—How can small game be put up in sealed cans so that it will not spoil during warm weather? 2. Can blackbirds be caught in a net, and how? Ans. Yes, in the same manner as other meats. 2. Yes, with the usual clap nets.

J. J. S., Philadelphia.—Would you please give me a remedy for getting rid of fleas and lice on dogs? Ans. Use Caswell, Hazard & Co's Juniper Tar Soap to wash with, and apply powdered leaves of the *pyrethrum roseum*, which may be had of Lazell, Marsh & Gardner, No. 10 Gold Street, this city.

LEADER, Baltimore.—1. What reputation has Beckwith, of London, as a gunmaker? 2. Where can I procure the best style of wading shoes with hobbs? Ans. 1. Don't know him. 2. Frank Thomson, of 301 B'way, N. Y. can supply you.

R. E. R., Ferrisburgh, Vt.—Please give the close time for black bass in the State of New York, especially as regards Lake Champlain? Ans. Sec. 22 reads, "No person shall kill or expose for sale, or have in possession after the same has been killed, any black bass, Oswego bass or muskellunge between the 1st of January and 20th of May."

L. D. S., Germantown, Pa.—We do not know the gun referred to. Write to the parties. The route to Moosehead Lake is via Eastern R. R. from Boston, to Dexter or Guilford, thence stage. Fare for round trip, \$15. Or, you may go via steamer from Boston to Portland. You will find trout fishing, and in the neighborhood, deer, bears, ducks, grouse, etc.

WILD PIGEON, City.—Can you inform me the best time for shooting wild pigeons, and where they can be found in greatest quantity within 50 miles of New York City? Ans. Wild pigeons are very uncertain in their movements, and may be found here to-day and there to-morrow. Fall shooting of pigeons is best in September and October. We know of no place within the distance named that is notoriously abundant as regards this game.

J. S., Pittsburgh, Pa.—1. Where can I obtain a copy of the "Pocket Geologist and Book of Minerals." 2. Does the "Sportsman's Gazetteer" tell the localities where fur-bearing animals are found, etc. Ans. 1. From F. H. Smith, 64 Lexington street, Baltimore, Md. 2. Yes, price \$3.00 for sale at this office.

1. What will it cost to have the first eight volumes of FOREST AND STREAM bound? 2. I intend to visit Canada next month; will I have to pay duty on my shot-gun? 3. What fish hatcheries can I visit on my way to Kingston? Ans. 1. \$1.50 per volume. 2. No, not by obtaining a certificate from the U. S. Customs where you cross to the effect that you intend to return it to the States within a reasonable time. 3. At Pokagon, or Detroit, Michigan.

W. E. D., Lower Brule Agency, Dakota.—My pointer bitch was lined by a greyhound. The litter of course will be deplorable mongrels. If she is subsequently lined by a pointer will the first or present lining have any effect upon future progeny? By some it is maintained that it will, by others that it will not; which? Ans. If this is the first time she has been lined all her future progeny are likely to be marked. If not the chances are lessened.

C. C. C., Connorsville, Ind.—I have an English gun stamped "Frim Cock, Paris and London." Is the firm one of note? Can you recommend their make? Is Nichols & Lefever guns American or London make? Can you recommend their make? Do you prefer a pointer or setter for quail? Ans. We know nothing of any such firm. American. See advertising columns for best makers; either is good.

MICHIGAN, N. Y.—Where can I obtain good sport in northern and western Mich.? Ans. Take Grand Rapids and Indiana R. R. at Fort Wayne Indiana, Kalamazoo, or Grand Rapids, Mich. All along the route good shooting and fishing may be found. In the Manistee are grayling, at Petoskey, the present terminus of the road, good trolling for Mackinaw trout may be had, and at Kalkaska good trout fishing is found. Ruffed grouse are abundant throughout the forest, and also spruce partridge, hare, and now and then sharp-tailed grouse. Myriads of wild fowl are found later in the season on the inland lakes.

G. C. W., Brookville, Ks.—In your paper of July 26, you say to prevent a bitch coming in heat give five grains powdered exsiccated alum in water night and morning. Will you please tell me in your next how many doses to give—whether five grains a day or twice a day, and if it is to be given at commencement of the bitch coming in heat, or when the proper time is to give it? Ans. Give five grains at each dose, dissolved in water. Give at first indication of the estrum and continue three days. If it does not answer by that time, there is no use of continuing it. It is a very uncertain remedy at best.

H. H. S., Tampa, Fla.—I have a Parker gun nine and a half pounds' thirty-two inch barrels, twelve bore at the muzzle, but larger everywhere else—that is, it widens from the muzzle toward the breech. Now) buck shot that chambers in the muzzle lies so loose y in the shell (brass) that I am compelled to put a wad between each layer of shot and there fore can't use the quantity I would wish, and the shooting is anything but good and the shot wedge in the shell if put in loosely. The gun shoots all kinds of small shot to perfection. Will you kindly enlighten me as to how I shall load? Ans. Load just as you have been doing; it is the only proper way. If you cannot get in shot enough get longer shells.

G. M. S., Westboro, Mass.—Please inform me of the duck-shooting at Currituck Sound, N. C., and inform me of the name of some responsible boat keeper and guide to whom I can refer to; also, whether I can obtain boats and decoys there, or whether I shall take them with me. Ans.

Duck shooting is good in season. Everything needed can be found at the club house of the Currituck Shooting and Fishing Club, where good board may be obtained, etc. Hallock's "Sportsmans Gazetteer" gives full information. Price \$3. For sale at this office.

E. A. S., Philadelphia.—I have a Skye terrier puppy thirteen weeks old which is in a very dangerous condition. He is very small, weighs but thirteen ounces and has got the distemper very bad. What can I do for him. He walks with great difficulty and his breathing is labored. Ans. A rational treatment of so-called distemper cannot be given in these columns as it would occupy too much space. You may give, however, 1/2 grain of muricide of ammonia and 1/2 grain of leptandrin every two hours, using small doses of quinine when pulse is high. The book you want is Hallock's "Sportsman's Gazetteer," which will teach you how to treat the dog and give all other information you desire regarding breeds, etc.

S. D. H., Allentown, Pa.—I have a setter bitch two and a half years old with canker; shakes her head considerably; have bathed it with solution of sulphate of copper. It relieves her for the time; cannot I cure her permanently? If so, how? Ans. The sulphate of copper treatment is useless. Give the dog 6 drops of Donovan's Solution in water three times a day, taking care not to give on an empty stomach. As you do not say whether the canker is external or internal, we cannot prescribe further. If you will follow the directions to be found in Hallock's Gazetteer you can cure your dog permanently. Wash your dog with juniper tar soap (Caswell's), and wash the ear with castile soap and tepid water, by means of a P. P. syringe.

F. G. S.—Can any of the men of science contributing to your valuable paper give me any information in regard to the mussels of the Ohio River and its tributaries? How many varieties are there and are they all edible, and if so at what season of the year? Ans. We presume that the bivalves referred to belong to the genus *Unio* of which very many species have been described; a majority of them are probably merely varieties. For information concerning the genus consult Blaney's "Fresh Water Mollusks," the publications of the Philadelphia Academy of Sciences and of the American Philosophical Society in which Dr. Isaac Lea has described many species. See also Gould's Invertebrates of Mass. "The Naturalist's Agency, Salem, Mass., can supply the above works.

CONSTANT READER, Rouse's Point.—Please inform me as to the bird I have killed, etc. 2. Also let me know what will make my dog eat? He has no appetite. He is quite thin, and his coat looks bad. 3. Let me know also where I can procure game laws of this State and what they cost. 4. Please let me know what to do for my dog. He got bit on the hip and I let it go too long till now it is a running sore and it begins to swell. What will make a dog fine in his coat? Ans. 1. Your description is entirely too meagre to decide from. The description as given applies to nearly all the waders at some stage of their existence. Describe bill and feet and all the markings. 2. Cannot tell what is the matter with your dog from your description. You can get a copy of the game laws at this office; price fifteen cents. 3. Touch it lightly with lunar caustic, then apply the following: Mercurial chalk, ten grains; powdered sub. carbonate of lead, three grains; powdered willow charcoal, five grains; simple cerate one half ounce, made into an ointment. 4. Khubarb, six drachms; powdered white Castile soap, two drachms; Septandrin and powdered cubeb, each one drachm. Mix. Dose, 4 grains three times a day. You ought to have Hallock's "Gazetteer." It would answer all the questions. Price \$3.00; for sale at this office.

—Undoubtedly one of the best and cheapest stocks of Carpets, Oilcloths, Matting, etc., to be found in the United States is that of Messrs. JOHN H. PRAY, SONS & CO., Washington street, Boston. I. W. Adams is the sportsman of the firm, and will take special pains to please any of our friends calling upon him or with any orders sent him. It is a good, reliable house.—[Advt.]

CANADA.—There is a most interesting widow in that appropriately-named town, Hazardville, Conn. This lady has lost five husbands by powder-mill explosions. Is she alarmed? Is she discouraged? Not at all. She is about to be joined to the sixth, and he is a powder-miller also.

CARRIER PIGEON CONTESTS.—Pigeon matches are coming into vogue in this State. The sport is said to possess all the requisites of an exciting pastime, and promises to become popular. We fear, however, that its interest depends too exclusively upon the race course system of betting. Blase frequenters of the turf may now vary the routine of putting their change upon the gray horse by betting on the red-checker cock or the blue-checker hen.

## New Publications.

THOMPSON'S GARDENER'S ASSISTANT. New edition revised and extended.

Of the new edition of this work, revised by Dr. Moore, of the Chelsea Botanic Gardens, London, and of which we have just received the first six numbers, we can only speak in the highest praise, and fully recommend it to all who are in any way interested in horticultural pursuits. Its aim is to explain in a simple and concise manner the principles on which the practice of horticulture is founded, and to give an account of the most approved modes of working. With this view, instructions are given for the execution of the principal operations in gardening and minute details respecting the most approved modes of cultivation.

After a complete calendar of operations for each month, such explanations respecting the organs, growth and nutrition of plants as is necessary for the due comprehension of the principles on which successful cultivation depends, follow. The nature and properties of soils; the various kinds of manure; the different tools, instruments and machinery most advantageously employed, etc., are fully explained. The best situation, soils and form, for the fruit and vegetable garden; draining, grading, etc., described. Next comes the best ascertained varieties of vegetables, the art of propagation, especially with regard to budding and grafting; the operations of pruning and training fruit trees, too often neglected in this country; to be followed by ample descriptions of the different kinds of garden structures, and the principles of heating the same, with the view of introducing systems combining the most perfect results with the utmost economy; the laying out, and especially the management, of the flower garden, and pleasure grounds, with special cultural hints on the most desirable hardy trees, shrubs, bulbs, annuals and budding plants; to conclude with a section on the management of greenhouse and stove plants, including palms, orchids, ferns and succulents, with lists of the most desirable, written by practical cultivators, and which will be found of the highest value by those interested in the culture of these subjects. It is amply illustrated by colored plates and over 300 figures and designs, and is published by Blackie & Son, London and Glasgow, and 15 Dey street, New York.

## SUMMER RUSTICATING.

## A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

## CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, Aug. 24.—Trotting: Earlville, Ill.; Poughkeepsie, N. Y.; Pittsburgh, Pa.; Meadville, Pa.; Hillsdale, Mich. Base ball: Live Oak vs. Lowell, at Lowell, Mass.; Crystal vs. Active, at Brooklyn; Indianapolis vs. Rochester, at Rochester. Creedmoor: Infantry, 5th Brigade, 2d Div.

Saturday, Aug. 25.—Trotting: Hillsdale, Mich. Base ball: Cincinnati vs. Hartford, at Brooklyn; Louisville vs. Boston, at Boston; Chicago vs. St. Louis, at St. Louis; Nameless vs. Witoka, at Brooklyn; Volunteer vs. Star of Greenville, at Poughkeepsie; Active vs. Buckeye, at South Brooklyn; Journey & Burnham vs. Jos. O'Brien, at Brooklyn; Produce Exchange vs. Osceola, at Brooklyn; Lafayette vs. Putnam, at Brooklyn; Orange vs. Wilkesbarre, at Orange, N. J.; Hornell vs. Danville, at Hornellsville; Athletic vs. Lochner, at Philadelphia; Indianapolis vs. Rochester, at Rochester. Creedmoor: Fourth competition for Remington prize of \$300 in gold; third competition for Turf, Field and Farm Badge; Seventh Regiment Rifle Club competition for "Shields" and Remington Special Military Rifle; New York Athletic Club Swimming Match; Rowing match between Watson and Peacock, Passaic River; Amateur Swimming Tournament, Harlem River.

Sunday, Aug. 27.—Trotting: Cambridge, Del. Base ball: Orange vs. Wilkesbarre, at Orange; Indianapolis vs. Syracuse Stars, at Syracuse. Creedmoor: Infantry, 11th Brigade, 2d Div.

Tuesday, Aug. 28.—Trotting: Cambridge, Ill.; Parker City, Pa.; Hartford, Conn.; Oskaloosa, Ia.; Macomb, Ill. Base ball: Cincinnati vs. Hartford, at Brooklyn; Louisville vs. Boston, at Boston; Indianapolis vs. Syracuse Stars, at Syracuse. Creedmoor: Practice of American Team.

Wednesday, Aug. 29.—Trotting as above. Regatta of Nahasset Yacht Club off North Shore. Creedmoor: Seventh Regiment competition for regimental medals.

Thursday, Aug. 30.—Trotting as above, and at Hudson, Mich. Base ball: Cincinnati vs. Boston, at Boston; Louisville vs. Brooklyn, at Brooklyn. Regatta of the Newburgh Rowing Association. Creedmoor: Infantry, 1st Brigade, 1st Div.

**LONG-RANGE SHOOTING.**—We are in receipt of advance sheets of a new work entitled "Long-Range Shooting," which will be issued next week. It is a complete history of the International rifle matches of 1873 to 1877, and a treatise on the rifle and on rifle practice; also a history of the Elcho Shield, etc. It is a handbook that no riflemen can afford to do without it. The fact that it is edited by the rifle editor of the FOREST AND STREAM AND ROD AND GUN, is sufficient guarantee of its correctness and general merits. Published by the Forest and Stream Publishing Company.

—Hon. J. D. Catton, Chief Justice of Illinois, called on us last week while on his way to Cape May. We can only wish the call had been longer.

IN June, when the trees are all leaved and "Nature smiles serene," you decide that the country will not be honored with your presence this year; but when August comes, and all your neighbors are gone, and the workmen at the little chapel next door—which is undergoing its annual repairs (and when is it not?)—keep up such a racket that your head is like the interior of a saw mill, you begin to anathematize your comfortable home, and eulogize the "green fields," "shady lanes" and "pure air" of country retreats. You close up your pleasant, roomy house with its high ceilings, its soft carpets and easy chairs; its gas, hot and cold water, and the water cooler and never-failing supply of ice; with the smoothly shaven lawn and croquet ground, pleasant yard, well-kept walks and cool afternoon breezes; with the drug-store in the second block and the doctor close by. You scoff at these things, and recklessly pepper the carpets, camphor your winter clothing, swathe the furniture, nail your windows down, send your silver to the Safe Deposit Co., your husband out West, pack a Saratoga, a band-box, a valise, a shawl-strap, a box of books, another of plants, a case of ferns, turn over the house to the care of a couple of "hoodlum" boys, and go to the country.

You get there just about dark, tired and weary after a three-mile ride in a double wagon over a road that is by no means pavement, where you find some more unfortunates still more miserable than yourself, all having a "delightful time"—Ugh! At last you retire for the night, and what a night it proves to be! All the mosquitoes in the State congregate to greet you, and hold high carnival over your arrival. One bites you, then another probes you; then they all bite with a unanimity of purpose perfectly astonishing, and lift up their voices in high notes of joy. Lights appear and disappear at each fresh bite to assist in applying cologne water, camphor, salt, soda, soap, kerosene, carbolic acid and other applications which your friends have recommended, and which have proved futile on each successive application, to allay the sting. Numerous-legged bugs of divers sizes, colors and voices make alarming aerial flights from unexpected places, and come violently in contact with the ceiling and rebound upon yourself, and crawl upon your neck with hooked claws and beaks like a pair of ice-tongs. At last, after you have killed bugs enough to stock a museum, and filled the wash-bowl, or distributed them upon the window-sill, and the mosquitoes are fed and hung up upon the wall—that is, those that are left after hunting them vigorously with a slipper for two hours,—tired Nature asserts itself, and you are fast approaching the land of dreams. You have not been asleep but a moment, seemingly, when you are startled back to earth by a hideous roar, a wierd, cavernous sound that causes visions of the resurrection and judgment to flit o'er your frantic brain. A muttered word of encouragement, and ardent wishes for the eternal health of that pair of lungs, to which, if wicked, you mentally add, "I'll soap that horn before the day is out," and you again attempt to sink into unconsciousness. But then the cows come up and moo around, and one of them wears a bell which rings incessantly, and puts the junkmen at home to shame; the pigs grunt and squeal for their morning meal, and the hens cackle, turkeys gobble, ducks quack, geese *hauwagh*; all the horses have to be watered, and they all whinny, and the dogs bark; and, as it becomes unbearable, that horn toots again with a violence that would make it heard upon the Danube, and silence remains thereafter for the space of fifteen minutes.

That quiet means breakfast, and you are just congratulating yourself that you will not be obliged to get up after all, when Pandemonium resumes its sway. The farmer and his men come out to yoke the oxen and harness the horses to go to the fields, and all are gifted with cast-iron lungs and knife grinding voices. The oxen are geed, whoaed, hawed, backed and darned till they attempt to go in seventeen directions at once, and a dreadful "black snake" makes an incipient Fourth of July. At last the "critters" are harnessed and yoked, the boys run hither and thither collecting shovels and scythes, which they stop to ring against stones, or to sharpen, and the farmer who takes a few "select city boarders to give them all the comforts of home"—God forbid!—stands in the barn-door and gives orders to a man in San Francisco, while an idiot at the back of the shed monotonously splits wood and throws it in a pile, which serves to fill the intervals of silence which otherwise might possibly occur. Just as all this shows signs of yielding some one comes tip-toeing to your door with a softness to be heard a mile, who, fondly imagining you have slept through all the infernal racket, knocks fit to wake the dead, and coolly informs you that breakfast is ready, and that it's six o'clock. You opine from this that six o'clock is a late hour, and with an unearthly sigh you reply, "Very well! I'll be down in a minute," and proceed to dress, your head meantime ready to split with the luxury of "country life in a retired and quiet neighborhood," etc. *Vide* advertisement.

You would have had breakfast for breakfast, but the perambulating meat man failed to put in an appearance yesterday. You would have had cream in your coffee if the cows had not got out of the lot and eaten leeks. New potatoes are not large enough to eat, and the old ones you are served with have been frozen, or have sprouted, and consequently have a pre-historic flavor. The hens, you heard, hide their nests, so but few eggs are to be had, and those they are obliged to send away to fill a contract, or to pickle for winter use. The hams that were smoked first are all gone, and those that were smoked last are not yet cured. There's po—, the unclean beast, there's always that; but you don't fancy the animal. So you, take some bread,

which is made from salt rising and is a cross between beach-sand and sawdust in flavor, and some butter which is frowy—the good butter has to fill contract also; and drink some creamless decoction of rye, flavored with "short" sweetening, and hope for better things. So you stay two weeks, and all the days and nights are but repetitions of the first, with now and then an unexpected departure in the shape of sick head aches, "gastric griefs and peristaltic woes," and the doctor three miles off, which allows the farmer's wife an opportunity to administer hop pillows, poultices, mustard and onion draughts, and nauseous compounds of "roots and yarbs"—the latter of which have a "leetle camp-fire and pain-killer" which transforms you into a miniature Vesuvius. It works like a charm however, for your fright at being poisoned or burned up drives away the pain, and you remain the rest of that scorching August day deep in the big feather bed, drinking stale water from the well (which is supplied from the frog pond just down by the corner of the barn) and sigh for the cool mattress and ice-water of the city. But when two weeks are up you feel that forbearance ceases to be a virtue, and you write the boys to meet you at the Grand Central, for you are longing for home. Do you come? Not much! On the appointed day you telegraph you can't come, for your heart fails when you remember that the Smithses and Simpkinses and Heterogenicognomenses are not home, and you telegraph that you are not coming till the month is over after all, and that you are having such a *sweet* time, and turn to read the enlightening "Mysteries of Rodolpho," or of "Casper the Cross-eyed Carpenter of Kalamazoo" and such other literature as the house affords. Meantime, the boys are going to the dickens; for, unfortunately, they can't and don't want to appreciate the beauties of the country.

## OUR GAME.

IT is an absurdity to say that the spread of civilization and culture has destroyed the game, for it is a well known fact that game of all sorts increases in the very same ratio in which cultivation increases, if left unmolested in their seasons of reproduction, nesting, spawning or tending their helpless young—so long as a sufficiency of woodland is left to afford them shelter.

The above sentiments were penned by Henry William Herbert, thirty-five years ago, and their truthfulness and prophetic unctious is more apparent in these later days than when the immortal author of "The Warwick Woodlands" first brought them to the attention of the public in "Graham's Magazine." His reference to game was of course the smaller varieties, the feathered denizens of our fields and forests, comprising the quail (*Ortyx virginiana*), the woodcock (*Philohela minor*) and the ruffed grouse (*Bonasa umbellus*). All of these are non-migratory, depending upon something more than natural food, the woodcock excepted, but as this little fellow's migrations are short and do not interfere with the rearing of its young, and as he also depends more or less for subsistence on the ungarnished grain, we can class him with the others as unaffected in point of plentitude by the encroachments of civilization.

The larger game, such as the deer, elk, moose and wild turkey, as well as those quadrupeds not strictly game, but affording great sport with a dash of danger to the gunner; the bear, wolf, wildcat and panther, have long since passed away. But none of these levy extensively on the farmer's industry for their support. Their disappearance from the face of the land is not so much owing to the presence of man, as from a lack of cover wherein to roam unmolested and procure their natural food, and bring forth and nurture their young.

In studying the habits of the quail, woodcock and ruffed grouse, and in comparing their present numbers with those of a decade past we find them more plentiful, and do not hesitate in saying that it is the advance in culture and civilization that has caused the marked increase. Quail are much more liable to be found on clean, well kept farms, than on those weedy, unkempt tracts undeserving of the title. So long as good protective laws are passed and enforced, just so long will "Bob White" flourish and increase in our rural districts. The more farms and farmers there are, and the better they till their land, the more quail will there be, for better cultivation means better grain and more of it; and as our little friend is a good deal of a gourmand, rest assured he will never desert the husbandman so long as he provides for his wants, and protects him during the close season. And so with the ruffed grouse, or partridge as he is called by us in New York State. Although he inhabits our hill and mountain sides where the ground is roughest, and the cover the most thoroughly impenetrable, and is somewhat of an autocrat, yet he sometimes condescends to come down from his mountain fastnesses, and take his fill of the farmer's grain. In fact there are seasons when he depends to a great extent for his daily food upon the stubble fields, and in the early fall when the foliage is still as thick as in midsummer making the pursuit of the grouse in his native haunts a bootless enterprise. To capture him at this season you must find some sloping stubble field bordered on its upper side by a belt of scrub oaks and evergreens; repair there some September morning before sunrise, wait patiently, and two to one, *bonasa* will appear hopping through the snake-fence dividing his domain from the field, and after carefully viewing the landscape o'er for signs of crafty fox or dreaded hawk, and giving a preliminary strut or two, will commence picking up the scattered grain. Then shoot him, sitting as he is; for you are justified in so doing, and I hold that it is neither mean nor unsportsmanlike to take any advantage of the ruffed grouse, providing you shoot him fairly and in season. Some

## GAME PROTECTION.

PENNSYLVANIA.—At a late meeting of the North Philadelphia Game Protective Association the annual election for officers was held with the following result: President, Henry R. Allen; Vice-President, John Clapp; Treasurer, C. E. Webster; Secretary, J. E. Byram.

MICHIGAN.—The following amendment to the game law was made at the last session of the Legislature:

Sec. 1. That no person or persons shall pursue or hunt or kill any wild elk, wild buck, deer, or fawn, save only in the Upper Peninsula, from the 1st day of August to the 15th of November, and in the Lower Peninsula from the 15th of September to the 15th of December in each year, or kill or destroy by any means whatever, or attempt to take or destroy any wild turkey, at any time during the year except in the months of October, November and December of each year, or kill or destroy by any means whatever any woodcock between the 5th of July and the 1st of January, or any prairie chicken or pinnated grouse, commonly called partridge or pheasant, or any wood duck, teal duck, mallard duck, or gray duck, save only from the first of September in each year to the 1st of January next following.

—John Foutch, the great coon-killer of Madison County, Tenn., now in his sixty-ninth year, says that "from roasting to roasting-car time," he has killed, with the aid of two dogs, 269 coons. His neighbors pay the tax on his dogs.

SPRINGFIELD, Aug. 11, 1877.

EDITOR FOREST AND STREAM:

I have read Dr. John P. Ordway's two letters concerning the Mass. game law, together with Mr. Minot's timely suggestions. I am aware that the law is not perfect, but it is far from being as imperfect as Dr. Ordway claims. I am not one who believes that even with the aid of the Mass. Anglers Association a better law could have been passed last winter. The sportsmen of Massachusetts have to meet the entire hotel and saloon interest of Boston whenever an efficient law is asked for to protect game, and this interest is backed by their money. We were beaten by them in 1876, and were obliged to concede to them the objectionable clause in the bill of this year, or be beaten again; and it was not because we lacked the large advice and accumulated wisdom of the "Angler's Association." The sportsmen knew what we wanted; we took the best we could get, and bide our time.

The law makes possession *prima facie* evidence to convict. Dr. Ordway very kindly makes proclamation to pot-hunters and poachers that this means nothing—in substance, that an evasion and a lie will pass muster in a Massachusetts court if stuck to long enough. This won't do. A cannot buy woodcock of B, and then when he is prosecuted say that B told him they were killed in town; but the game being found on his possession the statute, as it now is calls upon him (A) to control and overturn the presumption of guilt put upon him by the illegal possession, and unless he can do so I believe the Courts would convict, as they ought.

It is a notorious fact that the game law is, and always has been, violated in Boston with impunity, and simply because sportsmen in that city do no try to suppress the violation. I am aware that this is a strong statement, but the sportsmen there will concede it. Because it is the "Brunswick" or the "Parker" or "Young's" who violate thus the law, most sportsmen lay finger upon lip and cry "hush."

Living as I do, one hundred miles from the "hub," I am importuned weekly by letters from sportsmen in and about Boston hailing me with the old Macedonian cry, "Come over and help us." In reply I say, "Help yourselves."

We keep this end of the State right, and I will give Dr. Ordway twenty-five dollars apiece for all the woodcock he can find in this county dead out of season.

How much better it would be for Dr. Ordway to test the law by an experimental prosecution, energetically pushed by good counsel, than to sit on his seat and confess judgment without trial, "because I (he) should not personally feel willing to risk the reputation of our society by obtaining warrants under the present law." If his Society exists solely to preserve its reputation, let us know it. The people and the legislature when it granted the charter of said society supposed its purpose was a different one, and if it was not, why then, dear Dr., in good faith have its title changed again.

Mr. Hallock's comments on the law, and your editorial ones in the last issue are easy writing, but just tell Hallock it "is easier to write a book" than to engineer a perfect game law through a legislature.

E. H. LATHROP.

SUNBURY, Pa., Aug. 6, 1877.

EDITOR FOREST AND STREAM:

"Verde Monte's" article on "Migratory Quail," in your last number (Aug. 2), should attract the attention of every club and every sportsman in our northern latitudes. I intend to introduce it to the notice of our association at our very next meeting, and shall watch the development of this experiment with the greatest interest.

The value of acquiring a new variety to our list of the *ortyx* family which is capable of protecting itself from almost annihilation by the severity of our northern winters, is almost beyond computation, while the cost is a mere bagatelle. To the sportsman who essays open field shooting as more pleasurable than the more arduous close cover, any accession of new varieties and numbers will be hailed with delight and the "Rotund Fur Co." If its introduction proves the success it promises, will have conferred a blessing which should make its "memory ever green."

A. F. CLAPP.

—George Gillespie of Wayne County, Pa. In the woods of that town, recently had a severe encounter with a catamount. The brute weighed sixty pounds and measured, forty-one inches in length.

ly ever be refused when sought for through proper letters of introduction. If sportsmen will use the same effort and precaution to secure letters of introduction that they do to secure reserved seats at a concert, or state-rooms on a steamer, they will fare equally as well in the field or hill cover. As a measure of protection the system of posting is doubtless one of the best; and the selfish plea that the farmers keep their birds to trap for their own private emolument or pleasure, will not go beyond the limit of perhaps one in ten of all who own territory where game birds fly or feed.

On the division of the railroad between Pittsburg and Alliance is a veteran conductor named Theodore Gray, who resides in Alleghany City. He is a natural born sportsman, has been on the road twenty years, and is known to every farmer on the route. He seems, too, to know every place where the birds breed. He took pleasure in pointing out to us choice spots in Ohio where game can be shot next October when the law is off. He says that birds will be abundant, and I incline to the opinion that the measure referred to above and a temporarily extended close season have produced the happy result. Any one going West will find the best accommodation on the Pennsylvania Central and Pittsburg and Fort Wayne Railroads, with sleepers and hotel cars attached, where one can not only "live, move, and have his being," but live and have his being without moving much. There is a most comfortable refectory at the Fort Wayne Depot, which is kept by the gentleman who is manager as well of the magnificent "Manhattan Beach Hotel" at Coney Island in New York Bay.

Leaving Fort Wayne on the 7 A. M. way train for Grand Rapids, a journey that would seem long compared with the time made by the through night express, is made delightfully pleasant by the scenery along the route. The country is interspersed with limpid lakes and green groves of oak, luxuriant fields and fruitful orchards, pretty hamlets and bustling towns; and when the tourist passes into Grand Rapids, the queen city of Michigan, the preparatory stages of the transition have toned down what would otherwise prove a sensation of surprise into a feeling of satisfaction that his expectations have been fully realized. Although I passed two days and one night in Grand Rapids, doing the town as well as thorough-paced horseflesh enabled me to do, the time was insufficient to take in half its local attractions. On my return from this northern section I may feel moved to descend upon them but not here, as I am on the wing.

From Grand Rapids to Petoskey, the terminus of the Eastern branch of the Grand Rapids and Indiana Railroad, the latter half of the route runs chiefly through the dense pine and hard-wood forests of northern Michigan; but at frequent intervals are little hamlets with their buildings all new, and odoriferous of freshly-cut lumber. Evidences of busy thrift, and incoming settlers who are happy with their choice of locations, are seen in the buzzing saw-mills, the tall corn and clustering potato patches, the improved farm implements and the contented kine. Petoskey, is the terminus of the railroad and a landing for the lake steamers that ply to the North and the South. It has been built within five years, but its growth, though rank, is substantial. There are two or three hotels here which are thriving upon the ever-changing multitudes of tourists and prospectors; there are several stores also. All the modern appliances of summer resorts are to be found here, and possibly a huge lake-side hotel will spread its broad verandas here anon. Over the blue waters of Little Traverse Bay the grand view extends, and as I write I see the surface placid as a mirror. I feel the bracing air in my lungs, and its vivifying effects upon a debilitated system. I feel that it is indeed good to be here. Presently the steamer lies away to Charlevoix, thirty miles southward. I am booked for a passage, and must close these hasty notes, or miss it. In my next I hope to write something more interesting about the country.

HALLOCK.

INTERNATIONAL EXHIBITION.—The Permanent International Exhibition now open at Philadelphia, offers facilities such as were never before presented for the examination and comparison of all the various styles and qualities of manufactured goods that are placed on the market. It has surprised all who have visited the exhibition to find so grand and complete a display of American industries, while the grouping of exhibits in classes is admirably adapted to facilitate comparison. An invitation has been extended to the Governors of all the States and Territories of the Union to visit the Exhibition during the last week in August, for purposes of general conference. It promises to be a notable event, and arrangements are being perfected to make the visit highly enjoyable to the participants. The programme includes a preliminary meeting at Independence Hall, on Tuesday, August 28th; a formal reception at the Exhibition by the exhibitors and Management, on Wednesday; a grand industrial parade from the manufactories of the city, reviewed by the Governors, on Thursday; visiting leading manufactories, on Friday; a visit to Cape May over Sunday.

NEW MAP OF NEW YORK.—Messrs. D. A. Edstall & Co., of No. 14 Broadway, have just issued an elegant little "Citizens' and Travelers' Guide Map In, To and From the City of New York and Adjacent Places." It is printed upon bank note paper, is handy for the pocket, and enables the traveler to dispense with a hack or hunting a directory in order to find his way about the city. A glance shows the names and locations of the prominent churches, hotels, places of amusement, and public buildings, also the location of the piers of all ferries, foreign, coastwise, river and sound steamers, The elevated and street railways are so clearly indicated by the lines, arrows and signs referring to the directory of the time, that traveling in or out of the city is made easy even to those unaccustomed to city travel. Price 25 cents.

may take issue with me relative to this, but I can only say that when we get this prince of game birds to lie to a dog, allowing his pursuers to get within forty yards before flushing, then and not till then will I say it is unmanly and unsportsmanlike to shoot him sitting. There are sportsmen living in our best grouse districts, clean, quick shots, who every fall bag quail by scores, who think they do well to kill a half-dozen grouse in a whole season's shooting. I have seen the statement made that the quail, owing to his rapid flight and the small surface presented to the sportsman's shot, was the hardest game bird to kill that flies, but he don't compare with the grouse darting through the underbrush, dodging branches and tree trunks in his erratic flight. Then stalk him as you would a deer, be guided by his resonant drumming as he struts and plumes himself upon some mossy log, and I'll warrant you, barring traps and snares, the stock will not be much reduced, shoot him as you will.

Of course Herbert took into consideration that increase in culture and civilization, meant an increase in sportsmen. The fact that to day the ranks of the great, well armed, yet gentle and peaceful sporting army are rapidly filling up, is not owing to a sudden fancy taking possession of the public mind, prompting the people to buy guns and rush to the field *en masse*, there to indulge in frantic efforts to slaughter game, but to a careful consideration by thinking men of the noble, exhilarating and health-giving properties of field sports, inculcated by the efforts of our prominent field journals. The additions to the guild are from the higher orders in life; and this being the fact, and the mania spreading through our rural districts just in proportion as civilization and culture increases, there is no danger of an extermination of our game. With so many gentlemen sportsmen in the field, with so many cultured and refined landholders and farmers, our game will be protected, their nesting and rearing times held sacred, our legislatures will narrow down the open seasons to that point which a knowledge of the habits of game shows to be the most advisable, preventing the stock from becoming depleted by a too long thinning of their ranks. In times of severe winters—which, by the way, is a more to be dreaded evil than an army of "pot hunters" and snarers,—the granaries will be opened, and their contents distributed with no niggard hand for the benefit of the helpless, starving innocents. So can we say that "the signs of the times" point to a glorious future for sportsmen, and it will not be long, believe me, until game of all varieties will be plenty all over our broad land. H. W. DE L.

## STRAY NOTES FROM THE EDITOR.

PETOSKEY, Mich., Aug. 14, 1877.

My last waif was from Pittsburg, August 4. The same day I took train for Grand Rapids, Mich., via Fort Wayne, Indiana, where I was obliged to stay over Sunday, because there is no connecting through train on Saturday night. The detention, however, was made very pleasant by the courtesies of our Fort Wayne friends, Messrs. Olds, Miller, Fowler, McKenna, Bond, and others. Mr. Fowler has a fine set of pups out of the celebrated Rufus and Ranger, of which he is justly proud; and there are other dogs in town which boast an aristocratic pedigree. Harry Olds' chief trophy is the head of a seventeen-pound maskalonge which he recently captured with an eight-ounce trout rod. His private collection of the fauna common to this section, is very fine. The numerous sportsmen of this thriving town once formed an influential club which seems to have disintegrated from lack of cohesion; nevertheless, although it has no recognized existence, the spirit of the body corporate remains, and the recurrence of the shooting season never fails to bring the sportsmen to the front, and the game to bag in due time. The country between Alliance and Fort Wayne, on the Pittsburg and Fort Wayne Railroad, and between Richmond and Fort Wayne, is dotted with bass lakes and well stocked with quail. There are many woodcock also, but shooting is generally prohibited without permits from the tenants, the lands being for the most part posted, a measure of protection which I am greatly inclined to favor, as it saves the birds while it debars no one from sport who is worthy to bear a letter of introduction to some one of the farmers from a mutual friend. Some, who do not seem to comprehend the fact that this is a growing country, rapidly acquiring a dense population, think it a hardship because they cannot rove at random over territory which was almost a wilderness when their fathers were boys. Property rights are recognized by boundary lines which become more and more respected as they contract. The garden-patch is sacred from intrusion while the hundred-acre lot is not; and any decent man who is welcome to a parlor will hesitate to intrude into the private chamber of his host. There is no more reason why a farm should be free to all comers than that the implements and products thereon should be common property to those who covet them. No stranger thinks of engaging in any transaction of a business or social character, however trivial, without a letter of introduction; and surely the same spirit of deference should actuate the sportsman who wishes to shoot over a man's farm or inclosed territory. Of course, where large tracts are without discernible boundaries, or in forests, one cannot discriminate; nor can the law of trespass be any more easily enforced than it used to be a hundred years ago. When our country becomes as densely populated as Great Britain, we shall not only find every acre posted, but shall have to submit to licenses and gun taxes as well. Let us enjoy what privileges we have while they remain, and be contented to get, for the asking, what we don't deserve when we attempt to take it without asking. If any man objects to our shooting on his land, we can go to the next farm. Permission will scarce-

## OUR WASHINGTON LETTER.

WOODCOCK SHOOTING—COLUMBIA LONG-RANGE RIFLE CLUB  
—BASS FISHING—SHOOTING AND FISHING AT THE VIRGINIA SPRINGS, ETC.

[FROM OUR SPECIAL CORRESPONDENT]

WASHINGTON, D. C., Aug. 18, 1877.

AMERICAN woodcock (*Philohela minor*), the most delicious of all game birds, is now quite abundant in this vicinity, and many have been killed within the past two or three weeks. It must be remembered, however, that woodcock shooting though a beautiful, at times, a very laborious sport, and the excessively hot weather has prevented many of our sportsmen from its enjoyment. Just now when the weather is close and sultry, the birds are found in the covered swamp, there being many such places within an hour's drive of Washington affording them excellent shelter. I have known of a few instances where six or eight have been killed in an afternoon, but they are not so plentiful as they were in the days of Audubon, when he wrote of the woodcock as follows:

"It is, however, killed in almost incredible numbers from the beginning of July until late in the winter, in different parts of the Union, and our markets are amply supplied with it during its season. You may at times see gunners returning from their sports with a load of woodcocks, composed of several dozens; nay, adepts in the sport have been known to kill upward of a hundred in the course of a day, being assisted by relays of dogs, and perhaps a change of guns."

No doubt they were very plentiful in some sections of the country at the time when he wrote, but the gameness of the bird, and its standing as a delicious morsel only served to make the persecutions against it the more persevering. The result is that they are rapidly decreasing in numbers. Woodcock, it must be remembered, raise but one brood of young annually, and rarely more than four in a brood. I have heard of nests being found with five eggs therein, but this is not a frequent occurrence. The young birds begin to look out for themselves within a few hours after their appearance in the world, though they are not able to fly to any extent before three or four weeks. When about six weeks of age, however, although not fully fledged, they can fly with great rapidity, and it requires as much dexterity to kill them then as it does to drop an old bird. There has been a disagreement among ornithologists, I believe, as to the technical name for this bird, some classing it as *scelopax*, and others as *Philohela minor*, but the discussion is not limited to these learned gentlemen. A short time ago a gentleman from this city while on a visit in one of the neighboring counties of Virginia, went out one afternoon for woodcock, having noticed many places where they might be found. Upon inquiry of his farmer friend he was told the birds were plentiful, and a piece of woods was pointed out which it was said they frequented. Further inquiry developed the fact that his granger friend called our common woodpecker "woodcock." Soon, however, our city sportsman found the genuine bird, and bagged several before sundown. Upon his return he displayed the birds with the remark "Here is a true woodcock," but his country friend, with a look of scorn, denied it, declaring "that bird is a seven whistler, and it is no use to call it anything else."

Woodcock, like the snipe, see best at night, but I believe the former are more nocturnal in their habits. They feed principally at night, and are a more gentle bird than the snipe; besides snipe often take long and elevated flights during the day, while woodcock never fly, except at night, unless forced to do so to elude their enemies, and even then fly but a short distance. As before stated, they are found at this season in closely covered swamps, but in this locality it does not inhabit such places exclusively. At some seasons it is no uncommon occurrence to find the bird in corn fields and other cultivated tracts in the vicinity of swampy ground, and it often betakes itself to the woods to rustle among the dry leaves and feed upon the insects and worms found under them. A few remain here during the winter unless the season is unusually severe. Most of them, however, are off for the South as soon as the ground begins to freeze, but return in early spring to breed. Their nest is carefully concealed in a secluded place in low, thick, swampy woods or brakes, on the ground at the foot of a bush or sometimes on a fallen log or decayed stump. It is formed of a few dry leaves or a little grass, just enough to keep the eggs from the cold or moist ground, and in this latitude the eggs generally are laid in March. The female bird is considerably larger than the male, but they fly with such rapidity that it requires great dexterity to kill them. It is well known that they feed principally on earth worms and insects; and it is said that a single bird will swallow more in the course of a night than will equal its own weight, its digestive powers, however, are great accordingly.

Mr. Charles H. Laird is the fortunate winner of the Burnside badge presented to the Columbia Long-Range Rifle Club by Col. J. O. P. Burnside, the President of the Organization. There were four contestants for the prize, participated in by Messrs Chas. H. Laird, James E. Bell, P. J. Lauritzen, Prof. Wm. Harkness and Col. Burnside. The badge is a beautiful piece of workmanship and attracts much attention. It is of gold, with enamelled face representing the target. On the reverse is the inscription

"1877  
BURNSIDE BADGE  
won by  
CHARLES H. LAIRD.

Score, 180 177 184—541.  
Distance, 1050 yards."

The length of the badge is  $1\frac{1}{2}$  inches and width  $\frac{3}{4}$  of an inch. It is surmounted by the monogram of the Club, C. L. R. C., in

gold tastefully interwoven, to which letters the pin is attached. Col. Burnside, the President of the Club, takes a lively interest in the welfare thereof, and the badge was gotten up by him to be contested for, the terms being that one of the contestants must win it three times before it became his personal property. Each contestant had two sighting and forty-five scoring shots over the extraordinary distance of 1,050 yards, and at the first contest Mr. Laird was the winner; at the second Mr. Lauritzen was successful; at the third Mr. Laird again won, and at the fourth he took the prize. The Club meets for practice at the range near Benning's Station on the Baltimore and Potomac R. R. every Friday afternoon, and there are frequently many interested spectators. The organization is now affiliated with the National Rifle Association, having recently received the affiliation papers, and it is in a very flourishing condition.

There is a peculiarity about the black bass fishing in the Potomac near Washington noticed by many intelligent anglers during the past few years, and that is, that but few large fish are taken from the waters near the city. Three or four years ago it was a common thing to catch bass above and in the neighborhood of the Little Falls weighing from two to three pounds. Now small ones are frequently taken, but it is not often that a fish weighing over a pound and a half is caught. Many who have noticed this express the opinion that the large fish ascend the stream to spawn and there remain, as fine ones are frequently taken in the headwaters of the Potomac, Shenandoah and branches of those rivers.

Letters from the Virginia Springs show that but few people are at those popular watering-places this season, but the visitors to the Springs in the neighborhood of the Shenandoah River and its branches are enjoying excellent bass fishing, while at other places the trout streams in the mountains afford rare sport. There is no lack of variety as far as fishing is concerned; all can take a hand, from the small boy of the hotel who successfully dangles the lively worm in a neighboring brook to the experienced angler who casts his fly for trout, or tempts the bass with a fat minnow. The mountains are full of wild turkeys and deer, and an occasional bear is met with. The young turkeys now are in good order and often afford good sport.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining, to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box, 1,294.—Advs. ABBEY & IMBRIE, 48 Maiden Lane.

## The Rifle.

CREEDMOOR, Aug. 18.—The Parker gun match at Creedmoor on Saturday last, gave the long-range men an opportunity for 1,000 yds. practice, the conditions requiring 30 shots at 1,000 yds. Out of a possible 150 the scores ran:

|                      |     |                    |     |
|----------------------|-----|--------------------|-----|
| C E Blydenburgh..... | 133 | H Fisher.....      | 129 |
| F Hyde.....          | 132 | P. F. Millen.....  | 115 |
| T Lamb, Jr.....      | 127 | R Rathbone.....    | 114 |
| I L Allen.....       | 126 | C H Middleton..... | 113 |
| W Gunn.....          | 123 | W M Farrow.....    | 107 |
| J P Waters.....      | 123 | R H Keene.....     | 102 |
| T S Dakin.....       | 121 | J A Hotty.....     | 94  |
| F A Dugro.....       | 120 |                    |     |

Tuesday, Aug. 21.—The first regular practice of the American team and reserve at Creedmoor, on Saturday last, was certainly encouraging, despite an accident to Gen. Dakin's piece, which prevented him from taking his usual high place. The scores stood:

|                      | 800 yds. | 900 yds. | 1,000 yds. | Total. |
|----------------------|----------|----------|------------|--------|
| F Hyde.....          | 74       | 71       | 69         | 214    |
| Isaac L Allen.....   | 68       | 73       | 68         | 209    |
| C E Blydenburgh..... | 63       | 72       | 71         | 206    |
| V Weber.....         | 74       | 70       | 62         | 206    |
| W H Jackson.....     | 72       | 63       | 66         | 201    |
| L L Hepburn.....     | 72       | 69       | 61         | 202    |
| L C Bruce.....       | 69       | 68       | 65         | 202    |
| H S Jewell.....      | 64       | 64       | 62         | 190    |
| T Lamb, Jr.....      | 50       | 65       | 68         | 183    |

The Crescent City Rifle Club team from New Orleans were also down, and for the first time fired over the Creedmoor ranges. These scores are certainly very fair, and fairer than all is Selph's 75 at 800 yards; a very good initial effort indeed. The scores stood:

|                     | 800 yds. | 900 yds. | 1,000 yds. | Total. |
|---------------------|----------|----------|------------|--------|

| Win Arms.....       | 65       | 68       | 65         | 198    |
| H G Kyrich.....     | 64       | 68       | 53         | 185    |
| John M Rosand.....  | 67       | 66       | 50         | 183    |
| E T Marshall.....   | 62       | 64       | 47         | 173    |
| John Glynn, Jr..... | 68       | 47       | 66         | 171    |

THE IRISH AMERICAN RIFLE CLUB have decided to meet the Greenwich, Conn., Irish American Rifle Club in answer to the challenge published in our columns, and on Saturday last the following team was chosen: J. I. C. Clark, J. E. Irwin, N. D. Ward, Corporal Cavanaugh, H. L. Hlover, Ed. Duffy, P. Farrelly, M. M. Malby. Reserves—W. H. Murphy, J. F. McHugh, Sergeant Burns.

The visit to the Connecticut Irishmen will take place Wednesday, Aug. 29—the shooting to be at 200 yds. only.

—For trains to Creedmoor Rifle Range, see time-table in advertising columns. We trust this will answer the numerous inquiries as to how to get to Creedmoor.

THE CRACK CITY SHOTS.—It is a curious fact, observes the *Graphic*, that the crack shots chosen to make up the American rifle team are natives of our larger cities. The Leatherstockings and Deer-slayers of the forest, of marvelous skill in drawing a bead, have disappeared. They are eclipsed by the man of the town, who doubles himself upon the ground like a patient suddenly stiffened in the writhings of cholera, and makes a central shot at 1,000 yards. But the

man of the town has the most practice. He is stimulated by the prospect of a world-wide fame and high stakes. He has a greater variety of targets and practice. There are targets and practices at the butts on the plain, and occasionally, in troubled times, targets and practice on rioters in the metropolitan streets. For the country marksman the wild turkey, deer and bear have nearly disappeared. Nor do rioters fill their places. An occasional tramp, it is true, invites a shot, but does not come often enough to make the practice regular. For such reasons does the country marksman lag behind his compeer of the town.

THE NEW HAVEN RANGE.—Several informal meetings on the question of a reorganization for rifle shooting effort in New Haven have been held. On the evening of the 14th a final meeting was held at the office of Col. Smith, and a full organization effected. The name of the association was finally fixed upon as the "New Haven Rifle Association." Its objects are to provide and maintain a suitable range for military and long-range target practice, and to encourage and promote the interests of this art. The annual fee was fixed at \$3, to be payable in advance. The fee for life membership was fixed at \$10. The regular monthly meetings of the Board of Directors on the first Friday evening of each month. No liquors or intoxicating drinks can be sold or offered as prizes on the grounds at any shoot of the association. The association starts off with some sixty members, having absorbed all the rifle associations in the city. The property of the old New Haven Rifle Association will soon be made over to it formally. The price has already been agreed upon, and new ranges have been constructed in advance. The grounds are east of the Hartford railroad track in the rear of the Schutzen Park. Ranges from 200 yards up to 1,000 yards have been provided, but not furnished yet. They will be furnished with targets and other appurtenances at once, and will have three 200-yards, three 500-yards, one 800, one 900, and one 1,000-yards target. Officers were chosen as follows: President, Col. S. R. Smith; Vice-President, Capt. Frank Tiesing; Recording Secretary, Col. S. J. Fox; Treasurer, Lieutenant Andrew Allen; Directors, Capt. Doerschluck, Captain J. E. Steison, J. M. Marlin and Major W. H. Layne, Jr. O. M. Winchester, James M. Marlin, E. M. Reed and Eli Whitney were chosen honorary members. The range will be formally opened next week.

NEW HAVEN.—On August 8 a match with military rifles was fought on the New Haven range between teams of the Government Foot-Guards and the New Haven Light-Guards, resulting in a victory for the latter, the scores standing:

| New Haven Light-Guards.           |              |              |       |
|-----------------------------------|--------------|--------------|-------|
|                                   | 200 yards.   | 500 yards.   | TOTAL |

| Total.....                        | 115          | 99           | 214   |

Willowbrook Range, Conn.—The regular semi-monthly shoot of the Connecticut Rifle Association, at Willowbrook Range, Berlin, on Saturday, the 11 inst., was a very pleasant and satisfactory one. The long-range champion badge (ten shots each at 800, 900 and 1,000 yards) was won by George T. Judd, of Middletown, this being the second full score at 800, 900 and 1,000 yards he has ever shot. The following were the leading scores in the long-range match:

|                              | 800 yds. | 900 yds. | 1,000 yds. | Total. |
|------------------------------|----------|----------|------------|--------|
| G T Judd, Middletown.....    | 47       | 46       | 38         | 131    |
| P Wessel, New B'n.....       | 44       | 46       | 38         | 128    |
| Orange Judd, Middletown..... | 38       | 43       | 43         | 124    |
| T Parker, New B'n.....       | 43       | 39       | 42         | 122    |
| W H Bins, H'd.....           | 40       | 41       | 41         | 122    |

The mid-range champion badge was won by F. T. Studley of Hartford on a perfect score of ten straight bull's-eyes. The All-Comers trophy, open to any rifle of 40 cal. or under, and any trigger pull, was won by J. L. Woodbridge of Manchester. All the badges must be won three times to become the property of the winner. The mid-range champion badge has been won twice by H. P. King of New Britain. It is proposed to arrange a "ladies' day" on the range.

MASSACHUSETTS—Walnut Hill.—At the third match for the Sharps' mid-range rifle on the 14th inst., but few competitors appeared. The distances were 200, 300 and 500 yards; position standing at each distance; five rounds. Mr. N. W. Arnold had led in the contest on a previous day, and Mr. J. B. Osborn also led in a previous competition. Mr. L. W. Farrar led on this occasion, making 60 out of a possible 75. The following were the leading scores:

|                 | 200 yards. | 300 yards. | 500 yards. | TOTAL |
|-----------------|------------|------------|------------|-------|
| L W Farrar..... | 4 4 5 5-22 | 3 3 4 5-19 | 2 4 5 4-19 | 60    |
| S E R'ng.....   | 4 4 4 4-20 | 4 4 4 4-18 | 4 4 2 5-19 | 57    |
| J H Osborn..... | 4 3 5 3-19 | 4 4 5 4-21 | 4 2 3 5-16 | 56    |

MARYLAND—Baltimore.—The first prize shooting for a Whitney 45-calibre rifle took place at the Patapsco Rifle Range, Baltimore and Ohio Railroad near Baltimore, on Sat., the 18th. The conditions were seven shots each man, 200 yards, open to all comers, any rifle, Creedmoor rules, the member having the highest score in the aggregate of three trials to become the winner. The scores were as follows:

|                       | 200 yards. | 300 yards. | 500 yards. | TOTAL |
|-----------------------|------------|------------|------------|-------|
| P H Hack.....         | 5          | 3 4 4 3 4  | 5-28       |       |

CREEDMOOR, New Orleans.—The last day's shooting of the New Orleans experts of the Crescent City Club was done in

# Sea and River Fishing.

## FISH IN SEASON IN AUGUST.

| FRESH WATER.   | SALT WATER.  |
|--|--|
| Trout, <i>Salmo fontinalis</i> ,<br>Salmon, <i>Salmo salar</i> ,<br>Salmon Trout, <i>Salmo confinis</i> ,<br>Land-locked Salmon, <i>Salmo gairdneri</i> ,<br>Grayling, <i>Thymallus tricolor</i> ,<br>Black Bass, <i>Micropterus salmoides</i> ,<br><i>M. nigricans</i> ,<br>Mascallonge, <i>Esox nubilator</i> ,<br>Pike or Pickerel, <i>Esox lucius</i> ,<br>Yellow Perch, <i>Perca flavescens</i> . | Sea Bass, <i>Sciaenops ocellatus</i> ,<br>Sheepshead, <i>Archostegus probatocephalus</i> ,<br>Striped Bass, <i>Morone chrysops</i> ,<br>White Perch, <i>Morone americana</i> ,<br>Weakfish, <i>Cynoscion regalis</i> ,<br>Bluefish, <i>Pomatomus saltatrix</i> ,<br>Spanish Mackerel, <i>Scomber maculatus</i> ,<br>Cero, <i>Cybinus regalis</i> ,<br>Bonito, <i>Sarda pilchardus</i> ,<br>Kingfish, <i>Menticirrhus nebulosus</i> . |

**FISH IN MARKET.**—Fish of all kinds are very abundant. Spanish mackerel are being caught in large quantities off Long Island. By the last steamer from England, Mr. Blackford received a fine lot of English soles and turbot. Our quotations for the week are as follows:

Striped bass, 18 to 20 cents per pound; smelts, 20 cents; bluefish, 8 to 10 cents; salmon, frozen 25 cents; mackerel, 10 to 35 cents; weakfish, 10 cents; white perch, 15 cents; Spanish mackerel, 15 cents; green turtle, 12 cents; halibut, 15 cents; blackdock, 6 cents; king-fish, 25 cents; codfish, 8 cents; blackfish, 15 cents; herrings, 6 cents; flounders, 8 cents; porgies, 10 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 8 cents; soft clams, 30 to 60 cents per 100; Long Island trout, 50 cents; Canada do., 25 cents; sheepshead, 20 cents; whitefish, 15 cents; hard shell crabs, \$3 per 100; soft crabs, \$1 per dozen; frog's legs 35 cents per pound.

## FISHING UP THE JORDAN.

CHICAGO, Aug. 8, 1877.

EDITOR FOREST AND STREAM:

Ho! for Michigan, the home of the little fishes—where the speckled trout and grayling abound; where the cool springs and dense forest temper the rays of a July sun—whose nights are so cool that sleep is so refreshing, there the tired, wearied brain gladly seeks the rest desired in the city. Thus we soliloquized as we trod the deck of the fine Goodrich steamer at the close of a smoking-hot day in mid July accompanied by the wife and youngsters. We were going north on our fishing trip. Proceeding up the G. R. and I. R. we found several parties on the same errand. We noticed with pleasure the fine fishing tackle many of them had. Here and there we noticed an Orvis rod and reel in the rack overhead; but something pleased us better than this—it was that so many ladies accompanied their husbands, and took so much care of the fine rods that we suspected they intended to cast a fly in these famous waters. Towards evening parties began to drop out. Some went to Traverse City, others at Kalkaska to fish in the Boardman; again another party was dropped at Boyne Falls. The train left us in the midst of a dense forest. One house did duty for a country store, post-office, and station; and general information could be obtained here of the whole country around it. Soon we were at home at the supper table in a comfortable farm house. Our Michigan appetite appeased we began to arrange for fishing. We are not strangers here; fishing four seasons has given us some acquaintance with these hardy settlers; and we can obtain the best information of noted trout streams and creeks; but this year we want to go up the Jordan; so meeting a friend in Petoskey by appointment, we went to Charlevoix, then by steamer to the mouth of the Jordan. Taking along our own boat we found, truly, "Jordan a hard road to travel," but the fishing is splendid, and well repays the many wearying hours of pulling to get up against a sharp current. After getting up about nine miles one can fish all they want. Parties up there caught from thirty to fifty each rod per day, while away up the river it is common to take more than one hundred a day, but the best fishing place is up above Webster's, where fish can be caught by the greenest hand that ever wielded a rod. Besides this beautiful Jordan there are many other creeks and streams that abound in fishes. We caught a nice mess of speckled beauties in a creek not knee deep, yet a rushing, boiling little stream, all riffles and trout holes, the water intensely cold, and trout measuring twelve inches long, with plenty of fight in them. The best place to get to these streams is to take the G. R. & I. R. to Boyne Falls, thence by steamer to Charlevoix; get a guide who furnishes a boat, etc., then for a long pull up stream to the fishing grounds. To those who do not mind a little rough riding and walking, write to Perry Andreas, of the Mancelona House, Antrim County; he can procure you a team that will take you to head of the Jordan. Mr. Andreas is a fisherman, and is always willing to help others by his advice. By writing him early in the season he can procure you a boat if needed, so that you drift down with the current and fish as you go down. Further, I would say go early in the season. Any one going in August will find the trout pretty well educated. June is the best time for trout, though there are times when they will rise to a fly quite eagerly. I found the white miller, coachman and fly very taking flies, but a small piece of salt pork or the ventral fin of a trout will take more fish than any fly in your book. In conclusion, "Any one who has ever fished in this region will want to come again."

NORMAN.

MAINE—Parramene Lake.—I feel it a duty I owe to the large and genial fraternity of gentlemen who "dare trust in Providence and go a-angling," to recommend the many advantages of Spoil Flint's camp. The fishing is excellent in June, but I am told that in September it is superb. The Rangeley and Richardson Lakes are well known, and their claims have been thoroughly advertised. A writer on the subject of these lakes, in a recent number of *Scribner's Magazine*, says, in effect, that west of the Rangeley lakes, in an almost unvisited solitude, is Lake Parramene, to which the adventurous sportsman might penetrate by rowing sixty miles up the Magalloway River. The writer promises such a grand sport, but intimates that three weeks would be necessary to make the trip, and implies that the place is somewhat inaccessible. The writer is partly right, and partly wrong. He does not exaggerate the resources of the place. The wilderness is grand,

the unbroken solitudes are impressive, the scenery that one looks upon as he trends his way up the crooked Magalloway—that winds and turns like a second Meander—is picturesque and varied beyond expression, full of strange lights and shades, delightful surprises, weird glimpses of sunlight weaving its meshes of gold, with the cavernous solitudes of the woods that stretch off in dark and mysterious perspective; and, above all, there is a sense of novelty that is an inspiration. You see the great primeval forests, you feel that these solitudes have never been invaded or spoiled by civilization. As might be expected, the fishing is extraordinary. One lake that we camped upon had never been visited by anglers before last summer, and was a solitary place—the haunt of a royal race of trout. In the clear depths of that lake the trout had never been disturbed save by the plunges of some predatory hawk, and for generations had been permitted to die of old age. It is believed that they are in no respect surpassed by those of Rangeley. They are caught three or four pounds in weight, and not infrequently are those found which kick the beam at five to seven. They may be taken by the artificial fly, and indeed no other lure should be used. The locality is not inaccessible, nor is the journey aught else than delightful in the extreme.

The waters of the Rangeley region flow into Umbagog Lake, and thence westerly into the Androscoggin River. Just below Lake Umbagog, and almost in sight of it, the Androscoggin receives the waters of another tributary from the north, known as the Magalloway River. About sixty miles up the Magalloway is Parramene Lake, and within a short distance of the lake is the log camp of T. S. Flint, the very centre of the best fishing and hunting of the entire region. The camp in question is a well-constructed log-house, and is provided with good beds, an efficient cook, and with all needed comforts. Sportsmen will do well to make this camp their headquarters from which to start out on camping expeditions. Flint is an expert guide, and one that loves nothing so much as good sport. In one eddy, on the Magalloway, not a quarter of a mile from Flint's Camp, a gentleman told me he counted no less than two hundred trout, varying in weight from two to six pounds. T. S. Flint, called "Spoil" for short, has invested considerable money and labor to make his camp comfortable, and is ready to welcome and entertain all who come. He has also cut carries to different localities. His appointment by different parties as supervisor of the forests and the lumbering interests of the region affords him special privileges and prerogatives. The best way of reaching the wilderness is to take the Boston, Concord and Montreal R. R., and go to Lancaster, N. H.; thence you may proceed without delay to Groveton Junction, on the Grand Trunk R. R., thence to North Stratford on the Connecticut River. Here you will find a stage ready to take you twelve miles up the Connecticut River to Colebrook, N. H. This will end the first day's journey from Boston. The next morning early take the stage for Errol Dam on the Androscoggin, where you arrive in time for the steamer that runs up the Androscoggin and Magalloway to Brown's Farm, where you take a conveyance eight miles up the Magalloway to Azis-coo Falls; at this place you will find a nice camp, just finished, where you spend the night. From here to Spoil Flint's camp on Parramene Lake, is about forty-five miles. Taking a guide and boat, you may, by hard work, reach Spoil's in a day, though it is better to take two. Spoil Flint's address is, F. L. Flint, Wentworth's Location, N. H. Letters thus addressed will be forwarded to him promptly.

E. C. S.

Mount Desert, Aug. 20.—Sharks are being caught off Baker's Island. The sport is exciting and furnishes amusement for quite a number of yachtsmen.

MOVEMENTS OF THE FISHING FLEET.—For the past week the number of fishing arrivals at this port has been 18 from the Banks, 34 from Georges, 28 from Shore mackereling trips and one from the Bay St. Lawrence. Total, 81. Receipts, 1,035,000 lbs. codfish and 420,000 lbs. halibut from the Banks, 510,000 lbs. codfish and 14,000 lbs. halibut from Georges, 400 bbls. Shore mackerel, 210 bbls. Bay do.—*Cape Ann Advertiser*, Aug. 17.

Mass.—Boston, Aug. 15.—Tuesday was a most exciting day on the Merrimac. The river was full of horse mackerel, which had come in from the sea to feed upon the menhaden. They were breaking water in every direction. A half dozen boats had each made fast to one of these velocipedes, and such a sight never was witnessed before by the residents. The fish would drive the boats through the water at a much faster rate than any steamer could tow them; and in one case the boat in which Mr. Joel Hodgdon was, ran into the Brown dock, and as quick as lightning ran out again. The sport was witnessed by hundreds of people, and afforded great amusement.

Martha's Vineyard.—Capt. Morgan's yacht the Storm King is now on a fishing cruise with a party of fourteen Baptist clergymen.

CONNECTICUT—Northfield.—The Northfield Knife Company's reservoir, stocked with black bass in 1868, now furnishes some very good fishing. Three bass caught last week aggregated 11 lbs. 2 oz.

Hartford, Aug. 16.—Bass are caught in fair numbers in the river above the toll-bridge. The *Courant* heads a Rangeley Lakes letter "Speckled Whales."

East Hampton, Aug. 16.—Pike, perch and bass are caught in the lake with such success as to afford amusement for fifteen or twenty boats daily.

New Milford.—Isaac Smith recently captured in Lake Waramaug a black bass weighing seven pounds, the largest ever taken in those waters.

Eldred, N. Y., Aug. 20.—We are here 2,300 feet above the sea level, in the centre of a fine game country. The streams are full of trout. Partridges will be very abundant next month. There were no fires here in the woods last spring to destroy them. From the house we frequently see deer in the ry fields, and as they are most abundant there is promise of excellent shooting in September. Eldred is six miles from Shohola on the Erie R. R. Bradley gives sportsmen good accommodation.

A. W. C.

Sodus Bay, N. Y., Aug. 20.—Pickerel fishermen are taking advantage of the absence of the small fish which usually furnish food for this voracious feeder, and are consequently making some splendid catches. A party of four with two boats, in less than two days' fishing last week, caught more than one hundred fish.

Hornellsville, N. Y., Aug. 19.—The party that left here a few days since for Potter County, Pa., have returned, bringing 600 trout as the result of their camp out.

JOHN.

Capt. P. C. Wilbur, E. R. Wilbur and W. H. Shaw, of Sayville, L. I., caught 43 bluefish in 24 hours, on Saturday, Aug. 18th, in Great South Bay, near Point of Flats.

Bro TURK.—A loggerhead turtle, weighing 300 pounds, the largest one ever known to have been caught so far north, was taken in the Fire Island Inlet last week.

NEW JERSEY—Kinney's Ashley House, Barnegat Inlet, Aug. 16.—We are taking bluefish by the boat load. They run from five to twelve pounds. For the past three days acres of them have been off and on the Bar. Sheepshead are biting better.

B.

Aug. 19—8 P. M.—Five yachts just landed with from 800 to 1,200 pounds of bluefish each, which run from 9 to 15 pounds. The best fishing for two years; not less than 6,000 pounds taken to-day.

PENNSYLVANIA—Clearfield, Aug. 17.—Black bass fishing excellent.

New Castle, Pa., Aug. 18.—Joe Johnston captured forty-nine bass in the Mahoning one day last week. The aggregate weight was fifty-two pounds.

Bristol, Pa., Aug. 20.—Black bass are caught in the canal above the bridge. They are of good size and bite freely.

Angling in the upper waters of the Chesapeake has been unusually poor this summer owing to the frequent rains. In the Delaware, white perch are more numerous than usual, and some large catches have been made with bowlines.

IOWA—Des Moines.—On the 9th of August a party of Polk County Anglers started on a piscatorial mission to Spirit Lake, in Northern Iowa, to prey upon the innocent settlers along the line like "ye anglers of old." They propose to remain some three weeks, unless the enraged populace of that country rise in their might and drive them out for depopulating the lake. Game fish in this part of the country are scarce, the only ones coming particularly under that head being pickerel, white eyed pike and salmon, and they are scarce. True, we have some cat fish and suckers, but there is no sport in waiting all day to catch a little half pound cat.

WISCONSIN—Ashland, Aug. 11.—Mayor Heath, of Chicago, has been on a grand trouting expedition on the Sioux and Sand rivers. Capt. W. W. Rich and Guy Campbell caught 127 fine trout in one day's fishing at Fish Creek last week.

MICHIGAN—Cheboygan, Aug. 10.—A young lady—Miss Crocker—while fishing in Mullett's Lake a few days since, hooked and landed a maskelonge, three feet eleven and one-half inches long, weighing thirty-four pounds. It was the largest fish ever caught in these waters.

The locust promises to become an important article of commerce. France annually spends immense sums of money in the purchase of cod roe as bait for the sardine fisheries. The importation of roe from Norway is more than 40,000 barrels annually. The locust proves an excellent substitute for the roe, and it is probable that an extensive traffic in the article will spring up between France and Algeria.

When ought mariners to have fruit at sea? When they stem the currents.

QUEER CAPTURE OF A PIKE.—A correspondent of an English paper vouches for the following fishing extraordinary:

A stick was thrown into the water for my dog (a fox terrier) to fetch out. Seeing the dog in difficulties with his stick (a straight cane), I went down to the water's edge and, on his nearing the bank, saw a fish struggling on the stick. I helped the dog out, and found on the stick a pike weighing two pounds. The stick had gone into his mouth, and projected several inches through its gills. It is presumed that the fish rose at the brass ferrule of the cane, and that the dog in its struggle forced the stick through its gills.

## Tiffany & Co., Silversmiths, Jewelers, and Im

porters, have always a large stock of silver

articles for prizes for shooting, yachting, racing

## LYMAN'S

## PATENT BOW-FACING ROWING GEAR.

This invention enables an Oarsman to see where he is going. He sits with his face to the bow. Every rower knows how awkward it is when pulling stroke, or as bow-ear in a crew, to have to turn and watch the course. By using this arrangement the rower is brought into his proper position, and he can row as he would drive. There is NO LOSS OF POWER. Send for circular, directions and opinions of the press to the Patentee,

**WILLIAM LYMAN, Middlefield, Conn.**

OFFICE IN NEW YORK, 32 CORTLANDT STREET.

## New Advertisements.

## COMPLETE OUTFITS

## EMPIRE STATE KENNEL, BROOKLYN, L. I.

BELE-RUFUS. We are now looking orders for blood-red Irish setter puppies, whelped Aug. 15, 1877, out of our red Irish setter bitch Belle (Prize winner, Sec. 2, at Mineola, L. I., and Centennial medal and diploma), by Arnold Burgess' champion Rufus.

These puppies (eight dogs and three bitches) are the handsomest we have ever seen; they are all red, with no white, and, in appearance, like their noble sire. Rufus is one of the best bred and hand-somest dogs in the country, and winner of more show prizes than any other Irish dog, having gained three abroad and six in the U. S., including the Irish championship at New York (beating Elcho) and stock dog cup. Rufus is the sire of the following noted prize winners, all of one litter: Rufus II., Centennial Irish champion; Rory O'More, first New York (beating the get of Elcho and Plunket); Elcho Fly, first Centennial and second New York; Kelpie, second Centennial, and Fanchion first Kaeska City. Belle is very handsome, being the fairest feathered bitch in America. She is thoroughly broken on all kinds of game. For price, etc., address FISHER & BUCKERFON, 119 Flatbush Avenue, Brooklyn, L. I. Aug 23 4t

**SEA CLIFF HOUSE, SEA CLIFF, L. I., OPENS** for the season 1917, on May 1 at rates to suit the times. Special arrangements for families, may17-1t E. RICKARDS.

**Sportsmen's Routes.**  
**NORTHERN RAILWAY OF CANADA**  
AND  
**COLLINGWOOD LINE.**  
Only first-class route to the beautiful inland lakes of CANADA AND LAKE SUPERIOR.

The Fine UPPER CABIN STEAMERS of this line leave Collingwood EVERY TUESDAY and FRIDAY, at 6 P. M., on arrival of steamboat express leaving Toronto at 1 P. M.

The Great North Shore Lake Superior Route and ONLY LINE passing through the magnificent GREAT NORTH CHANNEL.

Lake Couchiching, and the  
Lakes of Muskoka.

Are the coolest and most delightful summer watering places in Northern Canada. Tourists proceeding down the St. Lawrence can make a pleasant detour from Toronto to Couchiching in five hours of express train, with Drawing-room Coaches, thus visiting the most charming of the chain of Lakes.

**EXCURSION TICKETS**  
at greatly reduced rates during months of July, August and September, may be had from

COOK, SON & JENKINS,  
261 Broadway, New York; and  
AT CENTRAL VERMONT RAILWAY OFFICE,  
322 Washington street, Boston.

BARLOW CUMBERLAND,  
GENERAL AGENT,  
jfs 2m 35 Yonge street, Toronto.

**TROUT FISHING!**  
**The Wisconsin Central Railroad**  
THROUGH TO  
**LAKE SUPERIOR.**  
EXCURSION TICKETS from Chicago to Ashland and return for \$20 are sold at 65 Clark street, or the C. M. & St. Paul, Madison Street Depot, Chicago; also at low rates from Milwaukee. Dogs, guns and camp equipage taken free.

The points of attraction to sportsmen on this "Forest and Stream" route are Menasha (Daisy Island) for bass fishing; Butte Creek and Lake for muscalonge; the many branches and lakes of the Flambeau and Chippewa which teem with bass, pike and pickerel, never till this season fished by sportsmen. Between Silver Creek and Ashland all are trout streams, and many others can be easily reached along the shore from Ashland or Bayfield, while rock fishing and trolling in the Bay affords excellent sport.

The new hotel at Ashland, the "Chequamegon," will be opened in July. Meantime there is accommodation at the smaller houses.

Steamers from Ashland to all Lake Ports.

Dec 21 1y

**THE "FISHING LINE."**  
**Brook Trout, Grayling and Black Bass Fisheries**  
OF NORTHERN MICHIGAN, VIA  
**Grand Rapids and Indiana Railroad.**  
(MacKinnaw, Grand Rapids & Cincinnati Short Line.)  
Sportsmen who have cast a fly or trolled a spoon in the waters of the Gulf Stream enjoys an equable temperature of about 70 deg.

The fish named above, as also Muscalonge, Pike and Pickerel, abound.

The other streams east of the Rocky Mountains is the famous American Grayling found in such numbers.

Brook Trout Season opens May 1st.

Grayling season opens June 1st.

The sportsman can really send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and Lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1st Round Trip Excursion Tickets sold to points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, MacKinnaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide, containing full information as to Hotels, Boats, Guns, &c., and accurate maps of the Fishing Grounds, send to FOREST AND STREAM office, or address

## Gunpowder.

# ORIENTAL POWDER MILLS

MANUFACTURERS OF ALL KINDS OF  
**GUNPOWDER**

Office—13 BROAD STREET, BOSTON.

BRANDS—DIAMOND GRAIN.  
FALCON DUCKING.  
WILD FOWL SHOOTING.  
WESTERN SPORTING.  
(Oriental Rifle.)

The "Oriental" powder is equal to any made; no expense is spared to make the best.

## BRANCH OFFICES.

J. G. Munro, Agent, 10 Exchange St., Buffalo, N. Y.  
Cobb & Wheeler, Agents, 9 State St., Chicago, Ill.  
C. J. Chapin, Agent, 215 Locust St., St. Louis, Mo.  
Agencies in the principal cities in the United States.

## Lafin &amp; Rand Powder Co.

No. 26 MURRAY ST., N. Y.

## Sole Proprietors and Manufacturers of Orange Lightning Powder.

No. 1 to 7, strongest and cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

## Orange Ducking Powder,

For water-fowl, strongest and clean. No. 1 to 5 in metal kegs, 6½ lbs. each, and canisters of 1 and 5 lbs. each.

## Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, PFG and FFFG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6½ lbs., and in canisters of 1 lb. and ½ lb. All of the above give high velocities and less residuum than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

BLASTING POWDER and ELECTRICAL BLASTING APPARATUS. MILITARY POWDER of all kinds on hand and made to order.  
Safety Fuse, Frictional and Platinum Fuses.

Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

## THE HAZARD POWDER CO. MANUFACTURERS OF GUNPOWDER.

## Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

## Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

## Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

## Hazard's "Kentucky Rifle."

FFFG, PFG, and "Sea Shooting" FG, in kegs of 25, 12½ and 6½ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFFG and PFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

88 WALL STREET, NEW YORK.

## THE New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD  
For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequalled for rapid firing, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address:

CARL DITTMAR, NEPONSET, MASS.

New York, July 10, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Please say, for the information of some of my friends who may be misled by current statements, that I am still on the same powder for all out-door shooting, which I have used for several years past, never having risked the use of the nitrated powders except when shooting in a confined space indoors, when the smoke from any regular powder would produce a small rather offensive to some people, and cause somewhat greater obstruction to vision.

CAPT. A. H. BOGARDUS,  
Champion Wing Shot of the World.

## Gunpowder.

## Warren Powder Mills,

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

SPORTING BRANDS—Eureka, Continental, "Border Rifle," Snap-Shot, and Warren Sporting Cannon and Musket, U. S. Standard. Delightful orchestral concerts. Feeding the animals and fishes and other entertainments.  
Coney Island Aquarium now open for the summer.

Highest Honors  
**CENTENNIAL WORLD'S AIR, 1876:**  
**SHONINGER ORGANS.**

PRONOUNCED UNANIMOUSLY AS THE  
**Best Instruments.**

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The **SHONINGER ORGAN CO.'S** exhibit as the best instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." **THE ONLY ORGANS AWARDED THIS RANK.**

This Medal and Award was granted after the most severe competition of the best makers, before one of the most competent juries ever assembled.  
New styles and prices just issued, which are in accordance with our rule, the **BEST ORGANS** for the least money.

We are prepared to appoint a few new Agents. Illustrated Catalogues mailed, postpaid, upon application to  
**B. SHONINGER ORGAN CO.,**

TRIPLEX.

marked the PREMIER QUALITY

[Extract from FOREST AND STREAM, New York, December 26, 1876. Contributed by one of the Judges of Awards of Guns at the Centennial:]

"This action (The Triples Lever Grip) combines in the highest degree strength and simplicity, and must rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on every gun. Costs about \$10 extra. Choke-bores, medium or full. Our guns to be had of the principal dealers in the trade only.

PREMIER GUN WORKS, Birmingham, England.

## Paper and Metallic Shells

FOR

## Breech-Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

THE STURTEVANT SHELLS are the easiest reloaded. Do not have to unscrew the head nor use anawl to remove the exploded caps. THE PATENT MOVABLE ANVILS, made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with Hobbs' patent waterproof primers, never raise fire, and are highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great outlay for improved materials, and machinery made expressly for the purpose, we can now warrant our BROWN PAPER SHELLS equal to any imported. They are sure fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for the U. M. C. Co.'s Shells. Not sold at retail by the manufacturers.

## "St. Louis Conical Base Paper Shell."

Having made important improvements in our Shell, we can safely recommend them as equal, if not superior, in quality to any Paper Shell manufactured in this country or in Europe.

Among the advantages claimed for these Shells, are: A saving of 25 per cent. in the use of powder; also the great decrease in recoil. The sizes made are No. 10—3/4, 12, 14, and 3 inches; No. 12—2 1/2, 2 3/4, and 2 7/8 inches. Longer and shorter.

Shells will be made at extra cost. They are not mailable. Sample, 100, sent by express on receipt of \$1.75 for No. 12; \$1.20 for No. 10.

Factory and office, No. 2,239 De Kalb street, St. Louis, Mo.

St. Louis Patent Shell Manufacturing Company.

## Capt. Bogardus' Patent Glass Ball Trap and Rough Balls.

These Traps and Balls patented by Bogardus and used by him many thousand times, proves them to be just what is wanted by all

SPORTSMEN'S CLUBS AND AMATEURS.

—THE PATENT ROUGH BALL.—The only Ball that will break sure when hit by shot. Use none but the best. Every ball marked. Patented April 10, 1877; Traps, March 13, 1877.

Geo. E. Hart & Co.,

NEWARK, N. J.

TRADE SUPPLIED.

HUBER & MERWIN'S CHAMPION BALL TRAP.

We call the attention of the fraternity to the above trap, claiming to be the *ma plus ultra*. It combines compactness with durability, and is arranged, by a swivel on the bed-plate, to throw a ball in any direction or at any elevation unknown to the shooter, a screen preventing his seeing the direction in which the trap is set.

The spring, as the cut will show, is made of a steel rod or wire, bent spirally at the point of attachment, thus receiving the concussion its entire length, and preventing breakage.

FOR SALE BY

BARTON & CO., Sole Agents,

337 BROADWAY, NEW YORK.

This certifies that I have used every trap in market, and find the CHAMPION GLASS BALL TRAP, for durability and perfection of its operation, superior to them all, and take pleasure in recommending the "Champion" to sporting clubs and my friends. (Signed) Aug 9 ly

## ROD AND GUN

THE AMERICAN SPORTSMAN'S JOURNAL.

For ms. Four Dollars a Year. }  
Ten Cents a Copy.

NEW YORK, THURSDAY, AUGUST 30, 1877.

{ Volume 9.—No. 4.  
{ No. 111 Fulton St., N. Y.

### FISHERS OF MEN.

Down the calm river they leisurely floated;  
There, in a nook that was shady and cool,  
They brought out their lines, and their hooks were all coated  
With bait, well adapted the fishes to fool.

Mabel was with them, and Lizzie and Laura,  
Maidens light-hearted, and merry and fair,  
Each bestowed smiles on her favorite adorer,  
Destined, perchance, to fall into her snare.

Idly they played with their lines in the river;  
Little they cared though no fish should be caught;  
Fondly each hoped that the fates would deliver  
Into her keeping the lover she sought.

Lightly they talked upon themes with which Cupid  
Had lavishly filled both their hearts and their brains,  
And laughingly said that the men were all stupid,  
The while they were artly weaving their chains.

The day passed away and the fishing was ended;  
Pleased with themselves the fair innocents looked;  
They gazed on their victims, and each comprehended  
The fish she had angled so long for was hooked.

Then back to the town the young men rowed lightly,  
Their baskets all empty—that fishing was tame—  
While on each other the maidens smiled brightly;  
The fishers of men had won at their game.

For Forest and Stream and Rod and Gun.

### The Backwoods Canvasser.

His name was Jim.

He had another name—supplementary, as it were, to this "front" name—but it came in use so rarely that even his old acquaintances had nearly forgotten it. Let it remain unknown, as Jim sometimes reads the magazines and would visit dire vengeance upon the writer should he see this truthful chronicle of his deeds. Let it not be reasoned from the redundancy of Jims in narratives of personal adventure, that this one, like the majority of them, is fictitious.

"A truer tale has ne'er been told,  
And his name was Jim, and is—"

Under the palms of Florida's southern shore, stretched beneath the waving, rustling palmettos, carrying an eagle-headed whistle, carved from the ivory tusk of an alligator, lay my hero when first I met him. I had had, as boatman and guide, old Captain Congrar, a salt from the North, who had lost his savor by living a score of years in the South. A rare specimen of the misplaced Yankee was the captain, possessing all the delft ways of the nautical Cape Coder, and the laziness and unthrift of the Florida "Cracker."

Rum did it—rum and poverty; for in this case they are not synonymous terms.

The captain was a queer nut, alternately pleasant and again strangely sulky. In one of his odd freaks of lunacy he had, left me upon the sandy shore of a secluded island, far down the coast, thirty miles from the nearest habitation. Rather, let me say, he had left my effects. I was in the mangroves, half a mile from the boat, following the trail of a wild turkey, while he, perfidious guide, was calmly depositing my goods upon the beach. A pile of camp equipage beneath my eye and a white sail far away, as I emerged from the swamp brought me up, to use the captain's favorite expression, "all stan'in." To shout was useless. The captain's back was toward me, and his face determinedly set toward his humble cabin and its adjacent grocery, ninety miles to the northward. A scrawl traced in the white sand read:

"Too much pisen for my stumik."  
Alas! and had it come to this!

Rare birds and strange beasts were the object's sought by me in this nondescript land of the transition, and I had, for the preservation of their furry and feathery coverings, a large package of arsenic. Long usage had accustomed me to its presence at our frugal meals, but not so the captain. In vain I cited learned authority in favor of its use; in vain I reasoned and labored with him to the effect that, should he accidentally swallow a poisonous dose, a mouthful of mustard and water or an opportune application of the stomach pump would instantly relieve him. He saw that I was wedded to my arsenic, and had taken the method narrated to rid himself of the "pisen" and myself at once.

Night was not far distant, and it was necessary to prepare for it, leaving to the morrow the question of escape. I found,

Selected.

upon hasty inspection, that my guide had left me all my own, with exception of a rifle and cartridges, sufficient to compensate him for his wages in case of my defection. There were provisions enough for a fortnight, and game was plentiful in the jungle behind the beach in shape of birds, so that on the score of subsistence I knew no fear, and proceeded to pitch my little tent serenely beneath a glossy-leaved India rubber. My guide, with a thoughtful kindness that must have hurt him, had left the cold remains of the morning's meal—venison, fish and flapjacks—and, after a cup of hot coffee, I threw some dry wood on the fire and went to sleep. I had been too long in Florida woods to trouble my brain with visions of wild prowlers of the night that never appear, and snakes and scorpions that never bite, and my slumber was sound and sweet.

The duties of the opening day, simple and primitive, occupied but little of the morning, and ere the sun had dried a drop of dew from the leaves, I was beyond the jungle fringing the snowy beach hunting the sombre oak hummock for my turkeys of the day before. The excitement attending the working up of the trail, the surprise, the capture, and the subsequent shooting of the stragglers, so occupied me that it was well toward noon when I turned toward my deserted camp. Staggering beneath my load of noble birds, breaking through the spider-legged mangroves, disturbing countless hundreds of quaint fiddler crabs and enormous spiders; brushing aside the impeding vines, I burst upon my camp, no longer deserted, for there lay—Jim!

It was our first meeting.

A little sloop-rigged boat was drawn up on the sand. I manifested no surprise. He looked not up. Thrusting the half finished whistle into his pocket, he arose and said, looking out upon the water, "Want to see me catch that 'gator?"; I threw down my turkeys and looked out over the water. Just outside the break of the surf, on the beach, was the head of an alligator—listless, seemingly lifeless, asleep, drifting on the glassy water with half closed eyes. To inexperienced eyes that head would seem a black knot of wood borne by the waves; to my eyes it appeared the head of a nine-foot alligator. Without awaiting reply, Jim waded in—deeper and deeper; the water reached his waist and dashed lazily against his breast as he neared the sleeping *saurian*. The heat of a semi-tropical sun had lulled his senses to repose, else Jim could not have approached so closely unseen and unnoticed. Cautiously dipping his hand in the water, and bending over so that his face was squarely reflected in the watery mirror, Jim suddenly closed upon the thin, serrated tail, and then braced himself quickly back to meet the expected shock. It came. Concentrating his dormant energies in a single rush, the 'gator leaped forward with a terrific splashing of his paws; but he strove in vain against the strength of my hero, for, though he could drag him, he could not throw him, as he hung to the tail with both hands. The gleam of quiet satisfaction that shot from his eyes as his hand clasped the 'gator's tail was gone, and in his face there was a fixed determination born of the struggle—the first recorded of the strength of man pitted against that of alligator. But, as might have been expected, the contest could not last long. I do not think that Jim meant to capture the reptile, only to impress me favorably with his prowess by an act of bravado. Finding he could not escape, the alligator paused a few seconds, quivering with rage, his sullen eye emitting lurid flame, every scale on his mailed back rigid with anger. Only a moment of time—a second or two, perhaps, when, with a muttered, guttural bellow, like that of a half-strangled bull, he threw himself out of the water, swinging around till his horny snout nearly touched his tail and the horrid jaws clashed in Jim's face.

That spectacle will last while memory holds. The black bulk, but a few minutes since inert and apparently lifeless, poised in air, lithe and terribly vigorous, the water dripping from its mailed form and streaming from its armed jaws.

It is not strange that Jim loosed his hold, even if the sudden jerk had not forced him, with that cavernous mouth, white with bared and glistening fangs, so near his face. He fell backward into the water, and the alligator, instead of devouring him, as it had good cause to do, darted beneath him with the rapidity of light. A few rods away the black head reappeared, and the evil eye glittering coldly beneath the projecting dome of the skull, watched its late antagonist as he floundered ashore. A muttered curse or two on Jim's part

and a whirlpool of foam on the alligator's, as a ball from my rifle dashed the light from his eyes forever, ended the comedy that had threatened to be a tragedy. Wringing the water from his shirt and ragged breeches, Jim spread himself and them upon the sand to dry.

It transpired in the course of the day, that the captain had met Jim, told him of my circumstances, and had hinted in a moment of remorse, that it would be as well for me if I were off the island, as a storm was threatening and the rising water would suddenly cover my camping place—too rapidly for escape.

This actually happened a few days later, but we were safely clear of the island then.

Jim was garrulous, and delighted to relate his many adventures, mainly with panther and alligator. "Why, this wasn't nothing to what I did once up in the Banana River, as any body on the river can tell you. You see there's a big 'gator hole up there, where's jest the biggest 'gator that ever you did see. Old Cap'n Congrar was with me and stumped me to dive down and yank him out. Well, I wa'n't to be beat on that game, and I jest stripped and went for him. There was jest the tip of his tail a-stickin' out, and I knew from its clumsy look it belonged to a big one and I should have a tussle. Well, you see, I got hold and hauled and braced my feet against the bank, but I couldn't start him. Then I had to come up to breathe, as the water was more'n fifteen feet deep, and then down I went again and took another pull at it. I swear! I believe that tail was rooted in the bank, and I had tried three times and was jest givin' it up when the darned thing began to move. It didn't sort of yield gradually like, but seemed to come out of its own accord, and as though it wa'n't in any hurry about it either. Well, I found 'twa'n't no use pulling, and I jest watched it backin' out till it got to the fore-shoulders, and much as fifteen feet was in sight and more a-comin', and the shoulders was broad as a bear's, and then I scooted. It wa'n't none too quick, I tell you; and that thar 'gator he streaked her for the boat, and took a piece out of the gunnel of one side jest as I was climbin' in 'tother. The cap'n he was so scart his hair stood right up, and he didn't have sense enough to paddle ashore, but sat there saying, 'We're gone coons, sartin! we're gone coons!' Well, the 'gator left us and put for his hole, with the piece of our boat in his mouth, and we could hear him a-clawin' of it and a-growlin' over it. He was a twenty-footer, sure as preachin'."

This account was substantially verified at a later date by an old inhabitant of the coast, who added that Jim was not afraid of the devil himself.

A few weeks later we were at an inlet on the coast, fishing for sea bass, which were unusually plentiful, rippling the water in their eagerness to take our hooks. I was engaged in catching them, throwing my line into the surf and then running up the beach with the powerful fish, while Jim had gone to the hail of the captain of a small schooner anchored inside the bar. Soon he appeared, and running his eye over the long row of silver-sided fish, said I had caught enough and must go with him to aid in recovering the captain's anchor. Of course I obeyed, and we moored our boat as near as possible above the place where the anchor was lost. The fast ebbing tide ran rapidly by us, dashing against our boat and singing against our moorings. On either side a multitude of sharks disturbed the water, their triangular fins projecting above the surface and streaking it with foam. Jim attached a line to his naked body, telling me to haul in rapidly when signaled, and dove. Anxiously we waited for his reappearance, and when he came up safely and reported the anchor caught beneath a mangrove root, we urged him not to go down again; but, with a glance at the increasing number of fins, he gave me directions about the line and to keep up a continual splashing, and then disappeared. Up again; a rest of a minute, clinging to the side of the boat, and again beneath the angry waters. The fourth time he was successful, and as I helped him into the boat, exhausted and breathless, he whispered faintly, "Made that V easy, didn't I?"

This is but one of his mad pranks.

I have seen him snatch a bird from the jaws of an alligator and then add a rap over the nose that greatly hastened the departure of the astonished reptile, thus bearded in his own den. A similar instance occurred while he was acting as guide to a staid college professor the next year, as the professor aforesaid delights to narrate. So much instruction in wood lore, the

haunts of bird and beast, the methods employed in their capture did I obtain from Jim that it was with deep regret that I parted from him, and even overstayed my allotted time far into early summer. We parted, with the naive confession from him that I was "the best Yankee he ever ran across."

The New Year of another season saw my boat scudding across the wide northern head of the immense Indian lagoon, headed for the veritable grocery, near which lived the year before, the captain and Jim. Verily! leaning over the self-same counter at which I had left him, in the same state of semi-inebriation in which he had bade me farewell, ragged, shoeless and hatless, was Jim. His welcome was bolsterous, as in me he saw the source of former emolument and perhaps of future gain, and he at once gave me the freedom of Salt Point, and added in a confidential tone that his high office of constable would secure for me unlimited and gratuitous ministrations from the denizens of Salt Point. Then, with the air of one who has conferred inestimable favors, he walked unsteadily down the shabby wharf to my boat, and instituted a systematic search of my luggage, against which I knew it would be useless to remonstrate. The several articles of value that he laid aside I left, relying upon a more favorable season for their restoration.

At last a smile of peculiar satisfaction overspread his features. He held in his hand some loose copies of the *FOREST AND STREAM*, and as he ran his eye adown their columns and noted the attractive headings of the different articles, his soul warmed within him with a fraternal feeling for the paper that chronicled deeds congenial to his nature.

"This paper," said he, "is jes' the paper I want. I'll take what few you've got here, an' when you get home you can sen' me the rest."

I acquiesced, of course.

"Now," continued he, "I'll jes' go up an' indooce the people of Salt Pint to s'cribe for this're paper, an' if you'll for'ard the s'criptions to the boss of t'establishment I'll give you half."

At this I ventured to remonstrate. Surely the people of Salt Point would not care for the paper, living, as they did, so near starvation point, with no time or inclination for reading. Half of them could not read and none of them could afford it.

"Look a-here, I guess I can take care of my own business. Them folks up there are my frien's an' will do as I say."

Having thus delivered himself, he walked up the wharf with the papers under his arm, refreshed himself and a small bottle at the grocery, unbitched a scrubby marsh pony from a denuded palmetto, mounted, and was about to dash away when I restrained him. I appealed to him in vain; he would not listen. The whisky had produced in him that dogged indifference that usually preceded an outbreak, and he only muttered, gazing ahead with stony eyes that seemed to see nothing but food for mischief:

"You see, I'm constable; got my commission from the Gov'ner, an' if I can't do as I durn please, who can? There's old Feester—dog gone his skin!—owes me seven dollars. Le' go!" as I laid a hand on the bridle rein. "Le' go!" and with a dash of spurs into his wiry pony and a brandishing of gun and papers he dashed down the trail toward a weakened old man. I caught up with him in time to hear: "It's jes' that or th' jug. I'll give five minutes to say. Third time's death!"

I was alarmed. It was evident that Jim was crazy drunk, or fast getting so, and I interceded for the aged cracker. But this individual tipped me a wink, assured me that it was "only one of Jim's cuttin' ups," and then, turning to him, begged him for his family's sake to have mercy.

"No! it's pay up now, or march; an' if ye don't keep up with the pony I'll plug ye with a bullet. But I'll tell you what I'll do—s'cribe for this paper an' I'll let ye off this time."

"What kin' of a paper is it?"

"Never ye mind; jes' s'cribe or travel."

"Well, how much mought it be?"

"Thirty-five dollars, an' dog gone cheap for sure!"

"That ther is cheap, I allow, an' ye might put me down."

"That's all I wants!" shouted Jim. "My frien' here collects, an' it'll go hard if ye don't pay up." And he rushed away, leaving me petrified with astonishment and overwhelmed with the responsibility of my office as collector. His "Whoop-la!" grew fainter and fainter, and the jingle of his spurs were no longer heard.

"That ther feller is a tougher, an' if he'd let licker alone he might be as 'spectable's I am; but he won't, nohow. He's jest a-goin' to raise dust, an' I must go down an' look out for the ole 'oman an' chil'n. Have ye got a drop about ye, cap'n?"

We reached the "settlement" a long time behind Jim, and discovered consternation dire in every house. Like an avalanche he had descended upon them, and had proclaimed with threatenings of imprisonment and even death, that they must take his paper. Could the editor of that valued paper have seen the enthusiasm manifested both by canvasser and subscribers, doubtless he would have thought the printers' millennium had arrived. It is needless to add that every man, woman and child was a subscriber. His success only stimulated him to further effort, and just as we reached him he was entering the pine woods trail to the steamer at Salt Lake. He drew up his panting pony, quivering and foam-splashed, shook the roll of soiled papers, that had not yet left his hand, at me threateningly, and cautioned me to visit every family in

Salt Point and collect the money—for he had got their names. I afterward learned that he reached the steamer or the shore of the lake, waded out to the boat and presented himself, dragged and forlorn, at the door of the ladies' cabin. When interrogated as to his business there, he muttered vaguely, "SPECIAL CORRESPONDENT *FOREST AND STREAM*," and fell asleep.

The people of Salt Point did not regard me favorably, and I judged it not expedient to collect their subscriptions, but put the greatest imaginable distance between myself and them in the shortest possible time.

FRED BEVERLY.

*For Forest and Stream and Rod and Gun.*

## RED SNAPPER FISHING IN THE GULF OF MEXICO.

IN this part of the country the fish known as red snappers are decidedly a favorite. In the markets of New Orleans, Mobile, Galveston, Pensacola and Savannah they are abundant; and from these points throughout the year, and especially in the winter, they are shipped upon ice to many towns and cities far to the north. There are but few varieties which are bought in preference to them. They are much sought after by the fishermen in the Gulf of Mexico, and often constitute nearly the entire cargo which the snacks bring into port. They are a gentle fish, and a diver may go down into the well of the vessel, where they are, without creating the slightest commotion among them. Indeed, they will swim leisurely all around him, come up to inspect his face, and allow themselves to be moved gently aside with the hand. Should they be hungry, it were well if the diver kept a sharp lookout to see that they did not take a nip at his nose. They are measurably hardy, and when not badly bruised or wounded, when put into the well, and the well be not too much crowded, they will all reach port as lively and fresh as though in the open sea.

It is doubtful if one in ten of your readers knows how these beautiful and delicious fish are captured. There are doubtless thousands, even, who have no conception of the construction of a smack, or how fishing for "snappers" is carried on, and to whom a brief description of the matter would be of interest.

Cruising along the coast and among the islands of the Gulf of Mexico, with a pleasure party of a dozen, two of us temporarily transferred ourselves, with a change or two of linen, from our little schooner to a large and neat two-masted fishing vessel, which, by agreement made at Mobile, had overhauled us at Sand Island about the 10th of July. We sailed for Pensacola harbor, which we reached that night about ten o'clock, and anchored off Fort Pickens. The next two days were industriously spent in seining for bait, but with such poor success that at the end of that time only about one-fifth of a barrel had been taken and salted down. The schools of fish, and especially the lady-fish, which were those desired, seemed to shun the shore and keep out in the deep water, so that a cast was almost impossible. On the third day, however, the captain ordered the anchor up and sails set. This being done we passed out of the harbor and headed to the southeast, from which sailors and passengers inferred that we were off for the banks, notwithstanding our small supply of bait. Our captain was a reticent fellow—consulted no one, kept his own counsel, and you either had to guess at what he intended doing, or wait for your knowledge of his movements until he acted. But he was evidently a good sailor, thoroughly posted in all the details of his business, and his passengers had abundant evidence of his kindness and excellence as a gentleman.

It was the intention, as we learned afterward, to take us to banks about fifty miles to the east of Pensacola, and some twenty miles off-shore—a spot known only to a few fishermen; but in making the run we fell in with two other fishermen, returning with cargoes from banks nearer at hand. They had gone out only the day before us, and had filled up so readily that our captain was induced to try the banks upon which they had fished. So turning his course southward, when some twenty miles east of Pensacola we sailed on till the tall pines upon the mainland fell beneath the waves behind us, when soundings were ordered. A hook baited with a piece of fish being attached to the line, about two or three feet above the lead, the lead is sent whizzing ahead of the vessel, and as the nine-pound piece of metal settles to the bottom, the man sings out, "Fourteen fathoms, seventeen, fifteen, sixteen," and so on, showing the ridges and uneven bottom sought, until the call "Eighteen fathoms large," is sung out, when the vessel is luffed up, allowed to drift, and the lead carefully moved about until the banks are passed over—and no bite. We put about and ran across them in another place, and still again and again, until uneasiness began to depict itself on the countenances of the two passengers, when at last the captain ordered soap upon the lead. This brings up sand and red coral. "They ought to be here," says the captain. Another turn, and while the man with the lead is gently raising and letting it fall in eighteen fathoms of water, he gives a sudden jerk, looks up and cries out sharply, "Bite!" But he did not hook his fish. Another jerk at his hook, and he sings out, "Porgie." How he knew the nibble of a certain kind of fish, 108 feet below the surface, I am unable to tell; and I am skeptical on that point to this hour. But over go the lines of two of the crew, and as their four-pound sinkers carry their hooks down among the coral, each one quickly calls, "Bite," and one begins hauling

in, hand over hand, and soon has a fine red snapper, weighing about twenty pounds, struggling upon deck. In a moment he is pierced in the side, two or three scales below the gills, with a hollow instrument, to allow the escape of the large quantity of air he sucks in as he comes up. He is then plunged into the well, as the other sailor brings up two red snappers, one on each hook, which he soon disposes of in the same manner. The buoy is thrown overboard to mark the spot, and as soon as it can be done the jib is down, the anchor cast and sails furled, preparatory to work. The deck is cleared, all implements brought out, and every man furnished with a line. The sun was about an hour high when the work began, and from that time until nearly dark every one of the crew, including the cook, with the two passengers, seven in all, were busy hauling up the fish from the depths. There was a continual whistling as the wind escaped from the bloated fish, and a splash every moment or so, as they were tumbled into the well. At night I retired nearly exhausted, my hands all burning from the friction of the line, in spite of heavy "half handers," and thick flannel stalls on the fingers most exposed. Many of our catch were porgies, which would have been a nuisance, but for the fact that they came into good play as bait. The porgies were voracious, and with their smaller mouth, sharp teeth and strong jaws, robbed our hooks continually, unless they got the credit due to a villainous little fish called "leather jacket." Of this species we caught a number, but being fit for nothing they were killed and thrown overboard. The next morning we renewed the engagement at six o'clock, and succeeded finely, until sharks came upon the scene and broke several hooks and lines. The captain at once baited his mammoth hook made of five-eighths-inch iron (with a ten-pound red snapper), and attaching it to an inch rope, with about four feet of heavy chain, for contact with the shark's teeth, cast it overboard, and soon had a bite. But the first trial was futile, the hook being dull and clumsily made did not take hold. The next effort was more successful. In less than ten minutes the slack-rope began to slide over the railing of the vessel. The writer, being nearest, gave the rope a hard pull, and fastened the hook firmly. The crew rallied, and for a time things were lively. The captain rushed down into the cabin, and brought up his breech-loader, while the rest worried with a monster shark. After a while he was brought near, and three large balls were put into his head, which so far quieted him as to allow the hoisting apparatus to be fastened into his jaws, when he was hauled up alongside, the liver taken out, the head severed, and the body allowed to drop back into the sea. The liver, after we had taken off quite a quantity of that part where it was attached to the body, filled a half barrel, which had contained a hundred pounds of mess beef, besides the brine and salt, from which we estimated it to weigh nearly 125 pounds. The liver was between six and seven feet long. The shark was estimated to be fifteen to twenty feet in length, and to weigh about 800 pounds. The jaw was given to the writer, and on returning home through Pensacola and Mobile it was a subject of great curiosity in those cities, where such things ought to be common; and he had to sack it up to prevent being made a martyr of by the gathering crowds.

The next shark broke our big hook. Then we tried the grappling hooks, and brought one close enough to put a shot into his head and bring from him a stream of blood; but there being no beards on the hooks the fellow got off. The fifth bite resulted in our hauling up another monster, which broke the hook and ended the excitement of shark fishing, besides compelling us to weigh anchor and move to another part of the banks, where we drifted slowly about till near noon, when it was thought that the well was full enough for the hot weather, so we coiled up our lines and sat down under an awning to rest and cool off. We had between 300 and 400 red snappers in the well. This, of course, did not include those gulleeted, hurt in the gills, or otherwise wounded, nor the numerous other fish which were not considered fit for the market, such as porgies, leather jackets, suckers and the like. Three splendid groupers were caught, four spotted hines, and one scamp; but all of these, except the first, died in the well during the night. We also caught some large lings, but they were too wild for the well, and were cut up and salted down. Leaving the banks at two o'clock, we sailed away for Pensacola, and at dark, as the great light in the tall tower on the mainland was winking at us across the bay, cast anchor off Fort Pickens. The next morning the vessel ran up to the town, dipped and seined the fish out of the well, tied them in bunches with strips of a species of flag, obtained on one of the islands off the Florida coast, and had them in big boxes, in ice, on a steamer, and off for New Orleans almost before one of them was through flopping. Here my friends and myself bade the captain and crew of the *Frances E.* good-bye, and returned to our own little schooner, which we found snugly anchored near the wharf awaiting us.

The fishermen who follow fishing for a livelihood are selfish. At Mobile we found them reticent and chary of information about the snapper banks. They looked upon us with suspicion whenever we began to talk to them upon the subject, and when we mentioned going out with them they seemed to fear we were spies who wanted to ferret out their bonanzas. The banks become exhausted sometimes, and it is quite an item to make a new discovery. On new banks the fish bite so ravenously, and appear so hungry, that they soon rise to the top where they take the hook, making the capturing of them an easy matter, and enabling the crew to fill up in short order. In winter they bite much more freely than in

summer, and nearly always rise to the top, besides not being so choice in their food. It is hard work and consumes time to pull in two large snappers from a depth of eighteen to thirty fathoms. Where the fish are taken near the top they do not suck in so much wind, and are not so apt to die. A fishing crew consists of five men for summer and six for winter. After reaching good banks, they will often fill the well of their vessel with 1,000 to 2,000 fish in six or eight hours. One can imagine how active and expert they must be to accomplish this with hook and line. I have spoken of the diver. He goes down into the well, and passes under that part which is decked over, to see if there are any dead fish, and if so, to bring them out. Those near the mouth of the well can be seen from deck, and brought up with a hook fastened upon the end of a pole. The wells of course vary in capacity, according to the size of the vessel, and have from 250 to 300, and perhaps 400 openings to the sea, say two inches in diameter. If the sea is rough, the change of water is constant; but if it be calm, and the vessel cannot deliver at once, it sails about till the hour for discharging its cargo arrives, or until a rough sea comes on. Otherwise, if the well were full, the fish would die. The fishermen do not believe in sick fish, and rarely, if ever, deliver any that have died in the water. When they show signs of exhaustion, such as coming to the top and "spitting water," they are hooked out and pitched overboard.

It may not be amiss to mention that the liver of the shark is saved for its oil. Its liver is nearly all oil, and will try itself out in the sun in real warm weather. Before noon the next day, after catching the one spoken of, the captain had dipped over ten gallons of oil from the liver, which he put into the half barrel, and the indications were that he would get as much more. While at Mobile a smack lying alongside of us had just come in from a cruise after sharks for their oil, but its crew had had poor success. They ought to have been out with us, with a little stronger tackle, and they might have filled up.

#### For Forest and Stream and Rod and Gun. MY FIRST COON HUNT.

I MAY say, by way of introduction, that I am just over from England, where I have had the pleasure of participating in all the sports fashionable in that country, having hunted the fox, hare and otter, and shot every species of winged game, from the towering pheasant to the erratic flying snipe. My first experience of that most exciting chase, a coon hunt, occurred last fall while I was upon the Illinois River after ducks.

We had gone into camp during the afternoon about one hundred and eighty miles up the river, and had everything fixed in proper order before sundown, and thus had a chance for a shot at the ducks then making their evening flight into the lake about two miles from camp. Three of us went to the lake where we had splendid sport, and returned to camp after dark heavily laden with ducks. After cleaning my gun, which I always do the first thing, and faring sumptuously off the results of our short hunt, I was making myself comfortable, blowing a cloud from a short pipe, with back against a log, my feet to the fire, when the stillness was broken by a couple of dogs giving tongue a short distance away. This started two dogs which were in camp with us at full speed in the direction of the excitement. On making inquiry as to the probable cause of the row, I was informed that Jack Short, a noted coon hunter of the district, was camped about a mile down the river, and that no doubt his dogs had treed a coon. We were quickly assured that something was on foot, as we soon heard two shots fired in rapid succession. Three of us shouldered our guns and started off in the direction of the shots, and just came up to the tree, around which the dogs were baying, as Jack dropped a fike coon out of the top branches. On being told that an Englishman wished to see a coon hunt, Jack was quite willing to oblige the stranger, although he had not intended hunting that night. Jack Short had two dogs; one Growler, an old coon dog, and the other a young one just learning the business. And we had two; one a foxhound, and the other a cross between a mastiff and a hound, but Growler was the only one worth anything except for making a noise.

On being ordered by Jack, old Growler broke away into the thicket; the others stopped with us. After walking some distance without hearing a sound from Growler, Jack remarked: "We might as well sit down and rest, as we would hear nothing from the dog until he got on the trail of a coon, and that we might now be traveling in the wrong direction." We hadn't long to wait, for soon after sitting down we had notice from Growler that a coon was on foot. At the first sound the three dogs with us dashed off to join in the fun. Growler seemed to be about half a mile east of us, and when the young dogs joined him the woods fairly echoed with the music, the deep tone of the mastiff making not an unimportant addition to the harmony. We now started off at a run after the dogs. After running a short time the chase turned towards the lake, and Jack expressed a fear that our chance of getting the coon was a forlorn one; but the dogs were still running, so we kept on. Jack suddenly stopped, and after listening awhile remarked, "They have treed him;" and sure enough they had driven him into an old hollow stump of a tree standing near the edge of the lake in about six inches of water. When we got up Jack asked Growler, "Is he there, old fellow?" The old dog sniffed round the trunk, and then threw back his head and gave a long howl; this settled the ques-

tion in Jack's mind, as he said he never knew Growler to make a mistake. Yes, the coon was treed; but how to get him out of his stronghold, was the question. The trunk was about twenty feet high without any branches, so we could not climb it; and we had no axe with us to cut it down. Everything of a combustible nature was either thoroughly wet or too damp to burn, and as fire seemed to be our only means of dislodging him, we all, except Jack—who stopped with the dog—started for dry land. In about a quarter of an hour we had collected sufficient dry material for our fire, which we soon started; and, as the wind was blowing pretty strong, we soon had the trunk changed into a miniature blast furnace. My hopes of the coon being there were fast falling, for as the flames kept rising higher and higher, I had no idea that any animal could stand for an instant the heat and smoke that were driving up through the hollow stump. Growler was, however, correct, as in a short time out jumped the coon and sat on the top of the stump on his hams just like a bear, and looked disconsolately round on his pursuers. There was an immediate cry for me to shoot him, but shooting was the last thing I thought of doing, so I suggested we should knock him off and let the dogs kill him. This seemed to meet their views; but, as none of us were base-ballists, it was some time before a lucky shot dislodged the coon, and down he came among the dogs, who had been anxiously watching our operations. Now began the fun, the dogs and coon rolled and tumbled round in the water, while we jumped and shouted on the bank. It was the only thing I ever saw that equalled the excitement of being at the death of an otter, when the dogs are allowed to do their own killing and are not assisted by the men who spear the animal and call that sport. The coon was soon dead, so we made our way to dry land and started old Growler off again. We kept up the hunt until after four o'clock, when the moon went down and left us in darkness. We captured three more coons, but these we had to shoot, which did not afford any sport in comparison to the first death. After the excitement of the hunt was over, I think I never was more tired and sleepy. We arrived at camp all right and found a good fire burning, so I dried my clothes and laid down to sleep, too tired to dream of my first coon hunt.

## Fish Culture.

### CALIFORNIA SALMON.

TOLEDO, O., Aug. 28, 1877.

EDITOR FOREST AND STREAM:

I see in No. 25 of the last volume of your paper an account of the taking of a California salmon (*Salmo gairdneri*) in Lake Ontario, under the signature of Sam. Wilmot, in which he claims "the credit of heralding to yourself and your readers the capture of the first Californian this side of the Pacific slope." If Mr. Wilmot will refer to page 29 of the Ohio Fish Commissioners Report for 1876-77, he will find the following, in my report to them, dated January 13th, 1877: "In the fall of 1874 the Michigan Fish Commissioners planted some young California salmon in the River Raisin, and in the fall of 1876 (Oct. 1st) Messrs. Davis Brothers, of Toledo, caught at Cedar Point, Maumee Bay, a salmon of that species thirteen and a half inches long, a healthy fish, perfect in color and flavor." I also, in November last, communicated this fact to the Michigan Fish Commissioners, which was fully noted in the able report of Mr. George H. Jerome, Superintendent of the Hatching in that State, for 1876-77. In the spring of 1876 I placed in the rapids of the Maumee River, twelve miles above Toledo, over a thousand young California salmon, and, in May this year, a number of them over five inches long were taken with a hook at that place. I ate the salmon taken by Messrs. Davis Brothers at Cedar Point, and am not mistaken in the fish. I made a pen sketch of it, and sent it to Prof. Baird, at Washington, who pronounced it a genuine California salmon.

I write this, not that I think there is any particular merit in heralding to you or your readers the capture of the first California salmon taken this side of the Pacific slope, but merely to vindicate the truth of history. Very truly,

EMERY D. POTTER.

[A California salmon was also taken from the rapids of St. Clair River, Michigan, last fall, being probably the result of spawn deposited in Black River, Michigan, in the fall of 1874. Salmon have also been caught in the Great Nemaha River in Nebraska, as before noticed in these columns.—Ed.]

MASSACHUSETTS.—The last work of the Fish Commissioners was the shipment of four cases of shad fry to Smith's Ferry, where they were placed in the Connecticut. There have been hatched at the Smith Hadley Falls Hatching House, the past season, about four and one-half millions of shad fry.

NEW JERSEY.—Twenty thousand salmon fry, hatched at the Thompson establishment, New Hope, Buck's Co., have been during the last year distributed in the waters of New Jersey, including the Delaware River.

TENNESSEE.—Prof. A. W. Brayton, of Chicago, D. S. Jordan, of Indianapolis, and other gentlemen connected with the United States Fish Commission, are making a tour of inspection through Tennessee, Georgia, and Alabama. This work is preparatory to the intended stocking of suitable waters with shad.

—Seth Green writes to the *Rochester Express* that he does not believe that fish sleep.

## Natural History.

### NOTES ON THE NATURAL HISTORY OF SOUTH WESTERN TEXAS.

BY DR. BENJAMIN F. POPE, U. S. ARMY.

FIRST: Is there a carp indigenous to American waters? Unless I am misinformed the carp has not yet been discovered in American waters, except as placed there by pisciculturists and by migration from their original points of deposit.

Perhaps it may be of interest to your readers to know that two months ago some fish were brought to this port by a strolling Mexican which, if they do not prove to be the veritable *Cyprinus carpio*, are certainly marvelously like unto it. Unfortunately, the fishes were both scraped and cleaned before being presented for sale, but there was enough of the specimens left for me to give a fairly accurate description of their distinctive features.

They were rather broad, flat bodied, and averaged thirty-two inches in length and when fresh must have weighed from eighteen to twenty-two pounds. There was a single, long, soft rayed dorsal fin, reaching from the middle of the back to the tail, which was forked; the ventral fins, also soft rayed, were placed behind the pectorals. The scales, although removed by scraping, I judge to have been very large from the size of their matrices, and they were arranged in twelve longitudinal rows between the dorsum and ventrum. For so large a fish the head was remarkably small and compressed, its nostrils prominent, mouth diminutive and placed well underneath; the lips were fleshy and nearly three quarters of an inch broad; there were no teeth on the jaws, but the pharynx was well armed with them; whether there were any barbels I do not know, as they might have been removed as were the scales.

I can give neither their color nor skin markings for reasons already stated. The flesh was pink and tolerably firm, free from bones and of a muddy flavor.

The fishes were said to have been taken in what is known as Toyah Lake, a body of soft, still and rather muddy water—a pond we would call it in the north—which is laid down on Major Moore's map of explorations in South-western Texas (1869) as being in about latitude 31 deg., 20 min., longitude 103 deg., 50 min., not over thirty-one miles south of the Pecos River, with which it was probably connected at some remote period of the Geologic history. Its distance from Fort Stockton cannot be over fifty miles north-west.

Last September, Captain N., of the 10th U. S. Cavalry, and myself, with his command, when returning from a scout to the upper waters of the Pecos River and the Guadalupe Mountains, attempted to reach this pond by going east from a point on the river which was about forty miles above "Horsehead Crossing."

We failed to strike it, however, and were obliged to put back to the river, because our animals had been thirty-six hours without water. During the coming autumn we hope to visit this locality, which until very recently has been almost unknown to white men. I shall then make every endeavor to secure specimens of the fish for a more accurate examination and for preservation. I feel quite confident that it will prove to be an indigenous variety of the *Carpus cyprinus*, and that a new fact in regard to the distribution of the species will be established.

Second: The Vinegrone.

There is a peculiar insect found near the Fort, which, if it has not already come under observation, cannot fail in being of interest. Nowhere do I remember to have met a description of this member of the *Arachnid* family, though it may be my own fault, as my reading has not tended in this direction, and there are no books on the subject now at my command.

Among our native Mexican population who seem particularly to dread its appearance, it is known as the "vinegrone," a contraction, doubtless, of the words *vinegre-grand*, or big vinegar. The name is a descriptive one, and arises from the insect's habit of ejecting a pungent, irritating secretion, which has the odor and chemical reaction of vinegar or acetic acid; and for this reason, if for no other, I think the name a good one.

In general appearance, the vinegrone much resembles a large scorpion, though evidently not belonging to the same family. From the head to the commencement of the tail, the adult specimen measures fully two inches in length, and is about three-quarters of an inch broad. Its color is reddish brown and grayish white between the articulations. The thorax and head are amalgamated, while the thorax and abdomen are separated by flexible tissue which is so constructed as to give the insect somewhat of a waspish appearance. Its legs are six in number, with thoracic attachments; they have each five articulations, differing in length, and are covered with bristles or hairs; the first articulations form the anterior covering of the thorax. The trunk and head are protected by a single dense, black dorsal plate; the abdomen has sixteen distinct dorsal and ventral laminae or plates, which overlap; they would form continuous rings, were it not that they are curiously separated laterally by elastic tissue, in which the open mouths of the respiratory ducts may be seen. This division of the abdominal rings affords considerable flexibility and gives the insect the appearance of bearing about him an

old-fashioned bellows. When he is full the bellows are distended and the plates are widely separated; when fasting, it is collapsed and the laminae approximate.

From the terminal, dorsal and ventral plates is given off a series of rings, which, after the third one, are fused into a stiff spike or tail, that is usually three-fifths or the length of the entire body, and covered with short-bristles like the legs. So far as I can ascertain, this is not a sting, nor does it seem to be the duct through which the secretion is ejected. It appears to be used principally as a posterior feeler, and sometimes as an aid to locomotion, as in the tail of the kangaroo. In several instances I have noticed that it was used in the recognition of one of its own species—by a caressing motion in which the other seemed to take some delight. I have also seen them crossed, as are the foils of a fencer, before their combats, which are particularly fierce at times.

From the head are given off two large and powerful brachials, each having four articulations. They much resemble the arms of a scorpion, and terminate in sharply curved lobster-like pincers. For purposes of prehension, nothing could be better devised, and the threatening manner in which they are opened and stretched out when the insect is enraged or is seeking for its prey, almost makes one shudder. But the brachia are not its only means of offense. Beneath the frontal plate are seen two long incurved fangs, covered with red hairs at their bases and blackened at their tips. Connected with these are two sacks, that, by pressure, exude drops of greenish liquid over the fangs, and in them undoubtedly resides the true venom of the insect.

Behind the arms arise a pair of long *antennae*, or feelers, that have five articulations, each. On the frontal plate, near its anterior extremity, are two small white eyes, placed close together, and each about the size of a pin's head. Though immovable, as are the eyes of all insects, they are apparently of good service, as they look directly forward and upward.

The habitat of the vinegrone embraces quite an extent of country bordering on the 32 deg. parallel of latitude. I cannot give its precise limits, but it seems to be frequently met all over southwestern Texas, and thence to the Rio Grande. I have not yet sufficiently observed its habits to be able to give a life history of the insect. I know, however, that it is a ground-liver and a night-walker; it haunts old houses, is found under rocks, burrows in adobe walls and infests the mud-daubed roofs of Mexican *hacals*. Its courage is beyond question, and its agility and ferocity make it the deadly foe of the centipede, tarantula and orange-winged wasp; each of which articulates attains gigantic size in this region. I have no good proof that the bite of the vinegrone would be fatal to man, except perhaps as it might be supplemented by the shock of an excessive terror; but that it would be dangerous, I think highly probable. As an experiment, I confined two of them in a small box with a large bat. The next morning the bat was dead, having been killed by them during the night, when it is supposed to be most agile and wary. I placed another unsavory specimen in a large bottle, in company with a large wasp and a tarantula. The vinegrone killed and devoured them both in short order.

I am inclined to think that the acetic fluid, which seems to be secreted in abundance, is for the purpose of sexual attraction; though of this fact I am by no means sure. It may be a means of defense, and perhaps of offense, since in my wasp and tarantula experiment they both seemed sluggish and stupefied by the powerful odor that pervaded the bottle. I inclose

a rough sketch of the subject of my note, which may possibly be recognized as an old acquaintance by many of your readers, and may be of interest to those who have not met the villain in person's propriety.

Fort Stockton, Texas, May 25, 1877.

[The above notes cannot fail to be of great interest both to the ichthyologist and entomologist.—Ed.]

**THE RIBBON FISH.**—I observe in your last issue a note on a species of ribbon fish (*Regalecus*) taken in the Mediterranean, from the pen of Frank Buckland. As it brings to remembrance the capture of a remarkably large specimen of the genus in the Bermudas during a visit I paid to those islands in the winter of 1859-60, I may perhaps be permitted to make a few observations on the subject. The specimen in question was the largest ever taken in any part of the world, measuring no less than sixteen feet seven inches in length, and the filaments upon the head forming a magnificent plume-like crest, nearly three feet in height.

As I suggested at the time when describing the fish in different journals, there is hardly a doubt but that monstrous specimens of the *Regalecus* are the "sea-serpents" we hear of at intervals. I have taken the trouble for some years to collect all the accounts of such occurrences, and in one instance had the good fortune to prove from personal examination of the testimony of a Norwegian gentleman who had encoun-

tered one of these monsters off the coast of his native country, that the creature—some sixty or eighty feet in length, the head and crest of which were raised above water in close proximity to the boat in which he sat—was in reality a huge *Regalecus*. Again, the description of the "sea-serpent" seen by Captain M'Quibbe and the officers of H. M. S. "Dredalus," tallied so exactly with that of a *Regalecus* as to leave no doubt of its having been one, and several occurrences I can bring forward very closely to prove that the *Regalecus* and "sea-serpent" may be considered identical; and I have every reason to believe that sooner or later one of these monsters will be taken to prove the truth of my assertions.

One fact I desire to make known to any one who has the good fortune to be present at the capture of such a fish, is the delicate nature of its substance, so delicate indeed that, in the case of my Bermudian specimen, the mere lifting of it up was sufficient to mutilate its parts. It will therefore require very tender handling, and if killed by a shot and lying alongside a vessel, the captors should not attempt to haul it on board in the usual rough way, but lower a large sail in which to collect its folds, and then hoist on deck.

Haitfax, N. S., Aug. 21, 1877. J. MATTHEW JONES.

**PENGUINS AT ST. PAUL'S ISLAND.**—A recent writer (M. Velain) in the *Revue Scientifique* speaks of the curious habits of these birds as follows:

"In that bleak and inhospitable island, situated in the southern hemisphere, a certain kind of penguins, called goorcoos, much more ungainly than their northern brethren, live in swarms. But they only resort thither in the summer months, or a little before, from August to March; they lay their eggs in September, and always return to the same spot. Nimble as they are in the sea, where they swim with astonishing speed, they are excessively awkward on land, where the utmost they can do is to keep themselves upright on their paws and hop about, their wings being utterly unfit for flying. And yet these birds will only build their nests on high plateaux, which they cannot reach except by desperate exertion. Many a time the poor penguin, after nearly arriving by a steep ascent at the brim of its plateau, will roll down again, a treacherous stone having given way under its paw. Nothing daunted, the poor fellow will recommence his task, until, sometimes covered with blood, he gets to the top. These creatures arrange their nests so as actually to form a village, with streets, lanes and public squares. Here they chatter together, making an awful din, and generally turn their snow-white breasts to the sea; their heads are adorned with yellow tufts. The crews of the *Fernand* and the *Dives* used to visit their village, christened by them Penguinville, in order to have a good laugh, the grotesqueness of their postures, coupled with their gravity, being well calculated to cause gaiety. On the arrival of the visitors there always was a great turmoil and chattering, but after a few minutes quiet was restored, and each bird continued to mind its own business. The men lived with them on the best terms. Notwithstanding the great labor attending the ascent, the penguins used frequently to return in troops to the sea, an excursion which did not take them less than half a day; but they always returned with provisions to last them nearly a week. The young are hatched in September, and then have a greyish tint. It was a curious sight to see them marshalled some days after on the public square, and watched by grave personages who knew how to punish them if they did not behave. Under this severe surveillance they were fed several times a day. Woe to the little imp that attempted to snatch a morsel when it was not its turn."

**WILD TURKEYS.**—An extract in the *FOREST AND STREAM* of Aug. 16th, touching the habits of the wild turkey, is not altogether uninteresting; but is so erroneous that I crave a space in your columns for the purpose of correcting the writers' assertions. No greater error exists than that the wild turkey is unable to rise from the ground in its passage across streams, or upon other occasions; or that it is accustomed to seek out the highest points and mount into the tallest trees for that purpose. It seeks such places to roost at night. I have hunted them more or less every season during the past fifteen years, have observed them under many circumstances, and found them as quick and strong of wing as any other game bird except, perhaps, the quail, and when flushed from their covert either in or out of the timber requiring the same degree of expertness in bringing them to bag. Indeed, I have seen an old gobbler of eighteen to twenty pounds weight take wing at the water's edge of the Missouri River and fly across it, a distance of half to three-fourths of a mile, in as straight a line as a quail, a grouse or a duck could have flown the same distance. I have often been foiled in pursuit of them by the whole flock performing the same strategic movement before I could approach near enough for a shot. I have no desire to discuss the gastronomic qualities of this bird. Persons differ in tastes; but for me the wild turkey of this locality is far the most preferable for the table. Both as to quality and whiteness of its flesh it is superior to that of its domestic congener. These with other well-known distinctions between the two species go far toward the correction of the other assertion that, "The tame turkey is a direct descendant from the wild," meaning, I suppose, the wild turkey of the United States.

BOB WHITE.

[The above strictures are true in part; but did the writer ever see a flock of turkeys on their travels and just previous to crossing a river? We have, and on that very Missouri River too, and the fuss they made before taking wing put us much in mind of the barnyard species, who, though he uses the same perch to roost on each night, goes round and round, all but flying, and then hesitating, walking off to take a new survey as if in hopes of finding some newer and easier way of accomplishing the feat. Wild turkeys can take wing with very rapid flight when startled, but they are a lazy bird, and when strutting at their leisure, like some other bipeds, always take the greatest trouble to accomplish a little matter. When crossing rivers wild turkeys are given to the very acts stated in the article to which our correspondent takes exception.—Ed.]

**CAPTURE OF A RARE BIRD.**—The *Columbus* (Ga.) *Enquirer* recently published the following note. We presume that the specimen was not preserved, although it certainly should have been:

We were shown a great curiosity the other day by Mr. T. Bryant, one of our river pilots, who has been spending some months on the south Florida coast. It was a scarlet flamingo,

now a very rare bird, but formerly quite plentiful along the Louisiana coast. It is six feet or more tall, and about five feet from tip to tip of extended wings. Its feathers are a beautiful scarlet of different shades, the wing feathers are jet black and, with its gaudy uniform, it must present quite a soldier-like appearance among the coast birds. It was killed at the pass of Sarasota Bay, Florida, with two others. They are shaped something like a crane, are about eight feet in length, with neck, legs and body about two feet each, and have webbed feet. They are a very shy and graceful bird, and are seldom seen even by the frequenters of the south Florida coast.

**Syracuse, N. Y., Aug. 14.**—Why are fish so much affected by the course of the wind—at times, with the wind at a given point, taking the bait readily, and refusing to do so with the wind in opposite direction?

**Ans.** We can't answer your question. Atmospheric changes affect the higher vertebrates as well as fishes, but these matters have not yet been studied, and cannot at present be satisfactorily explained.

**THE FLIGHT OF BIRDS.**—In regard to the flight of birds, I think that there is no necessity to resort to such theories as the figure of 8 motion to understand how a bird flies when it beats the air with its wings. I think that the formation of the feathers, and their imbrication in the wing, ought at once explain that kind of flight. When the bird makes the down stroke, the wing offers a solid resistance to the air, and the motion imparted to the body of the bird must be upward. The wing must then be raised to come into position for another stroke. In so doing, each feather lets the wind pass through in an oblique manner, which causes them to act as sails on a windmill or on a ship, thereby propelling the bird forward. The bird instinctively knows how to direct these strokes, as it wishes to ascend, descend, or move straight forward. The effect of the down stroke can be seen when a large bird such as a turkey buzzard begins to fly in a place where there is not room for rapid headway. Each down stroke is more violent than the up one, and the body is jerked up each time.

A flying machine might be made so that the wings would have a sufficient resistance to the air to keep it up, and the propelling part could be arranged independently. But there is another mode of flight that has puzzled the minds of men. It is a remarkable thing that man has seen beyond the Milky Way, and is now studying the constituents of the sun, yet he cannot understand the sailing of birds. I have seen many attempts, but they all fall short of the mark. I have seen buzzards with outstretched wings rise in a spiral course, when in was so calm that a leaf on a tree was not moved. I have seen the frigate bird wheel in graceful curves upward when the sun was as smooth as a mirror. I have seen the buzzard sail near y in the eye of a strong wind without any other motion being perceptible than a little balancing. I have looked down hundreds of feet on them as they sailed beneath me, and never could detect any motion of the wings. The theory of inclined planes will not explain it. I have also noticed large butterflies float about in a most heaven-like enjoyment, in some cozy opening among trees, on a fine summer evening, when there was not a breath of air, without once moving their wings, as if they were some disembodied spirits that had neither attraction or gravitation, but only will. I have seen a motion very similar to the sailing of birds in fishes. I saw a number of porpoises sailing immediately in front of the prow of the steamer. They were packed quite close together, and moved exactly as fast as the steamer. As it was necessary that they should breathe occasionally, they were continually rolling over each other to come to the surface. Sometimes half the fish would be out of the water, yet the uniform motion was kept up, and no one on board could detect any motions of fins or body to warrant such speed. There are other modes of flight such as by bats and insects, the dragon fly as an instance; but the sailing of birds is a most interesting study for philosophers, and it will be safe to say that man will never be able to put it in practice. But the knowledge may come in play in explaining some things yet in embryo.—*Scientific American*.

**THE PIRIA.**—This is the *Serrasalmu niger*, black, saw-bellied salmon (*Arrectus piranda*) or sharp fish, described by Schomburgk in his "Travels in South America." "This voracious fish is found plentifully in all the rivers of Guiana, and is dreaded by every other inhabitant or visitant of the river. Their jaws are so strong that they are able to bite off a man's finger or toe. They attack fish of ten times their own weight, and devour all but the head. They begin at the caudal fin, and the fish being thus left without the principal organ of motion, is devoured with ease, several going to participate in the meal. Indeed, there is scarcely any animal which they will not attack, man not excepted. Large alligators, which have been wounded in the tail, afford them a fine chance of satisfying their hunger, and even the toes of this formidable animal are not free from their attacks. The feet of ducks and geese which are kept in the neighborhood where they are plentiful, are almost invariably cut off, and young ones devoured altogether; and in these places it is not safe to bathe, or even to wash clothes in the river, many cases having occurred of fingers and toes having been cut off by them. They are a principal article of food among the Indians, they being, however, dry and indifferent, and rather bony. The piria or numa, by which name the fish is known to the aboriginal tribes of British Guiana, inhabits the rivers which intersect that fertile colony. They are not to be found within forty miles of the coast, nor are they plentiful at the upper part of the rivers. Their favorite haunts appear to be those parts of the rivers which are between a hundred and a hundred and fifty miles from the coast, chiefly if there be large blocks of rocks, about which they hover to procure themselves worms, etc. The ovary in the female is double. They deposit their spawn in the currentless inlets which form so peculiar a feature in the rivers of Guiana; this occurs during the months of January and February, at which period we found the females generally destitute of roe. They are caught with hook and line, and their greediness is so great that no art is necessary to conceal the bait. The hook may be baited with a piece of fish, bird or animal, or merely their entrails; the piria will dart at it the instant it is thrown into the water, and seize it with eagerness, but it frequently happens that with its sharp teeth it bites the line and escapes with the hook in its mouth. We therefore surrounded the line where it was fixed to the hook, to the length of two or three inches, with tin or lead, and though it had a clumsy appearance we were not less successful. Some precaution is necessary even after the fish has been lifted out of the water, or it will inflict in its struggles serious wounds; the angler has, therefore, a small bludgeon ready, wherewith its skull is broken.

A NEW FISH DISCOVERED.—Mr. G. Brown Goode gives the following description of the new species of flounder, which has been found by the United States Fish Commission: "On Monday the dredging party discovered, ten miles off Salem, a fish entirely new to America—the Pole or Craig flounder (*Glyptocephalus cynoglossus*), heretofore known only from the arctic coasts of Europe. This fish appears to be a resident of Massachusetts Bay, since both adult and young specimens were taken in considerable numbers. It does not take the hook, and its existence had not been suspected. The largest weighed about four pounds, and is doubtless an excellent table fish. Another small fish (*Ioeius uncinatus*), hitherto known only from Greenland, was also taken. During the two summers' work on the southern coast of Massachusetts, several new fishing grounds were discovered."—*N. Y. Times*.

THE AQUARIUM.—The special expedition to Bermuda for tropical fishes was very successful. Last Monday, as a result of this trip, more than three hundred rare and valuable specimens were placed in the tanks. Among the specimens are ten yellow tails, thirty yellow grunts, male and female; fifty of the celebrated angel fishes, five four-eyed fishes, a group of butter fish, gray snappers, Margate fish, with changeable colors; twenty breams, twenty pink squirrel fishes, fifteen spotted kinds, fifteen Hamlets, fifteen Bermuda lobsters (a very odd creature), ten cow pilots, several surgeon fish, ten rare sunflower anemones, corals, a young frigate bird, and several marine curiosities. The Aquarium is now even more interesting as a place of resort than ever.

BIRDS OF CENTRAL NEW YORK.—In the *Auburn Daily Advertiser*, Aug. 14, Frank R. Rathbun publishes a full list, with classification and notes, of the birds of Cayuga, Seneca and Wayne Counties. This list, it will be remembered, originally appeared in this journal. It is worthy of more permanent form than the columns of a newspaper.

—A New York taxidermist has during the past summer stuffed sixty pet canaries. Forty of these were in such poor feather that he was obliged to supply their places with yellow birds, which he said answered every purpose, so long as the owners were blissfully ignorant of the exchange.—*Boston Journal*.

—Orocles, blue birds, cat birds, wrens and swallows, hitherto not known in the neighborhood of Virginia, Nevada, have made their appearance there this summer.

ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING AUG. 14, 1877.—One racer (*Scotophilus allegensis*), presented; one Cuban tree (*Euphorbia ugulifer*); three pink squirrel fishes, presented; one Savannah deer (*Cervus savannarum*), born in garden; one loggerhead turtle (*Thalassochelys carolina*), presented; one six-banded armadillo (*Dasypus sexlineatus*), purchased.

For Week Ending Aug. 21.—One raccoon (*Procyon lotor*), presented; six Gillespie's hair seals (*Urophysa gillespiei*), purchased; one white rat (*Rattus albus*), presented; three copperhead snakes (*Crotalus horridus*), purchased; eight water moccasins (*Amphibatrachus piscivorus*), purchased; live black snakes (*Buconan constrictor*); two grass snakes (*Ophocauda ventralis*).

## Woodland, Farm and Garden.

### IMMORTELES.

IN France, as in this country, an affectionate remembrance of the dead is manifested by periodical votive floral offerings, which relatives and friends lay upon or suspend over the last resting-places of those who were dear to them in life. As emblems expressive of that higher existence which, perhaps, in their inmost hearts, most men desire to lead, even on this "sin-worn world," flowers, in their lovely and innocent lives, are the most appropriate objects which the whole range of nature can present. But even here, amid the highest and purest forms of beauty granted to human perception, occurs the humbling sense of the instability and fugaciousness attached to all sublimity things. In the expression of that devotion which attributes to the memory of the departed excellencies lightly, or it may be hardly at all recognized amid the induced upathy and "dreary intercourse of daily life," the mind, purified by loss, and by the reflection that all other atonement is late, would not only present the most beautiful offering that earth can afford, but endeavors to make the token as lasting as possible. And so the flowers of the Immortelle or Everlasting offer themselves among the thousands of other flowers, many more beautiful, but none so fitted to grace the long repose of the tomb.

This plant, known to botanists under the name of *Helioscymum orientale* was originally a native of the north of Africa, the Island of Crete and some parts of Asia. Although known in Europe since 1629, it was not generally cultivated in gardens before the year 1815. At present, it is chiefly grown in Lower Provence, in the south of France, where the land gradually inclines to the shores of the Mediterranean. It comes to the greatest perfection on the slopes of Bandols and Ciotat, in positions well exposed to the sun, and surrounded by dry stone walls, where it commences to bloom in June. It is seriously injured by much rain, and to some extent even by heavy dews. It does not thrive in any soil that is not light, sandy or stony, or porous. It is propagated by division of the larger tufts. The flowering stems are gathered in June before the flowers are fully expanded. As both immature flowers and those which are too full-blown are rejected in the market, it is important that the stems should be cut, neither too soon nor too late. The flowers are gathered by women, who make them up into small bundles, which are usually placed to dry on the stone walls of the inclosure in which they grow. When

properly dried, they are taken away by young girls, who are employed to remove the downy covering from the stems. A pound weight of the dried plants contains about two hundred stems, each bearing on an average twenty flowers. Each tuft of the growing plants produces from sixty to seventy stems. An acre of ground contains about 16,000 tufts, which will annually yield from two to three tons weight of dried immortelles, and a well established and well managed plantation will continue productive from eight to ten years. The flowers are sold either by the bundle or weight, the bundles ranging from three to six cents each, according to size, while if sold by weight, the price varies from three to five dollars per cwt., according to the state of the market. The natural color of the flowers is a deep yellow, but the manufacturers of garlands, bouquets, wreaths, etc., dye large quantities of them in other colors also, chiefly black, green and orange red. This last named color is very handsome, and is the favorite tint of the people of the south of Europe. It is said to be obtained from a preparation of borax. Large quantities are also bleached white with a preparation of chloride of lime, and with the natural yellow flowers and those which are dyed black, are used to form the wreaths and other devices devoted to the dead. Those which are dyed of brighter colors are used either alone or mixed with natural flowers for bouquets or room decoration—in these, however, the immortelle takes no very prominent place among other flowers. Its great distinction from them seems to consist in its possession of those peculiarities of structure which have induced a nation of sentiment and refined taste to select it as the most fitting of all to fill the office and bear the title of "The Flower of the Grave."

### A FOREST SCENE IN CENTRAL AMERICA.

WE were now in the midst of a dense pine forest, with tall trees—every one fit for a spear for the Titans when they warred against the gods—on either side of us. The rude little path which the settlers have hewn out of this dense wooded mass is every now and then barred by one of these forest giants, which the wind has thrown athwart. How painfully silent are these fir forests of the North Pacific! At one portion of my life it was my happy lot every morning to walk through part of a great tropical forest in Central America. Fragrant odors of many flowers and spices were wafted in the sultry air, and everywhere the forest rang with the scream of tropical birds of gorgeous plumage, and the chatter of the long ring-tailed monkeys, which swung themselves from branch to branch and tree to tree, in utter astonishment at this degenerate descendant of theirs, who was permitted to walk aloft, while they disported themselves among the leaves of the india-rubber trees, and ate the luscious fruits from among the waves of flowers which rolled from forest tree to forest tree, until, as you looked from a rising ground, the whole expanse of country before you seemed in places like a sea of foliage and flowers. Above all, filling up as it were every vacant space, was the never-ceasing din and hum of insect life which arose from among the trees. That forest seemed like one huge temple, where ten millions of unseen choristers sang a never-ending hymn of praise to the "Unknown God!" Here, 40 deg. to the north, all is different. There are odors, but they are those of the fir-trees and turpentine, and you may listen for hours without hearing the sound or beholding the sight of a living being. We sit down and draw breath for a few minutes. From overhead comes a gentle tapping, and from a tree close at hand another similar sound; we look up and find that it proceeds from two species of wood-peckers boring the trees for insects. They are *Audubon's Picus Harris* and *P. Gairdneri*, the only two species found on the island. We almost repent what we said about the scarcity of life in the forest, for down jumps from a tree a little brownish squirrel, which stares at us for a second, then, tail on end, skips along a fallen tree, tears open a fir-cone, extracts the seed, and then skips off on the errand he is bound. There are several species of squirrels in the North Pacific slope of the Rocky Mountains, but this is the common one (*Sciurus douglasii*). In the mild climate of this region it does not hibernate, but may be seen all the year round jumping about, fearlessly approaching the traveler, and then tossing up its tail as it runs off scolding and barking. As we are moving off, a pretty fawn ambles into the pathway just before us, again trots into the bush, and in a minute is lost among the thick foliage.—From "The Countries of the World," by Dr. Robert Brown.

—From a work on the *Materia Medica of the Hindus*, recently published by Mr. George King, of the Royal Botanical Gardens, Calcutta, it appears that, notwithstanding the present extensive growth and use of both tobacco and opium in India, neither of these narcotics were known there in ancient times. Opium was introduced by the Arabs, and tobacco was brought hither by the Portuguese from America about the end of the sixteenth century. The "far country" whence the "sweet cane" was brought was India, and our modern word sugar-candy is made up of the two Sanskrit words *sarkara khanda*.

—The marshall of Tampa, Fla., protects a large alligator in the river adjoining the town, in consequence of its valuable services as a scavenger.

—Banana culture is successfully pursued in Southern California.

### THE USEFUL PLANTS OF MEXICO.

IN the Centennial Exhibition last season Mexican products came in for a fair share of representation, the useful plants of the country being not only abundantly shown, but also fully described in the catalogue of Mexican exhibits. This catalogue, useful as it is, would have been much more so had more care been taken in the scientific nomenclature; not only is the spelling faulty, but the specific names of many of the plants are absolutely unidentifiable. The occasional descriptions of Mexican scenery give a tolerable idea of the natural features of the country. Thus: "Besides the beautiful landscapes presented to the traveler by deep ravines, the elevated mountain tops and the splendid vegetation found all along the road, there are other objects which increase the attractiveness of the picturesque views. On leaving the City of Mexico, the beautiful lakes of the valley and the elegant tops of the Potocatepetel and two Xxtalehuatl, ever crowned with whitest snow, are presented to the eye of the observer. In San Juan, (T.) Leotihuacan, again are seen the pyramids raised by the Toltecs, and dedicated to the sun and the moon. Further on are seen the extensive Magney fields, that precious Agave (*A. Americana*; [described in Cat.] of which intoxicating liquors and the famous pulque are extracted." This pulque is as much a national beverage in Mexico as lager beer is becoming with us. In small or moderate quantities medicinal or hygienic properties are attributed to it, but in large quantities it is intoxicating. The fibre is valuable, not only for making ropes and cordage, but also for paper, which is said to be remarkable for its whiteness, elasticity and strength. It is made in large quantities in Mexico, and so abundant are the plants that the supply is inexhaustible, and the cost of the material very trifling.

Between the high summits of the Mexican volcanoes which tower at about 18,000 feet above the level of the sea down to both shores on the Pacific and the Gulf, there are a great many intermediate degrees proper for the most varied types of vegetation. The "Guayabas" (*Paidium*), the Anonaceae, Acacias and other plants live and grow abundantly in the low lands, where coffee and sugar can be cultivated under the most favorable conditions. Leguminosae and Ericaceae notably occupy the medium height, and the Coniferous and Cupuliferous plants climb up to the limits of perpetual snow. Several families seem to be adapted to a variety of climates, and their genera are found at different levels, living even in dry and rocky grounds. Among these may be mentioned the Bromeliaceae and Amaryllideae, which occupy the greater part of the Mexican Mountains. In the list of medicinal products eighty-six plants are enumerated, showing that this application of the vegetation of the country received a large share of attention. Gums, resins, and vegetable waxes were also numerously exhibited. The resin obtained from *Hymenocoumaril* seems to be known by the name of "Coapinol." It is used extensively in the manufacture of varnishes, in the same way as true copal. Large quantities are collected in the State of Oaxaca, and sold in the city of Mexico at one dollar a pound. A resin called "Peuca copal" is exceedingly abundant, and is said to be produced by *Elaphrium copalliferum*. Under the name of "Brea" is described a resin which is said to be "the result of the distillation of the turpentine from the *Pinus tecote*, which grows in the cold districts of Mexico." This "Brea," when dissolved in warm alcohol, precipitates after cooling, becomes pure and takes a white color. It is used in the preparation of illuminating gas, and in the manufacture of soap.

From a description of the "chayote" (*Sesuvium edule*) we learn that the plant grows luxuriantly, yielding abundant fruit the first year. Under favorable circumstances a single plant produces annually from eighty to one hundred fruits. It is of very easy cultivation, and is grown extensively for the sake of the fruits, as well as for the great tuberous roots, which contain a large quantity of starch or arrowroot, both of which are eaten.

J. H.—Your plants from the White Mountains gave great pleasure; they are: No. 1, *Potentilla tridentata*; No. 2, *Artemisia Canadensis*, Arctic Sandwort; No. 3, *Diapensia Lapponica*; No. 4, *Loiseleuria* (syn. *Azalea*) *procumbens*; No. 5, *Lycopodium lucidulum* (the first time we have seen it from so high a latitude), and No. 6, *Lycopodium selago*, a fine specimen and very rare.

X.—The Ascension lily is *Lilium candidum*. It is often seen in pictures of the Virgin Mary, by old masters. It is also known as St. Katherine's lily.

P. J.—*Ecochorda grandiflora* is one of the numerous ornamental shrubs introduced from China by Mr. Fortune, who traveled in that country for several years. It is a most distinct and perfectly hardy shrub, and deserves far more general cultivation than it has heretofore received. It is of neat, shrubby habit, growing with us from six to eight feet high, and, like the *Spiraea* and *Weigelia*, requires a little pruning and trimming after it has done blooming to keep it neat. The flowers are pure white, borne in racemes, and though we have many white blooming hardy shrubs in May, this has a character peculiarly its own, and should have a prominent place in every garden.

—Hannah More was a cautioning precision sometimes and said many things more pious than she talks about.

"Fell Luxury! more perilous to youth

Than storms or quicksands, poverty or chains."

When luxury and health, however, are synonymous, as in the case of the use of B. T. Babbitt's Toilet Soap, even she would make an exception. In this toilet soap you can get the purest as well as the most pleasant and comfortable in use.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

### MATTERS ABROAD.

AN interest in setters led me to attend the International Dog Show at Manchester, held at the Royal Pomona Palace, on July 20, 21, 23 and 24, under the very excellent management of Mr. John Douglas, to whose courtesy I was indebted for a pleasant acquaintance with a number of prominent sportsmen who have become known to Americans by their interest in dogs. Among these were Wm. Lord, Esq.; Mr. S. E. Shirley, M. P., President of the London Kennel Club; Rev. J. Cumming Macdonna, and G. de Landoc Macdonna, Esq., and Prince Albert Salms of Prussia, whose kennels are quite the most extensive, and best bred of any in Europe, and whose patronage of dogs is tending to foster on the Continent that rapid increase of attention to their breeding which is so marked in America.

The Manchester show in size and importance falls below those held annually at Birmingham and London, and yet its decided success this year was marked by the entry of the large number of dogs. There were no representatives from the kennel of Messrs. Llewellyn, Cumington, Barclay Field or Brevis, and yet there was no lack of dogs, both good and well known. Of those among setters was Mr. Shirley's (formerly Hamming's) Champion Rock, to whom was very justly awarded the first prize in the English setter dog class, and also the cup for the best setter in the show, the second going to Mr. Macdonna's Blue Prince II., and the third to Mr. J. B. Wilson's Bruce, by Laverack's Blue Prince out of Flash. Of bitches in the same class the first place was taken by Fletcher's Dora, while both second and third went to progeny of Laverack's Blue Prince, viz., Wilson's Floss, and J. F. Walton's Doll. Mr. Macdonna's Rover again carried off the honors in the Irish class, while Mr. Shirley won first both in retrievers and fox terriers.

To the hospitality of Rev. J. Cumming Macdonna I was indebted for a day or two of great pleasure at his home at Cheadle Rectory, Cheshire, about six miles from Manchester. Mr. Macdonna is not slow to express his appreciation of the attentions extended to him while in America, and surely they must have been great if they exceeded his courtesies to your correspondent here.

The criticisms visited by some American journals upon a clergyman for giving public expression to his love for so noble an animal and one so important to the comfort of man as the dog, by attending the New York International Bench Show, did not want for English newspapers of a certain (or an uncertain) class, to give them currency, both by quotation and additional comment. It is a rule, as valuable as it is old, that to best judge of a man, you must learn how he is regarded at home, and tried by this test. Mr. Macdonna's censurers will not find him much damaged by their opinions; for, on his return from America, he found his faithful parishioners in full force at the Rectory, with a brass band to tender him a serenade and a warm welcome home, and thus to let his critics learn how much those who knew him best, thought of him and how little of them. Indeed, I could well understand the esteem and affection in which the Cheadle Parishioners hold their Rector when, from his pew in the chancel of the fine old church, at the Sunday service, I could see not only from their large numbers and high character, but as well from their deep interest, how much they owed to Mr. Macdonna's faithful and zealous labors. The church, which is a fine Gothic structure, was originally built in 1320, afterward rebuilt in 1634, and now, under Mr. Macdonna's exertions and supervision, is being restored at a large expense, but one quite easily borne, I should hope, from the wealth of the congregation. It is Mr. Macdonna's ambition that Cheadle Church, when its restoration is completed, shall be the chief object of attraction to the visitor at Manchester. The Rectory itself is full of interest. It's a large mansion, of considerable age, and built at various periods, with a spacious dining-hall, studded with heavy oak-panels—black with time. In this room is an oaken mantel, a part of the spoil of Furness Abbey, made probably in the 15th century, very high and wide, and most richly carved with that perfection of art only to be found in England, until more recent times, in the Ecclesiastical architecture and ornamentation. Extensive gardens and lawn with shade trees, and that turf which is the despair of Americans, complete a picture of domestic comfort and beauty, which it seems that England almost only can produce.

Prince Salms, whom I found also a guest under the hospitable roof of the Rectory, desires to secure the establishment of a truly international show of dogs, at some point on the Continent, at once convenient of access, and where abundant accommodation can be furnished, as, for instance, Baden-Baden—and which shall secure the largest competition from the Continent and England, and, if possible, America, also.

Distance, however, would probably preclude any large participation from America in such an exhibition, although if our importation from this side of the best dogs continues at its present rate, we will soon reach a point of excellence in breeding when we need not fear the result, if, indeed, it has not been reached already.

Manchester, Eng., Aug. 8th, 1877.

AMERICAN.

—The dog tax collected in Crawford county, Pa., this year won't pay for the sheep killed, and the Commissioners will levy a special tax.

RED AND WHITE IRISH SETTER NED.

NED.—Ned, by Bailey's Shot, out of Wilkinson's Frank, Shot by an imported dog (name unknown), Frank from English woodcock strain. In color Ned is a beautiful red and white, and is marked very sharp; of medium size, and was whelped June, 1871. He received the ROD AND GUN premium, also special premium, at the bench show at Springfield, in 1875; and the gold whistle awarded at the Bench Show in the same city, in 1876.

### THE COLUMBUS KENNEL CLUB POINTERS.

EDITOR FOREST AND STREAM:

Although much has been written about the setter kennels of our country in FOREST AND STREAM AND ROD AND GUN, no mention has ever been made of the kennels in which the breeding and rearing of pointer dogs is made a specialty. Perhaps a brief sketch of our kennel may stimulate others to follow suit as to the kennels in their neighborhood, and thus assist in keeping up the lately re-aroused interest in the not long ago almost lost sight of pointer.

The stalls of the Columbus Kennel Club building measure on the ground floor 4 by 9 ft., except that for whelps, which is 7 by 9 ft. and 8 ft. in height; are roomy, well lighted and ventilated, and open into a good-sized exercise yard.

The club owns seventeen pointer dogs, only four of which are kept kennelled for breeding purposes. Of the four we must first mention Champion Belle, who is well deserving of the honor, if only for her winnings. She is liver and white ticked, "symmetrical and beautiful, with general appearance racy." Her head is of fine size, and her nose is square and rectangular tipped; her ears thin in leather, set well back in the head, hanging close to the cheeks; she has a well pronounced stop, a fair forehead, good eyes and large nostrils—in other words she is an Idstone's ideal. She was never beaten upon the bench but once, and then she was in no show form. She took the first prize at Chicago, Baltimore and Philadelphia, and champion in the champion class at New York City.

Second stands Fan, better known as Gillespie's black Fan, a jet black gyp, with a little white on neck, and breast ticked with black; having immense quality and endurance. She took first at Chicago and a first and special prize with her two three-months-old pups, Black Prince and Black Countess, at Baltimore. She produced in one litter four first prize winners, viz.: Prince, Fleet, Countess and Princess. Fan was brought to this country by a gentleman coming from England to reside here, and her fame became so great that the club determined to own her, and finally accomplished their object. Some object to her fineness; but if all resemble this one the finer we breed our pointers the better, for she refuses neither briars nor water, and we have yet to see her tire.

Shot, the stock dog, is a large, powerful animal, but not weighed down with lumber. In color, white, with slight chestnut markings on head and ears. He has the longest nose we ever saw on a dog of his size, and its flues resemble good sized rifle bores, easily accounting for his unsurpassed olfactory powers. His get is fine, all bearing his impress. He took first prize at Detroit, and if it were not for his disfigured caudal appendage, would take first prize at almost any bench show.

Last comes Fannie, formerly known as Price's Fannie, who has always been so busy in the field and far away from home that she never could be shown. She is direct from the Royal Kennels, a gift from the Prince of Wales. In color she is white, with evenly marked orange head and ears, and a spot or two of orange on the back. In build she resembles somewhat the Spanish dog, but does not carry his amount of timber, and excels him in fineness. She is a persistent worker,

carrying a high head, quartering her ground regularly, staunch on her point, and having been worked upon all kinds of game she is as near perfection as breaking and use can make any dog.

BOURGEOIS.

RUSSIAN SETTERS AND CLUMBER SPANIELS.—In the FOREST AND STREAM of August 16th, I was pleased to meet with a letter from our friend Amicus Canium, touching upon Russian setters, a breed that I have so often heard discussed but never have had the good fortune to meet—in its purity. Indeed some cavaliers question the fact of its existence as a distinctive strain at all.

In his latest work on "The Dog," Idstone says: "I have heard of Russian setters, but I have never seen one worthy of that name, nor do I think that such an animal is bred or cultivated by the Muscovites; at any rate I shall not be able to say much more of him or his performance than the late Mr. Lang, of Cochin street, whose account of some he once possessed has been quoted by so many authorities, that it must be well known to all who take any interest in the gun—but I believe he subsequently modified his opinion of them."

It will be seen that Idstone is careful not to indorse Mr. Lang's opinion, but called attention to the subsequent modification of the views of this breeder in respect to them.

I hope that now the question has been mooted in your columns it will draw out full and free correspondence from all sides.

Amicus Veritatis, in his letter (to which Amicus Canium refers) championed the cause of the Clumber Spaniel, and I expect will have something to say for the breed in answer to the article on "Dogs for Close Cover," for certainly it is the best and purest of the field spaniels now existing, the handsomest if not the most useful of them all. Like good wine, he improves with age and adds to his knowledge from experience, so that when your setter or pointer is *hors du combat* he is in his prime. The breed, unfortunately, is but little known in this country; but, as I learn that there are good specimens here now, I hope to see that plodding, sturdy fellow come into more general use. There are many sections of our country where he would be invaluable.

In the recent dog shows through the land, some of which I attended, I do not remember to have seen a Clumber nor a class allotted to him; perhaps had a class been assigned more might have been brought out than are generally supposed to be among us.

CANIS MAJOR.

RUSSIAN SETTER.—In FOREST AND STREAM of Aug. 16th, "Amicus Canium," in his paper on Russian setters, quotes Frank Forester as never having seen a Russian setter. Now, Mr. Editor, will you please to give your understanding of the following sentences—of which A. C.'s quotation, "I have never seen a pure one," is a part—taken from his Manual and Field Sports? "His color is black, black and white, or pale lemon and white; I never saw one of any other color. I have never seen a pure one—though I once owned a half-breed, a most superior animal—in America, nor are they common or easily attainable in England. I learned to shoot over one in England \* \* \* and almost everything that I know of shooting that old Russian taught me."

It makes an admirable retriever, and would, I think, suit this country beyond any dog with which I am acquainted, though I have never seen one in America. \* \* \* The Duke of Devonshire had, when I was in England, and I believe keeps to this day, this fine variety in its purity; and in my boyhood my father, the late Dean of Manchester, had some excellent dogs of the Russian breed, one of which, Charon, was the best dog, far or near, over which I have ever drawn trigger.

Could not Lieutenant Ismailoff, of the Orloff Trotters, be approached as to whether Russia has a distinct variety of setters? Idstone has pronounced all Russian setters myths. Why should A. C. appeal to him?

Columbus, Ohio, Aug., 21, 1877.

BOURGEOIS.

[That Frank Forester never saw a Russian setter, "pure and undefiled," is evident from his own admission. What more can be said? It is extremely doubtful if there be a pure-bred Russian in all Great Britain, the dog carrying the name being a cross between the Russian and English breeds. Charon was one of these cross-bred dogs. Even in Russia and Finland they are rare, and it is a mooted question whether there can be found a Russian setter of pure strain.—Ed.]

**A JEALOUS SKYE TERRIER.**—The following remarkable instance of jealousy and revenge, exhibited by a Skye terrier, is narrated by a distinguished Scotch lady in a work privately printed some years ago: "We had," says the lady in question, "a Skye terrier named Oscar, which had a particular affection for Nanny, the dairy-maid, and always accompanied her to the milking of the cows, for which attention she rewarded him with a basin of warm milk. He always went with her to her father's house at Linlathen on the Sunday evenings, a distance of two miles, after having been to the established church at Muirros, but on the occasion of the opening of the Free Church in the parish of Monifieth, which is not far from the dwelling of Nanny's parents, he went there alone, remained in the tent during the forenoon service, was observed among the congregation in the new building in the afternoon, and we suppose he must have remained till the evening service, as he did not appear at home till past eleven o'clock at night, when he gave tongue at the window of the maid's room. Once or twice after this Nanny had inadvertently gone from home without him, and he had observed her caressing some strange dogs on the road, which threw him into such a paroxysm of jealousy that he nearly demolished her wardrobe. He went to the room where she and the other maid-servants kept their clothes, drew two of her best caps from a basket, carried them down stairs, and hid them among some shavings in the stick-house. Being unable to extract the straw bonnet from the basket, he chewed the strings of it, and tore up a handkerchief, and finished off by selecting a printed gown of hers from among those of her fellow-servants, and tore it to shreds. Great was poor Nanny's consternation when she discovered that the creature whom she always said 'had mair wit than many bodies' should be guilty of such misconduct, so she gave him a good thrashing, and he vanished from the house. No one saw him again for a couple of days, Nanny looking very mysterious all the time, and feeling assured that he had 'over muckle wit.' The first intimation I received of his delinquency," adds the lady, "was from himself, when he came creeping to my feet, and looking into my face, as if entreating forgiveness. He did not go to the byre with Nanny for more than a week after this, but, on mature deliberation, he made an advance to lick her hands, and she restored him to favor."—*Ed.*

—Mr. John E. Develin imported red Irish setter bitch Mollie, full sister to Moya, and first prize winner at the New York Bench Show of May, 1877, for imported red Irish setter brood bitches, gave birth to eight puppies, August 1st, at the kennel of David G. Hartt, Northport, Long Island. The brood contains five dogs and three gyps, which are by Rufus, who was also a first prize winner at the Bench Show. [See advertisement.]

**BUTLER ON THE DOG.**—A fifth edition, illustrated, of this work has just been issued by D. S. Holmes & Co., of Brooklyn. Price \$2.00.

—The managers of the Louisville Industrial Exposition are arranging for a bench show of dogs during the last week of the Exposition.

—St. Louis is to have a Bench Show in October, when \$1,000 will be distributed in prizes.

**BONA CANIS OBITA.**—Mr. Wm. H. Balcom, of Worcester, Mass., has lost his highly-prized setter Peg, valued at \$500.

—Mr. F. O. de Luze, Spratt's agent, has just received a fresh lot of biscuits.

**MUSIC HALL DOG SHOW.**—The classes of this interesting entertainment, to which the public of Boston and vicinity are to be treated for a short time, are nearly filled.

Through the extra exertions of the management, a large number of dogs, both useful and ornamental, will be offered to the public eye. Many of the canine pets will be objects of attraction, and although there will not be so many hunters or sporting dogs, as in former shows held in other cities, there will be much to attract and interest the visitor. Most of the pets are owned by people who have shown great interest in assisting the managers by their prompt entries, and altogether we look for a grand affair. W. S. N.

## Sea and River Fishing.

### FISH IN SEASON IN AUGUST.

| FRESH WATER.                               | SALT WATER.                                      |
|--|--|
| Trout, <i>Salmo fontinalis</i> .           | Sea Bass, <i>Selenops ocellatus</i> .            |
| Salmon, <i>Salmo salar</i> .               | Sheepshead, <i>Archosargus probatocephalus</i> . |
| Salmon Trout, <i>Salmo confluens</i> .     | Striped Bass, <i>Morone tinnatus</i> .           |
| Land-locked Salmon, <i>Salmo gloveri</i> . | White Perch, <i>Morone americana</i> .           |
| Grayling, <i>Thymallus tricolor</i> .      | Weakfish, <i>Cynoscion regalis</i> .             |
| Black Bass, <i>Micropterus salmoides</i> . | Bluefish, <i>Pomatomus saltatrix</i> .           |
| M. nigricans.                              | Spanish Mackerel, <i>Cybitum maculatum</i> .     |
| Mascalouge, <i>Esox nobilior</i> .         | Cero, <i>Cybitum regale</i> .                    |
| Pike or Pickerel, <i>Esox lucius</i> .     | Bonito, <i>Sarda pelagica</i> .                  |
| Yellow Perch, <i>Perca flavescens</i> .    | Kingfish, <i>Meristichius nebulosus</i> .        |

**FISH IN MARKET.**—The novelty in Fulton Market this week is an installment of very fine green smelts from Bathurst, New Brunswick. These fish are packed in snow and moss and shipped per fast express to Mr. Blackford's market, where they arrive in perfect condition with their peculiar and delicious cucumber flavor unimpaired. Bluefish and Spanish mackerel from the Long Island coast are plentiful. Our quotations for the week are as follows:

Striped bass, 18 to 25 cents per pound; smelts, 20 cents; bluefish, 8 to 10 cents; salmon, frozen, 30 cents; mackerel, 15 to 35 cents; weakfish, 12 cents; Spanish mackerel, 20 cents; green turtle, 15 cents; halibut, 15 cents; black-dock, 8 cents; king-fish, 25 cents; codfish, 8 cents; black-fish, 15 cents; flounders, 8 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 8 cents; soft clams, 30 to 60 cents per 100; Long Island trout, 75 cents; Salmon do., 15 cents; Canada do., 30 cents; sheepshead, 20 cents; whitefish, 15 cents; hard shell crabs, \$3 per 100; soft crabs, \$1.25 or dozen; frog's legs 85 cents per pound.

## RIO GRANDE TROUT.

CIMARRON, New Mexico, Aug. 8, 1877.

### EDITOR FOREST AND STREAM:

From the allusion to this fish in your issue of July 26, I am led to infer that the general information in regard to it is so meagre that a few notes on its occurrence and habits may not be without interest. The Rio Grande trout, the *Salmo pleuriticus* of Cope, is found in all the mountain streams of Southern Colorado and New Mexico, the finest fishing being generally found in the head-waters, in the parks which lie on either side of the main ranges of the Rocky Mountains, at an elevation of from 7,000 to 9,000 feet above the sea. In some of these beautiful basins, nestling at the base of snow-capped peaks, 13,000 feet or more in height, one can find during the months of summer and autumn, a combination of magnificent mountain scenery, exhilarating climate and fine fishing, not excelled anywhere. This species is undoubtedly one of the handsomest, as well as gamiest, of its kind. I have taken it in many different streams in this region, and find some variation in its specific characters. I have recognized two rather well-marked varieties which are distinguished by the color of the skin on the belly. In one it is yellowish white, with scarcely a trace of red about the fins and head, and in the other a brilliant deep pink. This difference is not due to age, as it is observed among all sizes. The spots in all are black, and vary greatly in number, but they are generally numerous, arranged in longitudinal rows along the whole length of the body and covering the caudal fin. But a few days ago I took one about eight inches long with very few spots, and those distributed only on the anterior half of the body, the tail and rear half of the body being entirely free from them. There is also a difference in the flesh of these trout. In some it is a pure white; in others it assumes an elegant pink or salmon color. The latter are by far the finest for the table, possessing a firmness and flavor not found in the others; but the color of the flesh does not correspond to the outer markings, for those with pink flesh invariably, so far as my observation goes, have white skins. The white skinned fish do not always have pink flesh, however, nor am I able to affirm positively that none of the red bellied ones have it, though I have not so far observed it in them.

It is a voracious fish when in the humor, and will take almost any kind of bait, though like its congeners it is capricious in its appetite and will at times display a most unaccountable indifference to the most tempting lures. Angle worms are generally good, and also grasshoppers; at times they rise eagerly to the fly, and when they do the sport is superb in the larger streams. Hackles are by all odds the best flies, as they keep their shape better in the very swift streams. The winged grasshopper, or locust, is perhaps the most killing bait for real sport. Used with light tackle and without sinker you have all the excitement of fly fishing, while you are much surer of your fish in small brush-lined streams where there is little chance for a good cast or accurate strike. Sometimes, however, they will not take even this attractive bait. Indeed, I once fished one of our finest streams for nearly a week in September, where the trout were numerous and little disturbed, and they would not take grasshoppers nor artificial flies, save sparingly in the afternoon. But the eyes when floated on the ripples and sunk three or four inches in the pools and eddies at the foot of ripples proved attractive, and were the means of capturing several hundred. At times these trout are very wary and must be approached with great caution, or the angler gets no fish. The native Mexicans who fish with sinker and bait, large hooks and short lines, and who often thus take large numbers in the winter, prefer to have the stream a little muddy, as they say the fish bite better. The reason is apparent. Sometimes, however, the rapacity of the trout renders them oblivious of all danger, and they will take the hook time after time until landed. The fish commonly taken here average seven to eight inches in length, though as one becomes familiar with their habits he can capture enough of the old fellows to raise this average considerably. The heaviest I have taken is about a pound and three-quarters, though they are reported to be four and five pounds in San Juan River.

I had some excellent sport recently at the head-waters of the Vermejo, in this county, when a friend and myself took, in three half days fishing, near three hundred, among which were twenty odd weighing considerably over a pound each. Generally these large fish were shy, and required careful approach and sometimes patience, if not hooked at the first rise. There were some cases, however, illustrating the extreme of boldness. For instance, in fishing along where the stream was twenty feet wide or less, and a beach on one side without any cover or bank for concealment, the opposite bank being some two feet above the water with a little grass overhanging, and casting from the unprotected side, my friend struck a heavy fish, which got off, however. Immediately he took the bait again—a floating grasshopper—and kept it, hook and all, being lifted two or three feet out of water in the struggle. I then came up and could plainly see the fish lying under the opposite bank six or eight inches below the surface. We fished for him together, and within five minutes he was hooked no less than three more times and raised to the surface, but escaped each time. All this time, he it remembered, we stood on a level beach in plain sight; he then disappeared and we passed on down the stream. On returning a half an hour later I discovered him again in the same spot. My first cast frightened him apparently, but he at once returned, and when the next time the grasshopper, with his pink and white wings spread and fluttering, was carefully dropped just above him, he turned, and with one deliberate motion seized and swallowed it. A quick turn of the wrist fastened the bait in his gills, and he

started down stream toward some roots and snags with a speed and strength that made the reel buzz. Checking him rather quickly I lifted him on to the pebbly beach before he could recover for another rush. He was a beauty, fifteen inches long, and weighing no doubt, when taken out of the water, two pounds. He had the hook, which he had before taken, clear down in his stomach, having by some means got it free from the gills and gorged it.

Within a hundred yards of the same place and just before capturing the last fish I had an example of the opposite disposition. I was carefully approaching a bush standing beside a rather large pool of still water above a beaver dam, when I saw a dark brown object rise slowly to the surface and lie there. I stopped and watched it, puzzled by its singular appearance and action, and in a little while it sank as slowly and mysteriously as it had arisen. Seeing it imperfectly, I thought it must be some kind of water-snake, or strange monster new to me. Reaching the bank under the friendly shelter of the bush, I watched and soon it appeared again in another place rising slowly and vertically until it rested on the surface, when its head and fins revealed the presence of a very large and very dark colored trout. Instantly my bait was lightly dropped in front of him, which he surveyed a few seconds and disappeared. Six or eight times he rose and sank in this manner, never appearing to be in search of food or anything else, but displaying the same lazy indifference to grasshoppers, the eyes and fins of his fellows, and the most tempting casts of flies. He would take nothing, and I had to leave him, only regretting that I could not take time to try him at sun-down, when a better appetite might have instilled a little more life and energy into him, and at the same time alas! proved his ruin. When railroads render this region better known, many sportsmen will pronounce these streams equal to any elsewhere for the taking of this splendid fish. APACHE.

**SPORT IN EASTERN CONNECTICUT.**—*Norwich, Conn., Aug. 24, 1877.*—Our city, situated at the head of tide-water on the Thames, at the junction of the Yantic and Shetucket Rivers, is located in the midst of what is naturally a great game district. Fresh-water fishing is the order of the day at present. In the spring we had very fair trouting early in the season, if one could find a brook that had not been fished. Our county is fairly lined with good, natural trout streams, but the fish have been pursued incessantly in and out of season almost to extermination. Some good catches were made early in the season, but later it was difficult to find a trout. One pound is as large as most streams show. July 1st our black bass season opened. The Shetucket and Quinebaug Rivers are well stocked with bass; they are caught as high up as Williamantic, fifteen miles on the Shetucket, and at Jewett City, eight miles up the Quinebaug. Five pounds is the largest fish I have heard of. Strings of twenty to forty have been caught. One party of four claim ninety; another, one hundred and twenty. Gardner's Lake, a beautiful sheet of water seven miles west, is stocked with bass, though no very large catches are made. The writer took one of one and a half pounds, trolling with spoon, and a friend caught a three-pounder. For bait dobson is the favorite, as that catches the large fish, though worms are full as taking for the small ones. Our motto, however, is quality rather than quantity. Have tried fly fishing unsuccessfully, though bass have been taken in the river with the fly. We find the bass a very uncertain fish, one day taking the bait readily, and the next every enticement failing to secure even a nibble. In taking the bait they are fully as wary, if not more so than the trout, though the writer found a notable exception a few days since—was fishing with "dobs" with a nine-ounce bamboo rod, and making a very long cast to reach a certain pool. The dob is lively, and its special aim seems to be to get your line fast on bottom. I had a strike and commenced reeling in, but fetched up and, concluding my strike was the dob under a stone, I finally cleared by parting my line, leaving leader and hook behind. Had scarcely got another hook and bait into the water when a fish had it, and I landed a half-pound bass. I found stuck down his throat my lost hook and dob, and four feet of gut leader hanging from his mouth, and both hooks were fast. Our greatest difficulty here is to get dobson. They cost from \$3 to \$5 a hundred, and those who have the secret of finding them keep it well. UNCAR.

**LAKE ERIE BASS FISHING.**—H. came into the office last May with glowing reports of the fishing at Kelly's Island which awakened all my enthusiasm, and believing that business could last forever, and bass fishing but for a brief season, I concluded to seize the opportunity, and with a party took the evening train for Sandusky. After a fair night's sleep upon the road we found ourselves listening to reports by railroad employes of the wonderful fishing at the Island. We marched down to the Myrtle, a fast steam passenger tug plying to the Island, whose captain told us that bait was scarce, and consented to wait for us, while the desired material was procured. The captain kept the donkey engine running all the way to keep our bait in fresh water, as the day was hot and nothing else would keep them alive.

An hour's ride brought us to the Island. We put our minnows into the tanks at the capacious boat-house, and Jacob Rush at the "Island House" found rooms for us. Dinner over, boats and oarsmen were selected, tackle rigged, and off we started, some to North, some to South and some to East Bay. South Bay is a very good fishing ground in sight of the hotel, and directly in its front.

At night we compared notes and fish, and were most of us somewhat disappointed with the sport. The afternoon had been still and hot, the bass were sluggish and showed no fight; still we caught twenty fish each averaging in weight two pounds. The little show of fight was discouraging; as one who tried it said he "would as lief fish with a hand-line for cod as for such bass."

At supper the house filled, and pleasant surprises met us. There were fishermen whom we had met on the shores of inland streams, in the ocean surf and in the wilds of the North Shore. The result was the usual marvelous tales of salmon, striped bass and trout—successes and failures, with an occasional reference to the black bass. Indeed, some fishermen told larger stories of the last than of any of the others. Nor did the day's fishing suffer in the telling: How one boat (with an oarsman and two fishermen) had brought in one hundred and fifty bass; how another had one hundred and ninety, and so on until one reached two hundred and ten. This made our little catch of forty per boat sound small.

Next morning an early start was made, at which hour fishing with a fair breeze gave us better sport; but while the number of fish taken was not proportionately greater than the day before, there were larger fish, reaching, some of them, four and a half pounds, and the catch (counting out a few "croppies," or "speckled" bass as the boatmen termed them) averaged about three pounds each. The boat average for the

day was sixty-two. The sport was fine, and the fish fought bravely, some of the larger ones only being taken after a sharp tussle of fifteen or twenty minutes, which, with light tackle, made very exciting sport.

But at night, gathered about the porches of the Island House, we heard big stories of the day's successes from others; catches of from one hundred and fifty to two hundred and thirty-five per boat. We noticed, however, the catches, though large in numbers, were not remarkable for weight, few being reported at over three pounds, while averages went as low as one pound. But the big catches were mysterious, and we concluded there was some secret about it we had not fathomed. One boatman said—but boatmen are not all strict truth-tellers—that hand lines were used, and three or four hooks on a line, and all the other devices a pot fisherman knew how to avail himself of. We found, on looking at the rods in the office, that to many lines were attached above the minnow hook bright flies, and, upon inquiry, found that at that season, while bass never took flies on the surface or even ordinarily under the surface, yet, when an active one was hooked at the minnow and was darting frantically around, he would sweep through the water in such a way that others would start in his wake and snap at the flies. Judging from our experience with trout, there might be something in this, but we did not try it.

The third day an attempt was made by some of the unbelievers in big catches by fair means to solve the problem. Two Cincinnati gentlemen had made the biggest catches, day after day; they had the biggest and best boat and took two carmen, one being employed while fishing in baiting hooks and landing fish. This would give them considerable advantage of course, but not enough to account for their wonderful luck. So at least many thought, and this day two other gentlemen from the same city determined to see how it was done. All started out together, and the doubters gave their boatman instructions to keep always in sight of the big boat. The watch was kept all day, but nothing unusual was seen, and at supper all came together again. No one had been quite as successful as the day before, but our envied friends from Cincinnati, the heroes of the wonderful catches of the last five days, came in with the smallest lot of any. It is fair to say that while no "pumping" (hand-line or dipsey fishing) was proved against them, the general belief was, that had not their friends been so socially inclined the catch of that day would have shown a larger score. It is not to be disputed that some men in their anxiety to make big counts resort to means such as gentlemen who fish for recreation scorn to avail themselves of. Against the means used by a man who fishes to make a living, when used in the proper season nothing can be said, but such are not often used by gentlemen. A sportsman with decent instincts would no more fish with half a dozen hand-lines for bass, than he would seine trout, shoot a covey of fledgling quails on the ground, or use a swivel-gun on ducks.

One method resorted to at the Island was new to me. When the frequent bites gave indications of a school of bass a light pine stick for a float attached to a line having a half pound lead-sinker at the other end, would be thrown out, so the float formed a buoy around which the boatmen would pull, so as to keep within the school. It was seldom, however, that any large fish were caught from schools. From two pounds down were the ordinary sizes.

We started home the following morning carrying most of our fish packed in ice. Mr. Rush has boxes at his boat-house where fish can be kept as long as one desires, and his men pack in ice and ship at very reasonable charges. Everything is well and fairly conducted, and we should have to go far to find a better place for spring and fall fishing. Fishing commences about the middle of September and remains good for several weeks. This is better than spring fishing, and if any of the readers of FOREST AND STREAM are inclined to it a line or telegram to Jacob Rush, Kelley's Island, will meet with a prompt response. One word, in buying your minnows at the boat-house overlook the counting. We never knew it to fail that if one wanted a hundred minnows the count would come out just right from a draw in the tank, although a subsequent count of the contents of the bucket would ordinarily show a deficiency of from eighteen to forty one. In fact even greater deficiencies were charged.

THOSE YOUNG SHAD.—In your issue of Aug. 16th, in speaking of young shad caught near Washington Market, I gave the length of one as five inches and seven-eighths and the other a trifle less. For free read *three* and it will be as I intended, for certainly it is not remarkable to see a year old shad five inches long, as that is about the usual size. A correspondent asks how I know that they were shad, and to state in FOREST AND STREAM how to tell a young shad from a herring or alewife with certainty, and this is the way of it: It is not difficult to tell the family *Clupeidae* by the single dorsal, large deciduous scales, compressed sides and its serrated abdomen, or saw belly; but the species when young, like all immature specimens, are hard to determine in proportion to their immaturity. The size and shape of the sub-orbital bone or large bony scale immediately below the eye is, I think, the surest.

In the shad this is long, or rather deep, and has the lower angle moderately acute, while the river-herring or alewife has it comparatively short and the lower margin rounded. This is very plain in the adult fishes, and the difference could be distinctly seen in my three-inch specimens, hence I call them shad, and think them small for yearlings. I have never seen anything that I knew to be an adult hybrid between the fishes named, although I know positively of great numbers being hatched and turned out in the Hudson. As these hybrids were always sired by the alewife, *Pomolobus pseudoharengus*, it is not unlikely that there may be a uniformity in their appearance and a resemblance to either parent. I have often looked over the shad and herring at Mr. Blackford's in Fulton Market with an eye to this cross, but without result.

FRED MATHER.

MAINE.—The bays of Maine in the vicinity of Portland are full of mackerel, due, as the old fishermen say, to the fact that the sharks outside are numerous and have driven them in.

BIG FISH.—At a family gathering at the residence of Capt. Fish, in Falmouth, Me., a few days since, there were present seven ladies whose aggregate weight was over 1,500.

MASSACHUSETTS.—South Hadley Falls.—The dispute as to who first caught shad in the Connecticut River with hook and line, has been settled in favor of F. C. Bardwell, of this place, who has made affidavit before a justice of the peace that he took three shad with the hook and line, August 15th, 1869.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals at this port the past week has been 72, as follows: Banks, 12; Georges, 39; Shore mackereling trips, 21. The receipts of fresh halibut have been very small—55,000 lbs. from the Banks and 15,000 lbs. from Georges, and prices have ruled high, the last sales being at 9 and 5 cts. per lb. for Georges. Codfish have been in fair receipt, 1,180,000 lbs. Banks and 585,000 lbs. Georges, but the weather is unfavorable for curing in large lots, and prices are well sustained, though ruling considerably below the prices at this season last year. But little is doing in mackerel, most of the Shore fleet coming in light. There have been no arrivals from the Bay, but two vessels are on the way home and daily expected.—Cape Ann Advertiser, Aug. 24.

Martha's Vineyard, Aug. 24.—A shark weighing 1,200 pounds was caught off Gay Head on Monday.

Gloucester, Mass., Aug. 24.—The schooner Grand Master, which left here March 20th for the Grand Banks, came into port last Friday, having 270,770 pounds of codfish, the largest Grand Bank catch ever brought into this port.

Rhode Island—Warren, Aug. 26.—Bluefish have appeared and are beginning to bite.

CONNECTICUT—East Hampton, Aug. 21.—Mr. Wm. G. Buell, a veteran sportsman, now the proprietor of the Pokapung House writes of Lake Pokatopaug: "The name, which is Indian, signifies Clear Water Pond. It is a beautiful body of water containing nearly nine hundred acres, and having in the centre an island covered with the original timber. The lake is well stocked with black bass, pickerel and all the smaller fresh-water fish. I have in three seasons put into the lake 20,000 land-locked salmon, and hope to live to take some of them. I am now sixty-three, and love the dog and gun as well as I ever did.

Deep River.—Mr. Gustavus Pratt killed a large water snake on Saturday, 18th inst., at N. B. Pratt's mill pond. Upon killing him he observed the extreme end of the tail of a fish sticking from his mouth, which upon investigation proved to be a pickerel eleven inches long. Whether the snake charmed the fish or caught him napping is unknown, but anyhow he exercised the serpent's wisdom in swallowing him head first.

NEW YORK—Tribe's Hill, Aug. 21.—A black bass weighing six pounds was caught in the Mohawk to-day by Lew. Eberhard, of C. R. R. freight engine 237.

Rochester.—One of the City Assessors recently captured in Braddock's Bay eleven pickerel and one very large Oswego bass. The pickerel he gave away, reserving for his own table the bass. "But when the fish came to be prepared for cooking a wonder came to light that spoiled all hopes of dining off that fish, but taught a lesson in natural history and the survival of the fittest. A young muskrat, weighing upward of half a pound, was found in the fish's stomach, of which the creature had made a lunch before he took dinner on the spoon hook."

NEW JERSEY—Forked River, Aug. 20.—The large blue fish are now being caught in considerable numbers, the boats coming in to-day having from 30 to 90, averaging 10 lbs. each. The weak fishing has also been very good the past week, 40 to 60 a boat, weighing from 1 to 3 lbs. each. There have also been quite a number of sea bass and black fish caught, but no sheephead of any consequence. We look for good fishing of all kinds from this time forward.

Kinsey's Ashley House, Barnegat Inlet, Aug. 24.—Immense schools of bluefish, running from 10 to 14 pounds, put in an appearance on the 19th. Captain Bunnell and party, 80 bluefish; Captain T. Potter & Co., 91; Captain T. Predmore and party, 92; Captain Wm. Predmore and party, 90; T. Taylor's yacht, with party, 86. 25th, 32 yachts took on an estimate 7,000 pounds; 26th, bar rough; none out. Yacht Mystery, from Long Island, arrived with some 40 bluefish and Spanish mackerel.

PENNSYLVANIA—Bristol, Aug. 23.—Rock fish are caught from the wharves. Sturgeon roe is the best bait.

Harrisburg, Pa., Aug. 25.—Bass are tolerably plenty hereabout, and could be caught readily at almost any part but for the hundreds of "outlines" stretched across the river.

The largest fish seen this year was one caught by Mr. Arnold, while fishing sixteen miles above the city, which weighed 44 pounds. It was caught from the top of Green's Dam (Clark's Ferry), and lifted out of the "re-action" water a distance of eight feet and safely landed in his boat. The party that was fishing with Arnold took one 3 and several 2½ pounds, as well as smaller ones.

Respectfully,

BASS-O-BAZOOK.

Middletown, Pa., Aug. 23.—Bass fishing in the Susquehanna has been very poor the last week or two. On Thursday, the 9th, I caught five that weighed nine pounds and a half, the heaviest three and a half. Bass are very plenty in the river, and may be seen running the small fish any time in the day. In three days' fishing I caught eighteen the first, fourteen the second and eight the third.

VIRGINIA—Leesburg, Aug. 21.—Bass fishing is better above and below this point than it is here. Five or six pounds to the angler has been about the average. One four-pounder was taken with minnow, and a good many over two pounds with fly and with minnow. Our small brooks begin to yield bass of good size, fish of nearly two pounds have been taken in streamlets ten or twelve feet wide.

T. W.

FLORIDA—St. Augustine, Aug. 24.—Trout are biting now and are the principal fish sought for by anglers.

WISCONSIN—Ashland, Aug. 18.—Capt. W. W. Rich, yesterday visited Fish Creek, and returned with sixty-six beautiful trout, which aggregated twenty-five pounds.

MICHIGAN—Ann Arbor, Aug. 20.—Wat. Park returned from the North Woods last week, where he has been catching members of the finny tribe. He brought back about thirty pounds of the speckled beauties.

NATURALIST.

Albena, Mich., Aug. 21.—Charley Luce, and G. W. Hawkins went out to Long Lake fishing last Saturday, and by actual time they caught forty-three black bass, weighing in the aggregate 133 lbs.

Detroit, Mich., Aug. 25.—Mrs. Harry Crawford, of this city, while spending a few days at Orchard Lake caught, on the 22d, 82 black bass. On the 21st inst. Don. M. Dickinson and E. O. Durfee were at St. Clair Flats for a few hours sport with the finny tribe, and made a string of 20 black bass. On the 22d inst. Geo. Chandler, of Lansing, caught 32, and Geo. Wheeler and E. O. Durfee, of Detroit, 25 black bass, 14

perch. Stephen Warner and C. Flemming, in six days' fishing at the flats last week, caught 115 black bass, 20 perch and 4 pickerel. Count Von Klappenburg, of Detroit, spent three days at the same place and caught 70 black bass. A few muskellunge have been caught so far this season as follows, viz.: Captain Molt, 3; H. C. Colburn, 1, and C. Woolcy, 1. The one caught by Mr. Colburn weighed 23 pounds. Fishing has been very poor on the Canada side thus far this season.

ROVER.

ILLINOIS—Kankakee, Aug. 24.—Fishing for pickerel and black and speckled bass very good here this season.

Peoria, Aug. 23.—Bass, jack salmon, red eyes and other fish are found in good numbers at the Narrows, four miles above here.

NEW BRUNSWICK—Campbellton, Aug. 20.—In company with Mr. Brinkley Parker, Government Supervisor of the "Tobacco Road"—that extends from this place into the wilderness toward the St. John's River—I visited Parker's Lake, which is some three miles distant from this village, and the first of the many small lakes that lie along this route. We had good sport. Our fish varied from 1 to 2½ lbs. in weight, and were beautiful specimens of the *Salmo fontinalis*, and very gummy; quite unlike their not far distant relatives the *Salmo canadensis*.

STANSTEAD.

Camp Steuart, August 18, 1877.—Our party of three arrived at fifty-six mile post, thirteen miles beyond McAdam Junction, Tuesday, at about 3 o'clock P. M. Our guide here met us, per agreement, and we at once started across the one and a half mile carry to a tributary of Kilbura Lake. Two trips were made for baggage and supplies; then two trips by canoe, some three miles, brought us about dark to camp. Since our arrival the weather has been unfavorable for sport, raining most of the time, and raising the streams too much for successful fishing. Still, we have taken a number of trout of fair size, the largest weighing 17½ ounces. A large share of the time has been spent in fitting up camp. Toward night yesterday, Superintendent Stewart, of the N. B. & C. Railroad, came into camp loaded with trout and grouse, which he killed while on his way from the 56-mile post.

CORPORAL LOT WARFIELD.

An enterprising fish dealer of Wick, Eng., has found a new use for the carrier-pigeon. Boats which fish at a large oding take the pigeons to sea, and after the catch dispatch them with the intelligence, which is received at home and suitable preparation made long before the vessels arrive.

CLERGYMEN'S FISH STORIES.—"The Pamunky reminded me of a fish story. So I told it to Brother Peterson. It ran this way: A shark came up that river. A citizen saw it, took a sturgeon harpoon, went out in a canoe, and sent the steel barb into the shark. The shark darted. The cord to the harpoon hung in the bow of the boat, and that end of the canoe started under water. The man jumped up to the stern, and leaped back over the rudder to keep the front from dipping. The shark was doing his best, making (say, roughly,) fifty miles an hour. The fisherman could not go forward to unhitch the cord, for the boat would go right under like a mole in a plowed field, but quicker. So the man had to "rare" back, like he was driving a fast horse in a sulky before his sweetheart's house. His neighbors hailed him from the bank, but he hadn't time to talk. They went home and told their wives, and wondered. The boatman on the river shouted at him as he skated by. He was going too fast to answer. The shark turned out of the Pamunky into the York. Capsized in a river three miles wide, and a mad shark close by, was an ugly thought. The man wished he had been from home the day the shark came by his house, and was "regretful" generally. The shark made a wide circle in the York, and returned up the Pamunky, and, nearly opposite the starting point, suddenly stopped, rose to the top—dead. The man was glad. Now, this is not a small story. It is of the Centennial Krupp iron calibre. I watched Brother Peterson. He didn't seem to give any under it as I liked. He took a fresh bite of tobacco and said: 'I know a bigger one.' 'Tell it.' 'I will. In Charleston harbor a fish swallowed the anchor of a schooner, put out, and dragged the vessel under.' 'Oh,' said I, 'that's apocryphal. Mine was a true story. Dr. Leroy M. Lee vouches for it.' Brother Peterson chewed briskly a second or so, and said: 'I heard Bishop Wightman say mine was true.' A schooner against a canoe, a Bishop against a Presiding Elder, the odds were too good, worse than 'eight to seven,' it was no use, 'to attempt Gibraltar with a pocket pistol.' As at Appomattox, 'yielding to superior numbers and overwhelming resources,' I quit."—Christian Advocate, Richmond, Va.

## SPLIT BAMBOO RODS.

To Our Customers and the Public: In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## Rational Pastimes.

### CRICKET.

COLUMBIA VS. STATEN ISLAND—Staten Island, Aug. 22.—A match between the second eleven of the Staten Island Club and the Columbias of Hoboken resulted in the following score:

St. George's, Hoboken, N. J., Aug. 23 and 24.—A match game between the Bachelors and Benedicts resulted in the following scores: Single—First inning, 77; second inning, 14. Married—First inning, 24; second inning, 70.

SCOTTISH-AMERICAN CLUB.—The third of a series of the handicap games of this club was held on their grounds at 829 West Fifty-fourth street, last Saturday. Summary:

Two-Hundred-and-Twenty Yards Run.—The second heat, four contestants, won by T. H. Smith in 26½ s; M. E. More, second, in 26½ s. The first heat, five contestants, won by H. B. Wilson in 27½ s; J. Robertson, second. Third heat won by H. H. Moritz, in 26 s; F. E. Leonardson, second. In the final heat, Wilson was handicapped ten yards by Smith and Moritz. Smith won in 26½ s, Moritz, second. Prize, a silver medal.

Four-mile Walk.—Battles: F. Buckley, C. Connor, J. V. Wolcott. Won by Wolcott in 32m 48½ s, Buckley coming in 34m 17½ s. Prize, a silver medal.

Relief Race.—Each contestant was carried half way around the track, and was then carried by his partner the remainder of the lap. First heat won by H. B. Wilson, J. V. and F. E. Leonardson in 4m 48 s; second heat won by M. E. More and G. McMichael in 4m 42 s; the third by W. H. Griffin and J. B. Hanna, in 4m 43 s; final heat by More and McMichael, in 4m 45 s. Prize, silver medal to each.

NEWPORT.—The Polo Club having entertained the citizens and summer sojourners of this city with an exhibition of lacrosse, played by Canadian Indians, on Aug. 27, have arranged for pallone playing this week. Under their management an athletic meeting of amateurs is set down for Sep. 6th. The games are to be open to members of the N. Y. Athletic Club, all college athletic clubs and the residents of Newport.

—O'Brien, the pedestrian who recently failed in his attempt to walk 600 miles in six days, having completed in that time 420 miles, will repeat the attempt next month.

NEW JERSEY—Long Branch, Aug. 23.—The swimming match between G. H. Wade and James Cunningham was won by Wade. He swam the two and one-fourth miles in forty minutes, and came in on the finish fifteen yards in advance of Cunningham. Wade has been challenged by Coyle of Philadelphia.

SWIMMING AT HARLEM.—The swimming contest under the auspices of the New York Athletic Club, last Saturday, was participated in by eleven contestants: William Childs, Nautilus Boat Club; R. Weissborn, Jersey City Heights; H. W. Peckwell, Dauntless Boat Club; C. M. Shaw, Yonkers Athletic Club; T. E. Kitching, New York; James Fraser, New York Athletic Club; M. Ryan, New York; W. E. Smith, New York; T. B. Bates, Harlem Athletic Club; O. G. Bates, Harlem; and S. Sinclair, a deaf mute from the deaf and dumb institution at Morrisania. The course was from Macomb's Dam to Gates' lumber dock, one mile only. Four of the contestants came in at the finish: Weissborn, 45m. 44½ s; Kitching, 46m. 25s.; Fraser, 49m. 11½ s. Shaw was fourth.

## Answers to Correspondents.

## No Notice Taken of Anonymous Communications.

G. H. E., Rochester.—When does the brook trout season close in Canada? Ans. Sept. 15.

J. G. S., Boston.—In what states will I find good partridge and deer hunting (not too far away, in September and October)? Ans. The Adirondacks, northern New Hampshire and Maine will furnish plenty of sport.

A. H. S., Meshappan, Pa.—Please inform me what kind of bait to use for black bass for month of September and October? Ans. Worms, minnows, dobsen, etc.

R. M. L., Scranton, Pa.—Where, within reasonable distance can I find good general shooting and fishing, with good accommodation for self and family at reasonable rates? Ans. Lackawaxen, Pa. Address J. A. Williamson.

Cohasset, Taunton.—Are there any rules for shooting at glass balls if so, by whom are they published, and what is the price? Ans. Yes. A. H. Bogardus. Can have a set of rules and score-book at this office for twenty cents.

D. C. P., Saratoga Springs, N. Y.—To have your gun choked, send it to Shaffer of Boston, Clark, & Snyder of Baltimore, or any of the gun-makers advertised in our columns.

J. B. E., Williamsport, Pa.—What is the dobsen bait used for bass fishing? Ans. An imitation of the helgramite, or dobsen. See advertisement.

BLACK GEORGE, Mobile, Ala.—Is it not unusual for the *Salmo fontinalis* to be caught in Grand Traverse Bay? Ans. Yes, though the fact of their being found there is not a particularly strange.

R. WOOD, Syracuse, N. Y.—Is there a case on record of a full-blooded Newfoundland dog having the hydrophobia? Ans. Yes, several. No canines are free from the disease.

BELMONT, Bellaire, Ohio.—Please explain in full what the Dobson bait for black bass is? It is new to us out here. Ans. See our advertisement columns. Also page 44 of FOREST AND STREAM, Aug. 2, 1877.

F. M., Bergen Point, N. J.—Where, within twenty-five miles of New York, on New Jersey Central Railroad, can good rabbit shooting be found about Nov. 1? Ans. Monmouth County, back of Keyport or Holmdel.

C. A. R., Clarence, N. Y.—Please advise me of some good place in Canada, near the line, where I can find good fall duck shooting rather early in the season? Ans. St. Clair Flats, twelve hours from Buffalo by rail and boat. Go by way of Detroit or Port Huron.

C. C., New York.—1. Can a Flobertrifle shoot a .22 cartridge? 2. Where can I obtain arrows and arrowheads? 3. 1. By lacking a Flobertrifle to a gunsmith it may be made to shoot a .22 cartridge. 2. At J. M. Marsters, 126 Nassau street, or of Peck & Snyder, 124 Nassau street.

RAYEN, Roedale, Kas.—1. Will you please tell me the charges on a barrel of Bogardus' glass balls by through freight from New York to Kansas City, Mo? 2. The nearest point to get glass balls? 3. Is Mr. Hallock coming out to Kansas on his trip? Ans. 1. Apply to your local freight agent. 2. Can be ordered in St. Louis. 3. No.

TRAPPER, Greenwood, Ill.—I would like to be informed of a good place for trapping and hunting in Wisconsin or Michigan, or any place within four hundred miles of Chicago, where I could make \$30 or \$35 per month above expenses? Ans. On the Sauble or Manistee, in Michigan, or along the line of Wisconsin Central Railroad. Your success will depend entirely upon your abilities.

S. S. J., Baltimore, Md.—Please inform me if there is a work which gives full instructions and positions in long range rifle shooting? If so, by whom published, at what price, and where to be obtained? Ans. Yes, "Long Range Rifle Shooting," by the Rifle Editor of FOREST AND STREAM, just published by us; price 50 cents.

CONSTANT READER, Syracuse, N. Y.—Ans. Watch the turn or, and it increases in size, report, at the same time stating its anatomical situation as closely as possible. The probabilities are that it will dissipate of itself with age.

W. E. R., Cincinnati.—Will you inform me of the changes in the game law of Kentucky? Ans. The close seasons are: Deer, March 1 to Sept. 1; squirrels, 1st of February to 15th of June; rabbits, 1st of February to 20th of October; wild fowl from the 1st of May until the 1st of September; turkeys, 1st of February to 1st of September; woodcock, 1st of February to 15th of August; quail or partridges, ruffed grouse, etc., 1st of February to 20th of October. Insectivorous birds are protected the year throughout.

SOUTH SHORE, Boston.—My setter dog (3 years old) commenced yesterday to evince an almost constant desire to urinate. He would not only do so in the manner common to dogs, but at times would squat down like a very young puppy, and pass a large quantity of urine, and it seemed to me as if he got rid of more than usual in that position. He is in pretty good condition, if anything, a little too fat, and seems otherwise to be all right. I thought he breathed pretty fast and a little "jerky" at times. Ans. Give him a pearl of Eucalyptus. (Fougera's) every 3 hours until difficulty ceases. Low diet.

H. E. M., Boston.—1. How heavy charge, and what size shot, would you advise for partridge shooting (muzzle-loading, gauge 14)? 2. The barrels of my gun are thirty inches; by cutting off two or three inches will it effect the shooting, and how? Shoots close now. 3. What is the difference between choke and cylinder bore? Ans. 1. 2½ to 3 drs. powder and 1 ounce of shot No. 8. 2. The barrels of your gun are none too long; let them alone unless you desire to ruin it. 3. A choke-bore is smaller at the muzzle than at the breech.

T. S. D., Staunton, Va.—I send you the foot of a bird that was killed in this vicinity yesterday evening. The bird measures 21 inches from tip of wing, 9 inches from tip of beak to tip of tail, length of bill, 1½ inches; plumage, slate colored above, snow white below, with a white ring (not well defined) around the neck; bill, black. We have never seen anything like this here before, and would like you to tell us what it is? The party killed several of them; they seem to be abundant. Ans. Your bird is the black tern (*Hydrochelidon fissipes*).

C. St. G. S., Bonneau's, S. C.—Can a Remington breech-loading shotgun, weight 8 pounds, No. 12, be choke-bored? Will it make any difference in the safety? I kill a fair amount of game with it, but in shooting at a box 2 ft. x 2 ft., 40 yards distance, 3½ drachms powder 1½ oz. No. 6 shot, can only, during many trials, get a pattern of 24 pellets. Would you advise me to have it choked in both barrels or one for field shooting? Ans. We do not consider that it improves any cylinder bore gun to change it to a choke. If a choke is desired, exchange the gun for a new one already choked.

G. A. J., Williamsport, Pa.—1. In shooting glass balls is it best to shoot the ball before or after it begins to descend? 2. What size shot is best for shooting pigeons from a trap 21 yards rise, with Parker breech-loader, 19 gauge, 8 lbs. 10 oz. weight? 3. What would be proper load for same? 4. I have a breech-loading gun which shoots very close—too close for cover shooting. Which would be best, have it bored to scatter, or get an extra set of barrels, or use it as it is? Ans. 1. Shoot them as you can best. 2. No. 6 shot. 3. 1½ ounces. 4. Just as you can afford.

J. A. B., Berwick, Me.—Will you please prescribe for my setter that has the mange. Lie is four years old, has been fed on oat meal, bread and milk, table scraps, etc. His eyes look bright, but at night a thick yellow matter gathers in them. Tongue and lips look natural only perhaps a little thicker. Body is hot and dry with bare spots on points of elbows outside of forelegs, and which are sore. He smells very loud; hair nearly all off tail; seems to be thirsty all the time; drinks an enormous amount of water, which runs away from him nearly as fast as he drinks it. Testicles hang low all the time, one has been swelled to three times its natural size, but it is all right now. He pants a great deal. Seems to itch intensely; wants to scratch with both hind feet and bite himself at same time. His tanks are drawn in some, breathing rather labored at 126 respiration; condition of bowels variable. Appetite variable. Water colic. I am giving Donovan's Solution three times a day, tinct. of iron once a day and wash with Caswell & Hazard's Juniper Tar Soap and black wash. He has been chained up until lately, has his liberty now. Ans. Give plenty of exercise and light diet. See that black wash is made as per prescription 37, Hallock's "Gazetteer." You do not describe the form of the eruption so that we can tell what it is. You will find particulars in "Gazetteer." Drop the tinct. of iron; it interferes with the Donovan. Increase doses of Donovan's as per prescription 35 and give him also a dose of calomel as per prescription 22, and follow with the second prescription of No. 10, leaving out the calomel and podophyllin. Give morning and evening.

SETTER, Baltimore.—My setter has several sore places on his hind quarters and one under his tail close to the root, the latter being the first to appear. Yesterday they came out on the outside of his legs, one or two near the hip bone on each leg, and about four on each side. They first appeared making the skin look pink through the hair, then they became raised like the bite of a mosquito and as large as a ten-cent piece. They then have a formation of matter on the surface not deep, but they do not seem to hurt him much and he licks them at times, but not as if they were much trouble to him. I washed him with strong carbolic soap and he seems better; two were nearly dry. If no more break out he will soon be over these. Ans. Put the animal on low diet and wash each day with Juniper Tar Soap, and also apply twice or three times each day the following wash: Calomel, one dr.; syrup of acacia and glycerine, each five drs. Fluid extract of conium (snibb's) five drs. Mix in the order given in a mortar, and when thoroughly incorporated add liquor calcei, q. s. to make one pint, meantime stirring slowly; shake well before using and apply freely. Also give eight drops of Donovan's Solution in water, three times a day, taking care that it is not given on an empty stomach. See that your dog has a clean bed and that it is frequently changed. Do not allow him to lie on the ground under the house, as the damp exhalations only aggravate the malady.

R. R. B., Galveston, Texas.—I have a pointer pup four months old which has been ailing for the past two weeks. I gave it salutarina, 12 grains; quinine, 6 grains; leptaandrin, 3 grains, followed with a dose of castor oil, as per directions in your paper, but no worms were passed. Their food has been mostly boiled beef out and, and the broth in which it was boiled. The eye is bright and natural; coat smooth and glossy; lips and tongue pale pink; breathing 60 respirations per minute; natural; appetite variable; temperature of the body, 102 deg. Fahr.; range of house and large yard; plenty of grass; condition of body poor on the same feed that keeps the other pup fat. At times she appears pained in palm, whining and biting at her hind quarters which are weak and sore to touch. Bowels slightly constive, water clear and free. Disposition affectionate and extremely jealous; exceedingly ambitious and tries to please. If you can inform me what is the matter with her from this imperfect sketch you will greatly oblige me. Ans. Probably non-assimilation of food. Give one-quarter teaspoonful of Caswell, Hazard & Co.'s Elix. Calasaya three times a day. Also three times a day four grains of the following powder: Rhuibar powdered, 6 dr.; white Castile soap powdered, 2 drs.; leptaandrin and powdered nutmegs, each 2½ dr. Do not give at the same time with the Elix.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[Post Office Box 2532.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

#### Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements must be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, AUGUST 30, 1877.

### To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts. Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

Western Manager.

### CALENDAR OF EVENTS FOR THE COMING WEEK.

**Friday, Aug. 31.**—Trotting: Cambridge, Ill.; Parker City, Pa.; Hartford, Conn.; Oskaloosa, Ia.; Macomb, Ill.; Hudson, Mich. Base ball: Hartford vs Louisville, at Brooklyn; Chicago vs Star, at Syracuse; Indianapolis vs Chelsea, at Brooklyn, at Paterson; Live Oak vs Manchester, at Lynn; Jefferson vs Star of Greenwich, at Brooklyn, E. D. Creedmoor: Infantry; 2d Brig, 1st Div. Regatta of the Newburg Rowing Association.

**Saturday, Sep. 1.**—Trotting: Macomb and Hudson, as above. Base ball: Cincinnati vs Boston, at Boston; Louisville vs Hartford, at Brooklyn; Indianapolis vs Chelsea, at Brooklyn, at Paterson; Star of Greenville vs Chelsea, at Greenville, J. C.

**Sunday, Sep. 2.**—Base ball: Cincinnati vs Hartford, at Brooklyn; Indianapolis vs Auburn, at Auburn; Live Oak vs Rhode Island, at Providence; Dansville vs Rochester, at Dansville, N. Y. Bench Show of dogs, Music Hall, Boston.

**Tuesday, Sep. 4.**—Trotting: St Petersburg, Pa.; Quincy, Ill.; Mystic Park, Boston; Quincy, Ill.; Amelia, N. Y. Base ball: St Louis vs Boston, at Boston; Chicago vs Hartford, at Brooklyn. Iowa Field Trials, Hampton, Ia. Dog Show, as above.

**Wednesday, Sep. 5.**—Trotting as above, and at Davenport, Ia. Base ball: Live Oaks vs St Louis, at Lynn. Dog Show as above. Miniature Yacht Regatta, Gowanus Bay.

**Thursday, Sep. 6.**—Trotting as above. Base ball: St Louis vs Boston; Chicago vs Hartford, at Brooklyn.

**SECOND REGIMENT CONNECTICUT NATIONAL GUARD.**—This, the crack regiment of the "Wooden Nutmeg State," began its annual encampment at Gregory's Point, South Norwalk, Monday, August 27th. We are in receipt of an invitation to be present, which we shall avail ourselves of. Col. Smith has our hearty thanks for this and other favors previously bestowed.—Ed.

—We had the pleasure of a call yesterday from Mr. W. H. Roberts, of New Orleans, Editor of the *Times*, who is on his return home from Newport and Saratoga with the expectation of finding a cooler climate. Mr. Roberts is a genial Southern gentleman and a thorough and enthusiastic sportsman. We acknowledge our indebtedness to him for the many courtesies extended, and trust to meet him again, when his visit may be more extended.

### THE INTERNATIONAL RIFLE MATCH.

THE arrival of the British Team will give the American marksmen an opportunity to judge of what sort of stuff their competitors are made, who they are, and what may be expected of them; and the first impression which strikes a critical observer of the visitors and their manner of procedure is, that they have come to win. They are not the junketing, speech-making, merry-witted friends whom we have had with us in former years, nor do they come boasting of what great feats they can and will show us. They simply say, "We will do our best;" and, as they represent the pick of a great nation, where for seventeen years or more the finer grades of target practice have been most assiduously cultivated, it is but fair to suppose that their skill is of no mean order, as their experience certainly is not. In place of enjoying the pleasures of town life, they at once proceed to isolate themselves from all those seductive influences which might tend to interfere with that perfect state of eye and head and hand; in short, that general healthfulness without which rifle shooting becomes the merest matter of chance. The greatest pleasure, the most exquisite enjoyment which our visitors can experience, is not to be met in the rounds of excursions, *fetes*, receptions, and such, but would be realized in a leading score at the conclusion of the second day's work in the great rifle match. They do not forget that their errand across the seas is to shoot, and if possible win in a great battle before the butts. This single purpose is kept steadily in view, and every move of that veteran shot and thoroughly posted marksman, Sir Henry Halford, is leading to one goal—victory.

For our American marksmen, and particularly those who are especially charged with the successful carrying out of the International Match, these facts and indications are suggestive. They mean that the very best endeavor only is to be brought forward if the honors of victory are once more to rest with our home teams. If, after the series of successes which were ours in the days of our infancy as long-range shooters, a disastrous second place should now be our lot, it will need a deal of explanation to show that it was not the result of some militating cause which might have been removed had sufficient care and forethought been exercised. When one of America's crack shots, if not the crack shot of America, declares his ability to pick a second team, able to whip the present selected champions, it certainly is that the field of choice is broad enough to enable a proper and discriminative selection to be made. We are not now in the position in which we were less than half a dozen years ago, when it was with difficulty that any team at all could be secured; now we may sort and reject, may test and try, and hold fast to that which is good. If the eight men, who are nominally at this writing the American Team of 1877, think, or a majority of them think, that their effectiveness as the exponents of American marksmanship can be added to by a change of *personnel*, it should be made without scruple, and those who step down and out should be actuated by a sufficiency of patriotism, of sportsmanlike qualities, to acknowledge that others are better than they, and rejoice with us all, and the victory they have hastened by the opportunity afforded others of doing well.

The coming match, we doubt not, so far as the riflemen and rifle managers are concerned, will be fought out in a full, open and above-board manner. It is one of the peculiarities of the sport of the rifle range, like that of the field and stream, that its tendencies are elevating. It demands a healthy body and necessarily induces a vigorous mental and moral growth. There is no royal road to big scores, and one who would enjoy the satisfaction of heading the list in a long-range match must be a genius under the definition of a prominent writer, who defines: "Genius is only the infinite capacity of taking trouble." Sir Henry Halford is endowed with a fair portion of this capacity, and he is certainly taking trouble to keep his men in good trim and form, that they in turn may be able to trouble themselves to good account with the intricacies of Creedmoor winds.

The American riflemen East and West, North and South, will be happy to welcome their friends and antagonists from across the sea. The coming battle is the more important as it is fought under those modified conditions respecting choice of team which England sought to impose upon the donors of the Centennial trophy at the match of 1876. To defeat this team is to gain a victory over what England and the National Rifle Association have united in acknowledging as the strongest team the United Kingdom can produce. Some are fearful for the hurtful effects of such a success in keeping the riflemen of other nations away from our champions and the wind-up of international matches; but we misjudge the character and spirit of the riflemen of Ireland and of Scotland, and of Sir Henry and his men, if we think of them as sitting tamely down under defeat. Being fairly overcome, it will be their policy—if they are the true sportsmen we take them—to acquire the method of their conquerors, and by sheer hard work woo victory under their banners.

In any event, the general public may rest assured that in witnessing this match they will see a fine display of nerve, of ripe judgment guiding trained muscles, and as they shout plaudits to the victors, be assured that they are giving honor to whom honor is due.

THAT HUSBAND OF MINN, published by Lee & Shepard, of Boston, is one of the most interesting little sketches it has been our fortune to peruse. It is almost a necessity in the household circle which possesses Helen's Babies. We think we have met Charlie before, and Elsie,—well, we dare not say where her prototype is to be found.

N. B.

ONE of the most important desiderata connected with the life of one who tries to study nature is the faculty of noticing little things which escape the observation of ordinary people. This is, to a great extent, the secret of the success of many naturalists and scientific men, and is, in fact, one key which opens the doors of Fame to many of our eminent men in whatever channel their talents run. But it is more especially an essential to the successful study of natural history. Audubon was remarkable in this respect, as well as in regard to his memory and eyesight. A story is told of how he once, when with a friend on one of his favorite tramps through the woods, called the attention of his companion to a bird a great way off, and scarcely visible to the eye of his friend, but which Audubon immediately recognized by its movements and coloring, giving the genus and species, and marveling at his friend's lack of vision. This was, however, with Audubon a natural endowment, but his fame was especially increased by the accurate and detailed accounts he gives of the habits of the birds he figures so grandly.

There are countless little incidents which happen to us every day, most of which pass unnoticed, yet many of them, if followed up even in thought, might disclose useful and pleasing subjects for study. Transfer this to the woods, and there ceases to be a limit to the important conclusions to which a little thing may lead, if carefully observed and followed up. It is this habit of close observation that decides the relations of cause to effect, and aids us in understanding the most intricate, as well as the most simple points in the Natural Sciences.

We invariably find that he is the most successful hunter who understands what effect the various states of the weather have upon the game he pursues; who understands where the ducks or geese will feed when the wind is in the north; what chances of success present themselves when a stiff, westerly breeze is blowing, and so forth. So must he who desires to study Natural History cultivate habits of careful observation of minute facts.

An example occurs to us in a little incident of our own experience. We were one day last spring on an ornithological expedition. A pair of crows attracted our notice on a tree near an incipient nest. We had seated ourselves to rest, and while listlessly watching their actions, their movements soon arrested our closer attention, and we then noticed, for the first time, that they used green twigs, as well as the dead ones, in the construction of their nest, and to secure the former would wrench the smaller branches from the tree-tops, using their strong beak for the purpose. On the same day, while watching the movements of a fish-hawk repairing her nest for the coming season, we observed that frequently she would sweep to the ground, and skimming slowly, rise again, and fly directly to the nest. Upon continued and close observation she was seen to seize, each time she reached the ground, a sod or bunch of grass, and without stopping her flight, bear the object away. One of these observations was accidental, the other the result of our first experience with the crows.

To arrive at definite conclusions we must have facts, and facts which are drawn from careless or cursory observations are, to say the least, unreliable. Another point which should be impressed upon the young observer is the importance of putting on paper all data as soon as possible after their acquisition.

We are in almost daily receipt of communications containing questions about birds and animals whose descriptions are so meager that it is sometimes difficult to tell whether the bird is a blue-jay or a foolish guillemot; whether the animal be muskrat or silver-fox. Amateur naturalists or persons who take sufficient interest in natural history to send questions concerning their observations should make their inquiries more specific. An indispensable thing is a pencil and note-book. In this connection we refer the reader to a pleasing communication in another column, a translation from Pliny, which can be read now so many hundred years after its author's life with great interest and profit. Let observations be recorded with all possible detail of time, place, and so on; these copied in ink as soon as convenient.

Aside from their practical value, one who has never tried it can scarcely realize how the interest derived in after years from looking back to past enjoyments is enhanced by having these data, kernels of pleasure which were garnered long ago, and which bring more forcibly to the memory the dimmed and dimming past.

CHANGES AT THE NEW YORK AQUARIUM.—We learn with regret that Mr. W. C. Coup, the founder and deservedly popular manager of the Aquarium, has sold his interest in this institution, and has retired from its management. His partner, Mr. Reiche, having purchased his interest, is now the sole proprietor.

Students, naturalists and the public generally will particularly regret that the new management has abolished the department of fish culture formerly so ably presided over by Mr. Fred Mather, and that instead of having an expert to illustrate, explain and experiment in this important branch, eggs will have to take their chances and gravid fish will struggle in inexperienced hands. Besides the interest attached to this department, it was made of practical use in stocking public waters, having distributed nearly 100,000 salmon to the waters of New Jersey, Long Island, Greenwood Lake and the Adirondacks, besides the interesting experiments with skater, squid and other eggs.

Mr. R. J. Edgar, the well-known treasurer, also retires.

**HOBART PACHA.**—A correspondent asks "Who is Hobart Pacha, whose name appears so frequently in the accounts of the present affairs between Turkey and Russia? Is he an Englishman, as some of the papers claim?" English he most certainly is, being the third son of the Earl of Buckinghamshire. His name in full is Augustus Charles Hobart, and he was born April 1, 1822, and early displayed that energy of character and strength of purpose which led him to adopt the navy as a profession, a career in which he rapidly advanced, so that he was a lieutenant in 1851, and afterward a captain in H. B. M. service. In 1848 he married the younger sister of Sir Coquelin Grant, a lady well qualified to support him in the arduous duties he has since undertaken in the Ottoman service, which he entered in 1867, when he replaced Muschav Pacha, who was no other than Captain Slade, of the Royal Marine, as Vice Vice-Admiral. He is now full Admiral, a rank gained by his successful operations against Crete, where he established a blockade that ended the hopes of the insurgents. It was Hobart Pacha who, under the name of Captain Robert, eighteen times successfully ran the blockade at Wilmington, N. C., during the late civil war, in the steamer Dawn. In 1864 he published an account of his blockade running adventures in a little book entitled "Never Caught," which is very interesting. At this time he held the rank of Post Captain R. N.

**WOODRUFF EXPEDITION.**—The arrangements of the Woodruff Scientific Expedition around the world are now completed. The steamer Ontario, with a full complement of officers, under the command of Capt. John W. Philip, U. S. N., and upward of four hundred passengers, will start from New York on the 1st of October. Among the more noted members of the expedition are such scientists as Burt G. Wilder, M. D., Professor of Comparative Anatomy in Cornell University; Albert Schaffler, LL. D., Professor of Modern Languages in the University of Berne; C. Hart Merriam, Yale College. The expedition will sail directly to St. Thomas and the Barbadoes, remaining a few days for botanical, geological, and other scientific explorations. The next stoppage is to be at the Island of Marajo, in the mouth of the Amazon; then at Rio de Janeiro. The Straits of Magellan will be reached in December, and time will be allowed for exploring the coast. Valparaiso will be reached in February, 1878, and Fiji will be reached on the first of April; after a week's delay the journey to Australia will be resumed by way of the Samoan Islands, to China and Japan. Two months will be given to the exploration of Borneo. It is intended to reach Calcutta on the 20th of February, 1879. Thence the expedition will be continued to Ceylon, Bombay, Aden, Mecca, Alexandria, the Mediterranean, Lisbon, Plymouth, England, and then to New York.

**A SPORTSMAN'S PIPE.**—Kaldenberg, 117 Fulton street, is now offering a genuine meerschaum pipe, designed especially to meet the wants of sportsmen, at the extremely low price of \$1.50. We have one, and it is comfort unsurpassed.—Ed.]

**THE LOCUST PLAGUE.**—Rand & McNally, of Boston, have issued a handsome little work of 250 pages under this title, containing many illustrations, etc. It is more particularly a treatise on the Rocky Mountain locust, or so-called grasshopper, as it occurs east of the Rocky Mountains. The characters of the species, chronological history, native home, geographical range, natural history, habits, etc., are all considered, with practical recommendations for its destruction. The author is Prof. Chas. Rily, Chief of the U. S. Entomological Commission.

**NOTICE TO SPORTSMEN.**—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$50. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining, to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box, 1,294.—[Adv. ABBEY & IMBRIE, 48 Maiden Lane.

## GAME PROTECTION.

**NEW YORK.**—Herkimer sportsmen are prosecuting pot hunters who have been detected in killing woodcock out of season.

**NEW JERSEY.**—The West Jersey Grouse Association are doing good work with their tug. Several violators of the law have recently been brought to punishment through the efforts of this wide-awake body.

**OHIO QUAIL IN 1877.**—It seems to be the opinion of some excellent gentlemen that Bob White can be killed this year in Ohio on Oct. 1, and of others that Nov. 1 is the date. Even Barrister Logan, in his note to Colonel Skinner, fails for once to indicate with his usual clearness exactly when the autumn shooting, in the case of this estimable bird, may commence. "About" such a time, or "next November," might prove disappointing to intending visitors. The amended act, passed 11th April, 1876, provides that, for 1877, no one shall kill a quail "until the 15th day of November, 1877." Succeeding years, Nov. 1 is understood to be the date. Penalty, a fine of \$2 to \$20, or thirty days imprisonment, or both.

Our summer in the "Paris of America" has not been of the torrid type that we have often had, and the nights are now quite suggestive of autumn. R. F. DUCAIGNE.

Cincinnati, Aug. 24, 1877.

**MASSACHUSETTS.**—Salem, Aug. 25.—I read with much interest Mr. Lathrop's letter in last issue, and certainly think, and earnestly hope, it always will be "much easier to write a book" than to get a game law, such as some of the shooting men of Massachusetts desire. The best proof of virtue is easily seen by comparing our fish laws and their backers with the mud-died bird laws as they stand. I think the fishermen of Massachusetts could have framed a game law themselves. We should have one that would work as well on woodcock, as theirs does on trout, and I am not a fisherman either.

TEAL.

BOSTON, Aug. 25, 1877.

EDITOR FOREST AND STREAM:

I notice in your issue of the 23d a communication from E. H. Lathrop, Esq., of Springfield, taking exceptions to my previous letters published in the Boston papers and your own, as to the efficiency of the present game law in our State. Mr. L. says: "He is aware that the law is not perfect, but he don't think that even the Massachusetts Anglers Association could have got a better one last winter." I happen to be one of those who think they could, or, to say the least, their previous acts and petitions to the Legislature show that they would not have been content without a positive close time law, no matter where killed or taken. A poor law is worse than none at all, as was fully illustrated to us the first two years of our existence, but when the Legislature granted us a positive close time for the trout and smelt laws we were enabled to enforce them effectually, and the same will apply to the lobster law. We even went so far as to say to the committee of Fisheries of 1876 that unless we could have the clause "Killed in this Commonwealth" stricken out of the trout law, we did not wish any law at all. What was the result? The committee gave us leave to withdraw, but we fought for the new substitute bill persistently, making possession positive evidence to convict, and carried the new law handsomely through both branches of the Legislature, thereby not only observing comity to other States but also protecting our own. Undoubtedly Mr. Lathrop would like to defend the present law, which I still contend is not only good for nothing but even worse than nothing, because he, as I have reason to believe, was the one who drafted the present bill; but his "astute legal acumen" did not in the present case do much good, and perhaps it would have been better for the gentleman instead of trying to undervalue the "large advice and accumulated wisdom of the Anglers Association" to have joined us, and by his aid, counsel and co-operation have done what he could toward a proper close time law, somewhat conforming to States on our borders, instead of trying with bombast to belittle the hotel keepers and sportsmen of Boston by his opinion of their "notorious acts," when he well knows, or ought to know, that the close time is off after the 4th of July in Rhode Island, Pennsylvania, New Jersey and New Hampshire; and after the 1st of August in New York and Vermont. The Brunswick, Parkers, or Whipple & Hall, (formerly Young's), are not obliged to wait until the 1st of September, which our Massachusetts law would have them, in order to obtain woodcock for their guests. They are obtained here by the barrel from the above States, and the gentlemen who purchase and furnish them probably feel that they are violating no law or justice in so doing. As to Mr. Lathrop's offer to "present" me twenty-five dollars apiece for every woodcock I can find in his county dead out of season," I have other business to attend to, and am very happy to know "that he keeps his end of the State right," although I am afraid he may be mistaken. But candidly, Brother Lathrop, try again, and get a good law that can be enforced without being obliged to get "good counsel to help us convict" (and you know these legal gentlemen present so many different views as to the legality of certain acts), so that we may help you, instead of trying to hold up our association to ridicule by talking about our accumulated wisdom and what the people and the Legislature expected when we were granted our charter," etc., etc. I feel warranted in saying that the acts of the Massachusetts Fish and Game Protective Association, and of the old Massachusetts Anglers Association, up to the present time, will be indorsed by all who know of them. Now, Mr. Editor, in closing, let me say I should prefer Mr. Hallcock's opinion on the legality of any fish or game law to Mr. Lathrop's, believing that with his large experience he would be the most correct. I had the honor of sitting in the Massachusetts Legislature of 1868, with Mr. L., and respect highly his talents, but when an ex-Judge of our Supreme Court with other distinguished legal minds of our State have said that our present law is "inoperative," let us cease all arguments and go to work to have a close time in conformity with neighboring States. I presume Mr. Hallcock will be able to answer that portion of Mr. L.'s letter which refers personally to him.

JOHN P. ORDWAY.

## The Rifle.

**THE ARRIVAL OF THE BRITISH TEAM.**—The arrival of the British Team by the City of Richmond on Saturday last brings the match of 1877 prominently before the public, and for a time we may expect to hear everybody talking rifle and rifle doings with more or less display of knowledge on the subject. The visitors on their arrival were cordially greeted by their American friends and soon to be antagonists. The Reception Committee of the N. R. A. had secured the steamboat N. K. Hopkins on which to carry the receptionists down the bay, and at noon the boat, with a large party of gentlemen on board, left the battery on its errand of welcome.

Among the party were: N. P. Stanton, President of the National Rifle Association; George S. Schermerhorn, Jr., its Secretary; Gen. D. D. Wylie, Major Henry Fulton, Col. George D. Scott, Capt. Jos. D. Story, Gen. Thos. S. Dakin, Captain of the American Team of 1877; Gen. F. Vilmar, Col. W. E. Van Wyck, Gen. K. Knox, Col. R. C. Ripley, Col. R. C. Ward, Herman C. Poppenhuisen, Gen. N. Gano Dunn, Alderman Cole, Adjutant M. B. Farr, Capt. Chas. S. Burns, Adjutant Wm. H. Murphy, Dr. G. A. Stockwell, Capt. Robbins, L. M. Ballard, G. W. Wingate, and Col. C. B. Mitchell; and Capt. James Buckley, Dudley Selph, R. G. Eyrich, Col. John Glynn, Jr.; John K. Renaud, and E. T. Manning, of the New Orleans Team. A band was taken on at Governor's Island. The Inman steamer City of Richmond had already been reported from the Highlands, and all haste was made through the Narrows. The Hopkins was decked out in flags of all sorts and styles, showing prominently the Stars and Stripes and the Union Jack. As the boats neared one another in the Lower Bay the flags of

the two nations were dipped from the little American steamboat and the Atlantic liner in reciprocal compliment, while a stout little howitzer on the forward main deck of the Hopkins blazed away, deafening everybody with a many-rounded salute. The riflemen were soon shouting recognitions across from boat to boat. Lieut. George Fenton, with his great, brawny, Irish figure, and ruddy, good-natured face, was the first to be identified among the long line of faces looking over the bulwarks. Then Milner upon the main bridge was caught sight of, and as he had not been announced by telegraph his appearance caused some surprise, and certainly did not reassure the American marksmen in any anticipations of an easy victory. A moment later, as the Governor's Island Band was blowing out "God Save the Queen," Sir Henry Halford sprang upon the bulwarks and clinging to the shrouds was soon waving his hat and exchanging nods of recognition with the American party, many of whom he had entertained during their trip to British soil in 1875. One after another of the marksmen were picked out among the Richmond's passengers, and cheer after cheer and tigers were yelled over the water, while the Hopkins' team whistle screeched its worst. At last a gang-plank was thrown out from boat to boat, and Capt. Casey, Chairman of the Reception Committee, stepped upon the Richmond's deck, and shaking hands heartily with Sir Henry Halford, extended to him the first welcome, and invited him to step upon the Hopkins to meet the President of the National Rifle Association and the other gentlemen of the American party. Then as one after another of the British team stepped along the gang-plank rounds of cheers were given, the three ladies of the party getting the lion's share as they tripped fearlessly along the rather slender passageway. Of course there was a speck-making, but luckily little of it, Judge Stanton beginning the infliction and saying:

"SIR HENRY HALFORD, CAPTAIN OF THE RIFLE TEAM OF THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND: It is with great pleasure that I, on behalf of the National Rifle Association of America, extend to you and to those accompanying you a hearty welcome. Though you and your associates may be surrounded at this time by strange faces, yet the interest that you personally have shown in promoting greater excellence in rifle shooting has made the name of Sir Henry Halford as well-known to the friends of Creedmoor on this side the Atlantic as it is to those of your own Wimbledon and Dollymount on the other; and the names of Ferguson, the two Fentons, Evans, Rigby and Milner, Humphry, Gilder, Frazer and Piggot, have become familiar names to us all, and we greet you with a hearty welcome. Your mission is well known—I may say the civilized world over. A great and unprecedented contest is soon to take place between representatives of two of the greatest nations on the face of the earth. Armed and equipped as the regulations direct with deadly weapons they will meet at Creedmoor, and then and there in a long-range match contend for the 'American Centennial Trophy and Championship of the World.' From this time till the day of the contest, not only will every facility be afforded you for practice and obtaining information on the range at Creedmoor, but also caring for your personal necessities, comforts and pleasure while you remain with us, will be our highest aim. Again we welcome you and extend the friendly hand."

Then as the two gentlemen shook hands the crowd from the two sides of the globe shouted and hurrahed. Sir Henry Halford, in responding, was short and spirited, saying:

"It is indeed a peaceful errand on which we are bent, though we carry deadly weapons. For the past two years I have looked forward to this visit with the greatest pleasure and interest. As the company is aware, circumstances prevented the appearance last year of a British team. But I felt that it was only deferred, and now the pleasure of meeting is the greater as the delay has been the longer. I can only say that we are here, all in excellent health and spirits, after a most prosperous, rapid and peaceful ocean trip, more than astonished and pleased with the hearty welcome with which we are met. Never before in the history of the world has such a contest been brought about—the most friendly of battles with the most deadly of weapons. The Americans have enjoyed an unprecedented succession of triumphs. Again and again has the wreath of victory fallen to them, and it is, I think, about time for a lapse in this chapter of monotony. All I can say is we shall strive to put the period to the story. The gentlemen of the team I have the honor to command are all of them good shots, and I can safely say the team is not a bad one. More I cannot and dare not utter in the presence of such thorough experts as the Americans have shown themselves to be. Of one thing I am sure, that the Americans are far better speech-makers than we are at home, and I can only ask them to pardon any deficiencies in my speech, while I offer them and American riflemen generally many thanks for the kindly feeling shown and the many valuable lessons in long-range practice given by them, and particularly for the attentions shown on the present occasion."

Without waiting for more than an hour's breathing spell in the city, Sir Henry and his party pushed on to the quarters they had determined on at Stewart's Garden City Hotel, a few miles from Creedmoor, where they will remain in quiet and strict seclusion, the riflemen taking all the practice possible until the day of the match.

The team party consists in all of eighteen gentlemen and three ladies. Sir Henry Halford, Lieutenant-Colonel by rank in the volunteer service of England, comes as captain of the team. He is an elderly gentleman, with full, gray beard, but a sharp eye and thoroughly healthful constitution. He is enthusiastic in rifle matters, and if careful management and strict attention to each and every detail can insure success the victory will lie with his team. Lieut.-Col. C. Lenox Peel, late of the Scots Guards, is an old Wimbledon manager, having for a number of years formed one of the working staff at the Wimbledon meetings. He will act as adjutant of the team under Sir Henry Halford. Capt. Bowly, of the Twentieth Regiment Foot, is a young man, and accompanies the party as a general assistant. Mr. Waller is a stout gentleman, who for a number of years has filled various posts about the Wimbledon meetings. E. Vaughan Thompson is another of the non-shooting members of the party. He is a cousin of Sir Henry. The last of the non-shooting men is Vernon K. Armitage, who comes accompanied by Mrs. Armitage merely to see the match.

The riflemen proper are twelve in number, all of them standing well up among the crack shots of the United Kingdom. Lieut. George Fenton, of the Seventy-seventh Foot, and Wm. Rigby, cousin of John Rigby, are veterans in the list of Irish shooters. Joshua K. Milner is the only man in the party who has taken part in the matches of the three previous years, while R. S. Greenhill, who in 1875 shot at Dollymount, comes over to America for the third time as a 1880 man. The Scotch contingent consists of three

men—G. Grant Peterkin, a young man, but of Elcho Shield experience; has been in this country before, having lived for a time in Virginia. Arthur M. Fraser and Wm. Ferguson are the other tried and trusted "brither Scots," in whom Sir Henry is well satisfied. The English section of the team includes five names: Lieut.-Col. Fenton, a middle-aged gentleman and an "old reliable" in the English Elcho circle; he is accompanied by Mrs. Fenton; H. Saville Ward Evans, a shrewdly-built gentleman of student-like appearance; E. Taylor Pigot, a young shot, but a good one; Wm. H. Gilder, who for fourteen years has filled the post of Sergeant Instructor of Musketry at Harrow, and A. Paget Humphry, an old Queen's man, who travels in company with his wife.

**CREEDMOOR, Aug. 25.**—In the absence of many of the Creedmoorites down the Bay looking after the British Team, the Remington match failed to fill, and was laid over. But the third contest for the *Turf, Field and Farm* drew a fair list of entries, though the score was not particularly brilliant. Capt. A. Anderson, of New Jersey, held top place.

**THE AMERICAN TEAM PRACTICE.**—The first team practice of the newly-chosen American international team for 1877 was held on the Creedmoor ranges on the 21st inst. The full team were out, as were the two reserves, and if the squad is to show the improvement which is to be expected as they get into a good working system, some magnificent scoring may be looked for. The wind held from 4 to 6, and a clear, gray light favored the riflemen most of the day. Of the team General Dakin was so unfortunate as to find some imperfection in the breech-block of his rifle, and came out at the foot of the list with a poor score. Hyde shot wonderfully, getting a grand total of 214 in the possible 225, the champion score of Creedmoor so far, beating Jewell's pair of 213's, but not yet up to the big scores heard of from some of the country ranges. It is somewhat suggestive that eight of the ten team men showed misses in the scores, Jackson, the Bostonian, and Hyde being the exceptions. It is the diminution of these "unaccountable misses" which alone remains to make these modern breech-loaders the most precise arms extant. The shooting, as a whole, was brilliant, the leading eight men on the team targets reaching an aggregate of 1,639 points, or within one point of 205 points per man.

Wednesday, the 22d, the entire team were again on the range, but neither the day nor the score was so good as on the preceding day. At present there are several members who are "good holders but poor judges;" in other words, providing they have the assistance of sharp coaches on matters of elevation and windage, they can be relied upon for a good score. But the other members of the squad receive no assistance in return from such members. Of course there is grumbling—a little—about that, since it may lead to an excellent score for the pupil and an inferior one for the coach. The actual team total on the second day was 1,562 points, but taking the eight highest scores, which include those of the two reserves, Lamb and Hepburn, the total reached was 1,596, very good as long-range shooting generally goes, but not enough to suit the team men. The full scores for the two days stand:

**THE NEW ORLEANS RIFLE TEAM.**—The Crescent City Rifle Club men, by their performances on the Creedmoor ranges, have won the admiration of the long-range men, and completely silenced the doubts of those who were wont to look upon our reports of their home doings as somewhat apocryphal. They are really a fine band of shooters, and made a very good beginning at long-range practice on the 21st. Mr. Dudley Selph, that phenomenal shot, whose great New Orleans score of 219 has been the wonder and envy of riflemen of all ranges, seemed as though he was to do something even better, and at 800 yards created a genuine ripple of surprise in a straight run of fifteen bull's-eyes, a feat accomplished but once before at Creedmoor, by E. Johnson, of the Irish Team, on the first day of the Centennial match in September last. The other gentlemen of the Southern team did not show such good results, but enough to convince good judges that with the care and earnestness with which they practice and mutually assist one another, the finally-chosen four men will make great scores in the inter-state match.

On the 22d inst., far off to the extreme right-hand target of the range the little knot of New Orleans riflemen were again busy, pulling together; and while the American team fell off, this band of keen-eyed Southerners actually pulled ahead, their second day's work showing the best total, despite the fact that Eyrich is still on the semi-sick list, and that Manning at 800 yards put in a bull's-eye on the wrong target. Renaud at 1,000 yards was specially unfortunate, getting five misses after a magnificent opening early in the day. Dudley Selph, as usual, led the squad, and led the field as well, with 206 points. The men have a good style of work, and when they get into thorough working trim their system will enable them to show some large aggregates. The full scores of the Louisianians for the two days stood:

**A SCOTCH OPINION ON THE PROTEST.**—The *Military Record and Volunteer News*, of Glasgow, Scotland, an excellent sheet on the broad subject of Scotch rifle shooting, in its issue of Aug. 8th, has an excellent criticism on the Scotch protest, and, we think, covers the question fairly and gives a hint which the N. R. A. of New York would do well to heed. It says: "We regret exceedingly to notice the acrimonious feeling displayed in a letter from the Secretary of the Scottish Rifle Club, in reference to the forthcoming International Match at Creedmoor, and it seems to us a pity that the Scottish Club should endeavor to play a dog-in-the-manger policy. At the same time, we have no hesitation in saying that the American Rifle Association are blameable for leaving their invitation in so ambiguous a form as to lead to misunderstanding and schism. The error of the American secretary seems to have been to have sent his circulars of invitation broadcast among rifle associations and rifle clubs of repute, and it certainly does behoove the United States Association to explain explicitly the understanding on which their invitation was given. If they stretched courtesy too far last year let them say so at once, and give a proper definition of their meaning in the conditions they lay down, 'that the various teams participating must be native born citizens, residents of the countries they respectively represent, except in the case of teams representing a provincial territory of a government, in which case residence in the province will be sufficient, provided the member is a native born subject of the parent country. We are not such churls as not to wish the combined team of English, Irish and Scots every success on foreign soil.'"

—The Stock Exchange Rifle Club had a competition on the 21st inst. for the bronze medal of the N. R. A., presented them as an affiliated club. The firing was at 200 yards, any rifle, ten shots per man. Daniel Chauncey, Jr., an efficient Seventh Regiment man, held first place, the scores standing out of the possible 50 points:

|                  |    |                |    |
|------------------|----|----------------|----|
| D. Chauncey, Jr. | 38 | J. R. Maxwell  | 26 |
| A. S. Davis      | 35 | W. P. Phelpard | 26 |
| C. A. Meigs      | 35 | S. E. Cook     | 26 |
| A. E. Drake      | 33 | E. W. Gould    | 21 |
| T. W. Hughes     | 28 | F. L. Eames    | 20 |
| C. A. Grant      | 25 |                |    |

—Morris B. Farr, editor of the *National Guardsman*, has been wisely chosen by Gen. Woodward Executive Officer of the fall meeting, as his adjutant. This means that many of the annoying little neglects which have marked these meetings heretofore will be wanting in the 1877 gathering.

**NEWARK VS. ROCHESTER.**—On the 22d inst., the team of the Rochester amateur rifle club left for Newark, N. Y., to shoot the return match with the amateur rifle club of that village. Everything promised a spirited contest, the sun pouring down on shooters and spectators in fervid style. The accidental shots were few, a single miss on each side and not a single outer telling the accuracy of the work. The score stood:

**ROCHESTER TEAM.**

|             |    |                           |    |
|-------------|----|---------------------------|----|
| J. H. Brown | 55 | 4 4 4 4 4 4 4 4 4 4 4 4 4 | 68 |
| S. E. Rider | 55 | 4 4 4 4 4 4 4 4 4 4 4 4 4 | 68 |
| S. A. Rives | 55 | 4 4 4 4 4 4 4 4 4 4 4 4 4 | 68 |
| R. B. Yates | 55 | 4 4 4 4 4 4 4 4 4 4 4 4 4 | 68 |
| E. Angell   | 55 | 4 4 4 4 4 4 4 4 4 4 4 4 4 | 68 |
| E. E. Combs | 55 | 4 4 4 4 4 4 4 4 4 4 4 4 4 | 68 |
| Total.....  |    | 382                       |    |

| NEWARK TEAM.    |                            |
|-----------------|----------------------------|
| F. Garlock      | 55 5 5 5 4 4 4 4 4 4 4 4 4 |
| W. S. Overhill  | 55 4 4 4 4 4 4 4 4 4 4 4 4 |
| D. F. Wilcox    | 55 4 4 4 4 4 4 4 4 4 4 4 4 |
| W. H. Nichols   | 55 4 4 4 4 4 4 4 4 4 4 4 4 |
| E. B. Elliott   | 55 4 4 4 4 4 4 4 4 4 4 4 4 |
| H. D. Van Dusen | 55 4 4 4 4 4 4 4 4 4 4 4 4 |
| Total.....      |                            |

This is claimed to be the largest score on record for a two hundred yard off-hand contest with a team of six. It is the seventh match of the Rochester Club at that distance, and they have won all of them. The Newarkeers took their defeat in a gentlemanly spirit, and subsequently entertained their victors at supper. We would suggest that the Rochester boys try their luck in the short range team match at Creedmoor during the fall meeting.

**WORCESTER, MASS.**—The rifle team of the Worcester Sportsmen's Club came off at the Greenwood range, on the 17th inst. The weather was delightful, but the wind was variable and shifting, rendering close shooting particularly difficult. Mr. A. G. Mann offered a handsome powder horn as a prize for the best total score of the day, and it was won by Mr. C. B. Holden. The shooting was in conformity to Creedmoor rules, 17 shots each, at 800, 900 and 1,000 yards, with possible scores of 75 at each range, and 225 total. The scores stood:

|               | 800 | 900 | 1,000 | Total. |
|---------------|-----|-----|-------|--------|
| C. B. Holden  | 72  | 60  | 62    | 194    |
| A. L. Rice    | 61  | 63  | 62    | 186    |
| G. J. Hugg    | 65  | 45  | 49    | 169    |
| Frank Wesson  | 61  | 45  | 63    | 169    |
| A. G. Mann    | 64  | 60  | 57    | 161    |
| N. Washburn   | 65  | 57  | ret.  | —      |
| L. E. White   | 65  | 45  | ret.  | —      |
| Stedman Clark | 68  | 68  | ret.  | —      |
| A. F. Hatch   | 36  | 38  | ret.  | —      |

On the 24th two trial scores were made at 800 yards, the total standing out of the possible 225:

|                   | 1st Trial | 2d Trial | T <sup>th</sup> |                  | 1st Trial | 2d Trial | T <sup>th</sup> |
|-------------------|-----------|----------|-----------------|------------------|-----------|----------|-----------------|
| A. L. Rice.....   | 72        | 70       | 142             | A. Houghton..... | 66        | 67       | 133             |
| G. J. Rugg.....   | 63        | 70       | 133             | Edman Clark..... | 61        | 67       | 127             |
| Frank Wesson..... | 71        | 67       | 138             | G. Mann.....     | 63        | 44       | 107             |
| L. G. White.....  | 69        | 65       | 134             |                  |           |          |                 |

**BOSTON—Walnut Hill.**—The fifth competition for the Ballard mid-range rifle came off on the 23d inst. at the range of the Massachusetts Rifle Association at Walnut Hill. Mr. W. H. Jackson had won in two previous contests for the prize, and Mr. John A. Lowell in two. Mr. Jackson, leading in this competition, took the rifle, scoring 117 in a possible 125. Mr. T. H. Gray made an excellent score in the 800-yards shooting, but owing to something breaking in the lock of his rifle he was compelled to withdraw. This will be considered also one of the competitions for the position of one of the representatives of Massachusetts at the national meeting. Mr. Jackson will be one of the four sent by this association, his back record being allowed. The distance was 800, 900 and 1,000 yards, 7 rounds at the first, 8 at the second, and 10 at the third; position, any within the rules. The following was the score:

|                    | 800-5   | 900-5         | 1,000-5       | Total |
|--------------------|---------|---------------|---------------|-------|
| W. H. Jackson      | 100-5   | 4 5 5 5 5 5 5 | 4 5 5 5 5 5 5 | 117   |
| Charles C. Hebbard | 1,000-4 | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 108   |
| J. E. Shepard      | 800-5   | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 103   |
| J. Wemyss, Jr.     | 900-5   | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 101   |
| Wm. Gerrish        | 1,000-3 | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 98    |

| W. M. Ward         | 900-5   | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 87    |
| J. Borden          | 1,000-0 | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 87    |

**Walnut Hill, Boston.**—The second of four contests to decide who shall be the four representatives from the Massachusetts Rifle Association to the national meeting of riflemen came off at Walnut Hill Range on the 21st inst. The day was very favorable for the practice, and the extraordinary success of Mr. William Gerrish, who scored 212 out of a possible 225, elicited general remark as being the best score yet shown at this range. The scores stood:

|                   |         |               |               |            |                    |    |    |     |
|-------------------|---------|---------------|---------------|------------|--------------------|----|----|-----|
| Wm Gerrish.....   | 800-5   | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 4 5 7-3    | 212                |    |    |     |
|                   | 900-5   | 5 5 5 5 5 5 5 | 5 5 5 5 5 5 5 | 3 4 7-0    |                    |    |    |     |
|                   | 1,100-5 | 5 4 4 5 5 5 5 | 5 5 5 4 4 4 4 | 6-63       |                    |    |    |     |

| Totals         | 60       | 58       | 37       | 155   |

The second contest will take place on the Michigan side of the river, but the exact time and place are not yet agreed upon.

Zettler's Rifle Club held their last practice shooting for the month of August, Tuesday evening, Aug. 27, at the Gallery, 207 Bowery. A handsome trophy was presented by the Zettler Bros. to the member who made the most 1-inch bull's-eyes in these shootings, or thirty shots. It was won by Max B. Engel, who made twenty-five eyes; ten members of the club were in the twenties close after him. Mr. Engel has presented the trophy to the club for competition, same conditions, for month of September. The gold medal or "centre badge," which has been shot for every Friday evening, open to all comers, was won for the third time by D. L. Beckwith, Friday, Aug. 17, and it now becomes his property.

Company A, 48th Regiment, N. G. S. N. Y., have entered for the third competition for the Nevada Badge and fixed Sept. 6th as the date of shooting. This is the first entry this year, but other entries may be looked for from the 7th and 23d, and perhaps from other regiments.

The American team have chosen a new shooting costume, and instead of a quiet suit of green or blue or gray, have chosen a dirty brown, and one of the New York dailies says very kindly that "clad in the new garmenture, the marksmen look much fiercer than a group of convicts." We would rather say that they would pass for a parcel of bon-ton plow boys.

The first practice of the British team on the American range last Tuesday showed a team total of 1,542 points against a total of 1,640 by the first American eight. The New Orleans men are working most magnificently, Selph getting a virtual score of 217 points, though with a bull's-eye on the wrong target his actual score drops to 212 points.

The *Military Record*, of Glasgow, Scotland, relates, in its issue of Aug. 15, that another death on the rifle range has taken place at Hawick (near Edinburgh) last week, when a young man named Easton, who was in the butt marking for a comrade of the 4th Roxburg R. V., was shot in the forehead, death being almost instantaneous. It is surmised that he had been looking out of the mantlet when the fatal shot reached him. Such events are called "accidents," seemingly because they should not happen, but they are the result of carelessness, negligence and breach of regulations. Target shooting need not be a dangerous exercise.

The Royal Artillery and Engineers' Military Academy, Woolwich, has a remarkable cadet this year in Mr. Codd, son of a clergyman. He has headed the list by nearly 2,000 marks, and also carried off the eight best prizes, besides the sword given by Lord Napier for the best essay on the Waterloo campaign.

The greed of the owner of adjacent land at Creedmoor has induced the abandonment of the 1,200 yards match from the fall meeting programme.

Reports from the Montreal Rifle Meeting show that Homer Fisher, the New York representative, is doing good work there.

# Game Bag and Gun.

## GAME IN SEASON FOR AUGUST.

|   |  |
|---|--|
| Woodcock, <i>Philohela minor</i> .          | Red-backed sandpiper, or ox-bird         |
| Black-bellied plover, ox-eye, <i>Squar-</i> | <i>Tringa americana</i>                  |
| <i>larola hutchinsoni</i> .                 | Great marbled godwit, or marlin,         |
| Ring plover, <i>Egialitis semipalm-</i>     | <i>Limosa fedoa</i> .                    |
| <i>atus</i> .                               | Willet, <i>Totanus semipalmatus</i> .    |
| Stilt, or long-shanks, <i>Himantopus</i>    | Tattler, <i>Totanus melanoleucus</i> .   |
| <i>nycticollis</i> .                        | Yellow-shanks, <i>Totanus flavipes</i> . |
| Red-breasted snipe, or dowitcher,           |  |
| <i>Macrorhamphus griseus</i> .              |  |

"Bay birds" generally, including various species of plover, sandpiper, snipe, curlew, eye-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limacopsis* or Shore Birds. Many States permit prairie fowl (plumated grouse) shooting after August 15th.

The frequent alteration of game laws makes such confusion that sportsmen are kept quite in the dark as to when shooting on various kinds of game is permitted. We therefore append the following table for reference:

| States | Plumated Grouse. | Ruffed Grouse.   | Quail.           | Woodcock.        |
|--------|------------------|------------------|------------------|------------------|
| Ill.   | Sept 1 to Jan 15 | Oct 1 to Feb 1   | Oct 1 to Feb 1   | Sept 1 to Jan 15 |
| Ind.   | Oct 1 to Dec 1   | Nov 1 to Jan 1   | Nov 1 to Jan 1   | July 1 to Jan 1  |
| Iowa.  | Aug 15 to Feb 1  | Sept 15 to Dec 1 | Oct 1 to Jan 1   | July 1 to Jan 1  |
| Mich.  | Aug 1 to Oct 1   | Sept 1 to Dec 1  | Sept 1 to Dec 1  | July 3 to Nov 1  |
| Neb.   | Aug 15 to Nov 1  | Sept 15 to Jan 1 | Sept 15 to Jan 1 | July 4 to Nov 15 |
| N.Y.   | No Shooting      | No Shooting      | No Shooting      | No Restriction.  |
| Kans.  | Aug 1 to Feb 1   |                  | Oct 1 to Jan 1   |                  |

A law was passed in Nebraska last February, prohibiting the shooting of any kinds of wild bird except waterfowl, snipe, waters and woodcock. No close season is specified for woodcock.

TABLE OF CHARGES CONFIRMED.—I see in your Aug. 16th number the report by B. R. B. of Galveston in reference to the charges he uses in his two guns—Nos. 12 and 6 bores, the former choke, the latter cylinder and muzzle-loader, and I am much obliged to him for it.

I take no special interest in any particular size or kind of gun, but hold them all up alike for experiments and general deductions. I hope my intended impartiality in what I have to say may prove the more useful to the public. Nor do I contend that any two guns require the same charges. They differ as our watches do, yet the best guns run nearly alike in charges, and so much so that a system of charges may be set down for them with the greatest utility to the sporting world. Especially is this the case in behalf of new beginners with the gun who know nothing of it. The old gunner may require no aid, but the boys and youths are looking after it. Is it possible that after a century or more of practice with the shot gun, and this almost the wide world over, that we are unable to form a general table of charges for reference and instruction? Is it possible that it is indefinite and confusion on this subject? Can we not stick a pin somewhere; if not on the line of positive certainty, then so nearly along the edge of it as to be use-

ful? I know we can, and without laying a snare to any one. This done, there is yet left time to all who desire a full field for experiments, a thing I cannot too heartily endorse.

Speaking of his experiments, your correspondent says: "My Fox I had to target two hundred times, and find her best charges to be 33 drachms of Hazard's No. 3 Ducking, 1 1-16 oz. of fine shot, or 1 1/4 of No. 3 for duck." I will now bring forward from the "Table of Proportionate Charges" (see Hazard's "Gazetteer") the charge set down for this No. 12 bore. It is 3 1-3 drachms of powder and 1 1/4 oz. shot for shooting within 50 yards, with the remark in the back that for duck and long shooting this charge may be increased according to the power of the gun and the ends to be obtained. This coincidence of charges is pleasing to learn, and, I trust, to all. Nothing could be more satisfactory to me or (by comparison with the table) to the beginner with the gun.

Again he says: "My old six bore takes 6 1/2 drachms of Hazard No. 4 Ducking and 2 ozs. No. 2 shot." This is evidently his duck load. I now bring forward the charge laid down in the table above referred to for this same No. 6 bore. It is 5 1/2 drachms of powder and 1 1/4 for shooting within 50 yards, but which charge for ducks and longer shooting may be increased as above stated. Nothing could compare more harmoniously or be more pleasing to learn in reference to the correctness or utility of the "Table" than B. R. B.'s report. I am satisfied from the results that his experiments have been made with care, and I wish to give him here full credit for the valuable information he has been pleased to give to the public. I have other like experiments of confirmation before me in F. & S., which I hope to bring forward hereafter.

It will be seen in particular that B. R. B.'s loads, the results of long trials as well as practical experience, fully confirm and agree with the "Table" loads; that they are virtually proportionate charges, each bore having a proportionate amount of ammunition. This is just as might be expected where a table is not only based on true mathematical principles, but is further fully confirmed by general practice I believe.

MAJ. H. W. MEERILL.

New Rochelle, N. Y., Aug. 22, 1877.

CHILLED SHOT.—In the FOREST AND STREAM issue of the 9th instant, among your Answers to Correspondents, I noticed one on the subject of Chilled Shot. Being about to lay in a large stock for the fall campaign, I thought it advisable, before so doing, to get the opinion of a friend, in whose judgment in such matters I place the utmost confidence, and accordingly received the following:

TORONTO, August 11, 1877.

DEAR B.—You can bet your last dollar on the "chilled" shot. Last fall the St. Clair Flats Shooting Club used nothing else; and for laying game out still in all kinds of shooting—sky-scraper, etc.—I have never used anything better; and where the shot goes half way, the chilled goes through.

The prospects for fall shooting on the "Flats" are of the best. John East tells us the red-heads have bred in large quantities, with the big ducks more numerous than ever; and as the grounds will be well protected from outsiders, we calculate on a few big days.

Yours truly,

G. W.

The writer of the above has shot ducks for market for years, and is by all odds the most successful duck shooter in the Province of Ontario (if not in the Dominion); in fact, there is no better man in a "marsh," and has killed on those same "Flats," on an average, about 1,000 ducks every autumn for the last twelve or fourteen years, so that his opinion should have some weight.

VENATOR.

Marshall, Texas, Aug. 18, 1877.

PLINY, the YOUNGER, as a HUNTER.—Chancing to pick up a volume of Pliny, I read a letter from him to his friend Cornelius Tacitus, the great statesman of that time, which is to me quite interesting, as it is just my idea of enjoyment in the woods. I have translated roughly as follows:

You will laugh, and you may (well) laugh, for I, whom you know, have killed three boars, and, in truth, beautiful ones. You? you say; (yes,) I, indeed, yet I did not depart wholly from my accustomed rest and quiet. I was sitting by my nets, having neither my spear nor lance near me, but with my pencil and note-book I was meditating something, and was writing it down so that if I returned with empty hands my book would nevertheless be full of notes. There is no reason why you should (make fun of) this way of studying. It is strange that the mind is influenced by the excitement, and by the movement of the body. The woods about one, the solitude and that silence which is given to the hunter are great incentives to thought. Therefore, when you go out hunting, take my advice, and, together with your lunch-basket and flask, carry your note-book. You will not find that there is any more pleasure in hunting on the mountains than in studying nature. Farewell.

This is admirable advice to lovers of nature, though given over a thousand years ago; namely, to take a note-book with you while hunting or fishing, and jot down anything of interest which comes under your observation. It is very pleasant in after years to look over such a book.

W. M.

PARTS OF A GUN.—Bolts.—Irons which enter the loops or eyes of the barrel to fasten it to the stock. Bridle.—A polished piece of steel which caps the tumbler, and is secured by screws; it also receives the sear screw. Butt of stock.—The shouldered extremity of the stock. Cap.—It covers the ramrod screw, but of course is obsolete in the breech-loader. Casting-off.—The outward inclination given to the butt of the gun, being intended to incline the line of the aim inward. Swivel.—A small catch suspended from the neck of the tumbler to receive the extremity of the mainspring. Cock.—This is more frequently called the striker, or hammer. Escutcheons.—Ornamental pieces of silver to prevent the bolts from defacing the stock when the turn-screw or pinners are applied; escutcheons are also used on other parts to receive initials, crests, shields, etc. False-breech.—This receives the butt or nose of the breech when the barrel is fastened into the stock. Fence.—The part between the cock and nipple which receives the solid cock. Guards.—That which defends the triggers. Heel plate.—The plate with which the butt of the stock is tipped. Lock-plate.—Supports the principal works of the stock. Loops.—Eyes on the outside of the fore part of the stock which receive the bolts that fasten the barrels to the stock. Mainspring.—That by which the tumbler is worked with the cock. Nipple, or pivot.—The small iron pillar that receives the copper cap; the latter, however, is obsolete in breech-loaders. Pipes.—Tubes to receive the ramrod; done away with, of course, in breech-loaders. Rib.—Central piece of iron which unites the barrels and receives the ramrod. Scroll-guard.—An extension of the guard which receives the

right hand in firing the gun; it is now superseded by the pistol-handle stock. Sear.—That which catches the tumbler for half or whole cock, on being pushed up by the trigger. Sear-spring.—The spring which holds the sear in the notches of the tumbler at either half or whole cock. Side-screw.—A screw which fastens on the locks. Sight.—A patch of metal, usually of silver, placed near the gun-barrel to direct the aim. Spring-cram.—A useful instrument to assist both in taking to pieces and putting together the parts of the gun. Tail, longer, or finger.—The neck, shoulder, or arch of lockhammer. Top-rib.—This opposes the rib which unites the lower arches of the barrels; when it is very prominent behind, it is called the elevated rib. Trigger plate.—The trigger works in it. Trigger springs.—Are small springs met with in all locks, and are intended to keep the triggers close to the sear. Tumbler.—The moveable centre-piece of a lock which falls with and is subservient to the cock. Tumbler-screw.—This fastens on the cock. Vent-hole.—Used only in muzzle-loaders, are intended to let out the gas, and are supposed to lessen recoil. Worm.—The screw at the end of the ramrod; obsolete in breech-loaders.—Land and Water.

A SHOCKING ACCIDENT.—Wm. Hardy, of Detroit, Mich., was accidentally killed while on a hunting expedition at the River Rouge. He left home early in the morning, and about 12 o'clock brought up at a small bridge across the river, where he stopped for the purpose of shooting at some fish which could plainly be seen swimming below. While loading an empty barrel his gun slipped from his hands and lodged between two timbers, the muzzle toward him, and in the descent the hammer fell and the weapon was discharged. The heavy load tore away the unfortunate man's left wrist and lodged in the lower part of his face, mutilating it in a shocking manner and causing instant death.

HOW TO BUREST A GUN.—A curious case of gun bursting came to notice a few days since. A gentleman was cleaning his gun with a swab and string, when the swab became jammed, to remove which he took a joint of fishing rod which happened to be just a twelve-bore, fitting the gun nicely, but the moisture from the swab swelled the end of it, and this also became immovable. Leaving the room for a few minutes, he was startled by a report, and returned to find his new breech-loader had become bankrupt by the swelling of the rod.

SHOOTING FROM THE HIP.—H. L. Bingham, of San Antonio writes: "Some of your correspondents seem credulous as to accuracy in shooting from the hip. I for years practiced that style of shooting on snipe and woodcock in Ohio and Michigan, and up to the time I came to Texas, I believe I was fully an average shot; but I now, however, in quail shooting, bring my gun well to the face, and take a quick steady aim, but it required over a year's practice to do this, as I was so fixed in the hip practice. Now, I occasionally shoot with my gun only breast high, and if any one doubts my ability to make a good bag, let him come to San Antonio this fall, and he will find he will have to work to keep even."

H. L. BINGHAM.

HOW TO TAKE LEAD FROM A GUN BARREL.—A quick and simple and unfailing way is to warm a gun or pistol barrel slightly, and then anoint the interior with mercurial ointment. In a very few minutes the mercury forms an amalgam with the lead, when it will wipe out clean, leaving the surface perfectly smooth. I have used it for years in all kinds of arms, and it works to a charm.

H.

[We indorse the above.—Ed.]

LOADING SHELLS.—Loading shells is one of the most essential things in shooting, and no matter how fine and costly the gun, or how expert a shot, if the shells are not properly loaded it will not shoot the way it should. Mr. C. H. Hitzmann, 943 Broadway, makes it a specialty to load shells, and any shell loaded at his place can be relied upon. He loads shells for some of our most noted pigeon shooters, and it will be seen that one badly loaded shell would do much mischief, yes, even lose the match. Shells can be had loaded with any brand of powder, soft or chilled shot, and each shell is marked as to the quantity of powder it contains, also the quantity of shot as well as the size of same.—[Ad.]

MASSACHUSETTS.—Salem, Aug. 25.—The past week has been very dry. Nothing legal that I can gather from any part of the county. Woodcock and partridges are being shot in spite of the law, and much indifference is manifest among good sportsmen. Gunners say if the State can serve woodcock for the President, they'll shoot just as they please. Massachusetts Yankees are pretty democratic. Seriously, I think the Governor (off hats!) set us a bad example. Saw first white-winged covey at Kettle Cove the 23d, also saw two loons and a large lot of herring-gulls.

TEAL.

East Templeton, Mass., Aug. 29.—Ruffed grouse are very abundant here, and promise good after Sept. 1, having been well protected during the season. Woodcock are also plenty, with no one to hunt them, the former birds being the favorite game in this region.

C. E. J.

NEW YORK.—South Oyster Bay, L. I., Aug. 23.—Agreeable to promise I report: Got yesterday of local birds—32 willet, plover, yellow legs and robins (mostly robins), besides ring-necked and oxeyes. No flight, nor will probably be any till a change in the weather, when, whoever is on the ground, probably will have good success.

R. R. T.

PENNSYLVANIA.—Harrisburg, Aug. 24.—A fine specimen of the "timber tootle"—a full-grown male bird—was shot along the river shore, where the large sewer from Pine street enters the Susquehanna River, Aug. 23, by Mr. Ed. Killough. A couple of little gamins, while hunting "helgromettes" for bass fishing, disturbed Sir Philohela, who took wing under their very noses and lodged among some bushes a hundred yards away. Killough, happening along, took in the situation, sent for his gun and bagged the woodcock. The river is here a mile wide. The bird must have flown from the opposite or Cumberland side of the river, landed on some grass plots, then reached one of the islands—from whence, after a strong flight of 500 yards, it must have thus reached our city front.

AUDUBON.

MARYLAND.—Arlington, Aug. 24.—Woodcock are unusually abundant this season throughout the State. Fire bags are made by the sportsmen of this (Baltimore) county.

KENTUCKY.—Louisville.—Plover and sand snipe shooting is to be had at Goose Islands below the bridge. Quail are reported very plenty in Todd and the adjoining counties of Southern Kentucky.

## Yachting and Boating.

BOATS AND YACHT-BUILDING.—  
4th Paper.

THE "SKIP-JACK" MODEL.

THE "skip-jack" is a connecting link between the skiff and the round-bottom boat, and is more easily built than the latter, as it has no bent timbers, and the planking is put on without the trouble of shaping. Boats of this model row easily, and sail well, as the bow is sharp and consequently prevents "pounding" in a sea-way. It is a build of boat not often seen, and but little known, but I would recommend it strongly in preference to either a scow or skiff; especially if rough water is to be encountered. Some years ago, a member of the New York Yacht Club is said to have won the prize at the annual regatta with a yacht built on this plan. In the construction of this boat we introduce, for the first time, a keel, showing its connection with the stem, and stern; also cross-timbers, or ribs, and fore and aft planking. We will first consider a row-boat, sixteen or seventeen feet long, four feet wide and sixteen or seventeen inches deep at midship section. Diagram 5 gives the general shape of boat; one side

represents the bow of boat, the other the stern: this diagram also shows the shape in which the side-boards are cut. These side-boards are twelve inches wide, one-half inch thick, and of sufficient length, curved from the middle toward the ends. The end of board designed for the bow of the boat, is left four inches wide, the other end being six. The curve on side-boards is easily marked, by so bending a strip of board one inch square, that it will give the curve wanted. The curved edges of the side boards are beveled, the bevel not being uniform, as it is greatest at the widest part of board, diminishing to the bow-end, where the bevel runs out. Diagram 6 shows

bevel at mid ship section. The keel is of oak, one and three-fourths inches square. The length of keel depends somewhat (more or less) on the rake of stern post, and also on the curvature of the stem. The stem may be cut out of a "knee," and joined to the keel, as shown in Diagram No. 7; this is the strongest and best way. If the foot of the stem is not much "rounded" it may be shaped as shown in Diagram 8; or, it may be "built up" as shown in No. 9. The dotted lines in the dia-

grams show the places to cut the "grooves" for ends of plank. The stern post is of the same thickness as keel—one and three-fourths inches. The stern "deadwood" should be one and three-quarter inches thick, shaped and put together, as shown in Diagram 10—dotted lines showing grooves for

planking. The angle to cut grooves at top of stem is found as explained in Diagram 1, in the paper on the skiff. From the top of stem, the angle of the grooves diminishes to the bot-

tom, or foot, where it joins the keel, and the upper edges of the keel are beveled to correspond to the different angles which the "ribs," or cross timbers, make with it. The bevels on keel are continuations of the grooves in stem and stern timbers, and the planking is fitted to the various grooves and bevels with a square edge, or nearly so. Diagram 11, shows the

stem and stern post fitted to the keel, also the "stocks" on which the keel is fastened. The stocks consist of a straight edged plank, two inches thick, set on edge and fastened to the floor or bench. A mould board is cut and used as before directed. The side boards are fastened to the stern board and stem; the lower edges of side boards at midship, being four inches above the keel. Ribs, three-fourths of an inch thick, ten or twelve inches apart on keel, and require more or less beveling. The best way to find the bevels required is to cut the ribs to their proper lengths, and set them in place; the bevels are then found by placing a straight-edge on the ribs from one to another, and the amount of bevel required, will be at once seen. After the ribs are beveled and fitted, they are fastened on to the keel, their outer ends being joined to the sideboards by knees, cut to the proper angle and fastened to the side of ribs. The bottoms may be fastened on the keel alongside each pair of ribs, or they may be placed on the keel half way between them. The rib, knee, and bottom, are shown in Diagram 6. Small notches are cut on the under side of ribs and bottoms to allow water to pass freely to the "well," or opening left in the floor for bailing. NAUTICS.

[TO BE CONTINUED.]

NEWPORT—Aug. 25.—Race for an elaborate prize presented by Mr. J. Grinnell, Commodore of the Central Hudson Club, of New Hamburg, N. Y. The course was from an imaginary line drawn from the southwest corner of Long Wharf to Goat Island, north to and around Dyer's Island buoy, south to and around the can buoy at the south end of the torpedo station; north to and around the buoy at Bishop's Rock, south to and around the can buoy at the south end of the torpedo station, and thence north to the finish at the starting-line, a distance of twenty miles. All the buoys were left on the port in turning, and Rose Island was also left on the port in passing. Wind fresh from south-southwest.

The result was as follows:

| Boat.         | Owner.                          | Actual time. |       | Cor. time. |       |    |

SARATOGA SINGLE-SCULL RACE.—The three miles single-scull race on Saratoga Lake last Tuesday was contested by Chas. E. Courtney, of Union Springs, N. Y.; James Riley, of Staten Island; and Fred. Plaisted, of New York. Courtney led at the half mile and Plaisted was ahead at the mile. Plaisted and Riley fouled, but all three reached the turning-point nearly together, Riley then gaining the lead. Courtney won the race by three lengths in 20m. 47 $\frac{3}{4}$ s. Riley came in second.

NEW JERSEY—Newark Bay, Aug. 27.—A race open for sloops and cat-rigged boats was sailed over a course extending from Bonnel's boat-house, Greenville, around Beacon Light, to and around stake-boat off Willow Haven dock. Course sailed over twice; whole distance, ten miles:

|                  | Actual time. |       | Cor. time. |       |

| Charlie G.....   | 2            | 39 10 | 2          | 39 10 |
| Sallie Jane..... | 2            | 48 20 | 2          | 45 30 |

The first prize, a gold anchor and compass combined, awarded to Telegraph; second prize, a silver cup, to Wave; third prize, a gold anchor, to Willie R.

MAINE—Portland, Aug. 24.—The races for the challenge cup, for sloops and schooners of the Yacht Club of the second class, were sailed over a course of 15 miles. In sloops the George, the present holder of the cup, won in 2 hours and 53 minutes 25 seconds. In schooners the Undine won in 4 hours 42 minutes 4 seconds, and retains the cup.

MICH.—Port Huron, Aug. 25.—The Port Huron Yacht Club—I know not why it is dignified by the name, as all the so-called yachts are but mere cat-boats—seems to be dying a natural death. Can not a missionary be sent to this benighted city? Tug races are, however, popular. The Junior Commercial man is on an exploring expedition to the wilds of Lake Michigan, Chicago, etc., with a catamaran. Hartman will tell you all about it when he gets back. AUGUST.

A FIVE-MILE SCULLING MATCH.—Articles of agreement between Evan Morris, the champion, and Pat Luther, for a five-mile scull race for the championship and \$2,000, were signed 27th. They differ from the Morris-Scharif articles in the provision that each contestant shall turn his own buoy. Oct 13 is named as the date of the race, and Hulton course, on the Allegheny River, 13 miles above Pittsburgh, as the place.

RESOLUTE BOAT CLUB.—The first annual regatta of this club was held on the Hudson, near Carmansville, Aug. 25. Summary: Junior sculls race, one mile, with a turn. Entries: F. Baker, W. B. Peet, J. Wheelock. Wheelock, 8m. 40s.; Peet, 9m.

Four-oared large race, same distance entries: The Punch, manned by J. R. Folsom, M. Brown, M. Williamson, W. G. Foster, S. P. Weir; the E. S. Whitman, manned by M. Aitkin, F. Baker, C. Brock, A. Mills, S. Hawley. Won by the Whitman, by one boat's length, in 7m. 16s.

The regatta was concluded with a gig and punt race.

HUDSON RIVER YACHT CLUB.—An attempt was made last Monday to conclude the unfinished regatta of this club, but owing to a lack of wind the race was again postponed.

MASSACHUSETTS—BEVERLY YACHT CLUB—Cotuit Port, Aug. 21.—The thirty-fourth regatta for second-class yachts was sailed over a course of six miles as follows:

| SECOND CLASS.  |                         |         |            |           |       |

In this class only Edith, Rose and Brenda got off within time, the others all started after the time was up, and so lost the difference; Nora and Midget losing one minute, Bessie and Frolic two, and Bluebell three and a half. In the second-class Iida also lost a minute and a half.

The third class race was not made in time, and was resailed the following day. Course—From the judge's yacht off Curtis' Point, rounding Chappel's Ledge buoy and buoy No. 10 off Misery Island and return, five and a half miles south-southeast.

## W. W. Greener's CHOKE-BORE GUNS.

Tried on Game in America.  
Supplied by H. C. Squires, 1 Cortlandt St., NEW YORK.

### See the Following Testimonials:

SIR—It is a pleasure for me to inform you of my high appreciation of the 10-lb. Greener breech-loader purchased of you last winter. I consider it most boring, if skillfully done, as the greatest improvement in fowling-pieces since the introduction of the percussion cap. It gives the maker complete control of the pattern, and greatly increases penetration. To prove this, I will give you the performances of this gun. The 32-inch 10-gauge barrels, charged with 4½ drachms of powder and 1½ oz. No. 6 English chilled shot, give patterns ranging from 285 to 330 pellets in 30-inch circle at 40 yards. The same charge of powder and 1½ oz. No. 4 American shot gives 160 to 175 pattern, with penetration which kills ducks at 50 to 75 yards like a stroke of lightning. It is a characteristic of the choke-bore to show its greatest superiority in the large sized shot. What I am about to say will perhaps surprise you as much as the performance surprised me. On trial of the 12-gauge 28-inch modified choke-bore barrel, with 3½ drachms of powder and 1½ oz. of shot, I got about the same pattern and spread of shot at 25 yards as with the full choke 10-gauge barrels at 40 yards, with tremendous penetration. This is just the performance required of a gun for duck cover, in which you generally find ruffed grouse, woodcock and quail, these birds being killed, with few exceptions, at from 15 to 25 yards.

COL. JOHN BODINE.  
SIR—The guns arrived all right. We think these last guns you have sent us will place the Greener guns ahead of any other in this country, as guns of other makers don't compare in shooting qualities with them. We most highly commend the Greener as far superior to any gun of foreign or domestic manufacture that we have seen. We say this after seeing and using guns of all the most celebrated makers.  
CARLISLE, JONES & CO.  
SEMA, Ala.

The Greener gun presented by Mr. Squires for the best pointer, and awarded to me, is a close, clean, hard hitter, killing its game at very long distances. It is the second Greener that I have owned and it beats the first in every respect. I can win with them at the trap or in the field.  
L. A. K. CITY, Minn.  
S. B. DILLEY.

SIR—I have a pair of W. W. Greener's breech-loaders (bought of H. C. Squires, of New York), modified choke-bore. I have had an opportunity to test these weapons on birds heavily feathered, and where great penetration was essential to success. I have repeatedly made long shots, always killing the game clean. At a target both guns made a very even distribution of the shot, with extreme penetration.  
F. C. FIELD.

SIR—The Greener breech-loader I purchased of you is very fine indeed, and gives great satisfaction.  
WARREN, Pa. ROBERT DENNINGSON.  
W. W. GREENER, St. Mary's Works, Birmingham, England.

ANY GENTLEMAN who has not received a circular containing this cut, should write for one with new price list.

HAILEY, North Fort, Long Island. Aug 30 4t

### The Kennel.

## EMPIRE STATE KENNEL, BROOKLYN, L. I.

BEILLE-KUFUS. We are now looking orders for blood-red Irish setter puppies, whelped Aug. 15, 1877, out of our red Irish setter bitch Belle (Price winnings: Second at Mineola, L. I., and Centennial medal and diploma), by Arnold Burges' champion Rufus.

These puppies (eight dogs and three bitches) are the handsomest we have ever seen; they are all red, with no white, and, in appearance, like their sire. Kufus is one of the best bred and handsomest dogs in the country, and winner of more show prizes than any other Irish dog, having gained three abroad and six in the U. S., including the Irish championship at New York (beating Elcho) and stock dog cup. Kufus is the sire of the following noted prize winners, all of one litter: Rufus II, Centennial Irish champion; Rory O'More, 1st New York (beating the get of Elcho and Plunkett); Fire Fly, 1st Champion and 2nd New York; Kelpie, 2nd Centennial; and Fanchon 1st Kansas City. Belle is very handsome, being the heaviest feathered bitch in America. She is thoroughly broken on all kinds of game. For price, etc., address FISHER & BICKERTON, 179 Flatbush Avenue, Brooklyn, L. I. Aug 23 4t

**TROUT FISHING!**

**The Wisconsin Central Railroad THROUGH TO LAKE SUPERIOR.**

EXCURSION TICKETS from Chicago to Ashland and return for \$20 are sold at 63 Clark street, or the C. M. and St. Paul, Madison Street Depot, Chicago; also at low rates from Milwaukee. Dogs, guns and camp equipage taken free. The points of attraction to sportsmen on this "Forest and Stream" route are Menasha (Dota Island) for bass fishing; Butternut Creek and Lake for muskellunge; the many branches and lakes of the Flambeau and Chippewa rivers; trout runs with bass, pike and pickerel, never till this season fished by sportsmen. Between Silver Creek and Ashland are trout streams, and many others can be easily reached along the shore from Ashland or Bayfield, while rock fishing and trolling in the Bay offers excellent sport.

The new hotel at Ashland, the "Chequamegon," will be opened in July. Meantime there is accommodation at the smaller houses.

Steamers from Ashland to all Lake Ports.

HENRY PRATT, General Ticket Agent, 175 3m Milwaukee, Wis.

**THE "FISHING LINE."**

**Brook Trout Grayling and Black Bass Fisheries**

OF NORTHERN MICHIGAN, VIA

Grand Rapids and Indiana Railroad.

(Macquinn, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly or trolled a spoon in the waters of the Grand Traverse Region will come again without solicitation. All other lovers of the fish are invited to try these waters, wherein the fish named above, as also Muscogelone, Pike and Pickerel, abound.

In no other streams east of the Rocky Mountains is the famous American Grayling found in such numbers.

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.

The sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourists' Guide, containing full information as to Hotels, Boats, Guides, &c., and accurate maps of the Fishing grounds, send to Forest and Stream office, or address

J. H. PAGE, G. P. & T. A., Grand Rapids, Mich.

A. HOPE, Eastern Passenger Agent, 116 Marks Street, Philadelphia.

## Gunpowder.

# ORIENTAL POWDER MILLS

## Lafin &amp; Rand Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

## Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

## Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6 1/2 lbs. each, and canisters of 1 and 5 lbs. each.

## Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFFG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs. and 6 1/2 lbs., and in canisters of 1 lb. and 3/4 lb. All of the above give high velocities and less residuum than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World." BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS. MI ITARY POWDER of all kinds on hand and made to order. Safety Fuse, Frictional and Platinum Fuses.

Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

## THE HAZARD POWDER CO. MANUFACTURERS OF GUNPOWDER.

## Hazard's "Electric Powder."

No. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

## Hazard's "American Sporting."

No. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

## Hazard's "Duck Shooting."

No. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle breech-loaders.

## Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/2 lbs. and cans of 5 lbs. FFFG is also packed in 1 and 3/4 lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

88 WALL STREET, NEW YORK.

## THE New Dittmar Powder.

## THE CHAMPION POWDER OF THE WORLD

For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequalled for rapid firing, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address

CARL DITTMAR, NEPONSET, MASS.

New York, July 10, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Please say, for the information of some of my friends who may be misled by current statements, that I am still on the same powder for all out-door shooting, which I have used for several years past, never having risked the use of the nitrated powders except when shooting in a confined space in doors, when the smoke from any regular powder would produce a small rather offensive to some people, and cause somewhat greater obstruction to vision.

CAPT. A. H. BOGARDUS,  
Champion Wing Shot of the World,

## Gunpowder.

## Warren Powder Mills,

MANUFACTURERS OF

BLASTING AND MINING, SHIPPING AND SPORTING GUNPOWDER.

## Sportsmen's Goods.

## BOSTON

## SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS &amp; SON,

BOSTON.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest, and choice of either cap with hawlock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

## OUR PATENT DECOYS

have entirely superseded the old-fashioned cumbersome, wooden decoys. The birds are hollow, and six of them occupy about the space of one wooden decoy. The Duck Decoys of all kinds are \$12 per dozen: geese, \$3 each; yellow leg, \$4.25 per dozen; black breast plover, \$3.75 per dozen; red breast plover, \$3.75 per dozen; golden plover, \$3.75 per dozen; turnstone, chicken plover, etc., \$3.75 per dozen; sandpipers, \$3.50 per dozen. We are now making standing geese for field shooting.

## THE HUNTER'S TENT

is made of tan-colored duck; light, easily transported. Size, 7 ft. by 8 ft. Price, \$10 complete, made on the umbrella principle, folding into a neat roll 3 feet long.

In the judges' report at Philadelphia they were commended for excellence in every part. Very novel and practicable; adapted to all out-of-door purposes where lawn, beach, hunters and camp tents are used; quick folding; all sides strongly fortified; enables them to stand against wind and rain. Rev. F. B. Savage, of Albany, N. Y., who camps out in Florida in winter, and the Adirondacks in summer, writes this about the tents:

ALBANY, July 31, 1877.

Sirs—I have just returned from a three-weeks' camping expedition in the Adirondack, and have had the three tents bought of you put to the severest tests of exposure both as to wind and storm, and I do not unhesitatingly say they are the most complete thing of the kind I ever used.

1st. They are easily put up or taken down.  
2d. They are perfectly waterproof.  
3d. They are a good height, and all the room is available.

Our party asked for no better. They were admired by all who saw them, and one party insisted on buying one of ours that was to spare. Rev. Dr. Duryea, of Brooklyn, and the Rev. Dr. Irwin, of Troy, both indorse what I say about your tent. With kind regards, yours truly,  
F. B. SAVAGE.

## Tan-Colored Leather Pliable Waterproof Suits.

In Shooting Coats, Jackets, Breeches, Vests and Hats at following prices: Coats, \$22; Breeches, \$15; Jackets, \$13; Vests, \$12. These form the most elegant shooting equipment known. They are indestructible.

A recent notice in the FOREST AND STREAM, from a correspondent, says:

Whenever a sportsman, or even one who does not claim the distinction, finds a really good and useful article, it is no more than fair that he should let others have the benefit of his knowledge. For this reason we would call attention to the Tan-colored Leather Shooting or Fishing Suits, made by G. W. SIMMONS & SON, of Boston, Mass., the manufacturers of the famous "Boston Shooting Suit."

I saw these goods advertised in your paper, and wrote to the parties for samples. I found the material as soft and pliable as a piece of kid. I tested it by soaking in water twelve hours, and found it as nearly waterproof as one could desire, and after drying was happily surprised to find it had not stiffened in the least. I have since then received a full suit—coat, vest and breeches—ordered by letter from measure taken by myself.

The goods are splendidly made, well lined with flannel; in fact I do not see how they can be improved.

My friends are unanimous in their verdict that G. W. Simmons & Son's leather goods cannot be excelled in quality or beaten in price.

is really wonderful. Illustrated catalogue mailed on receipt of postage of four cents.

ESTABLISHED 1840.

## Gale's Patent Tents,

Adapted to all purposes where Lawn, Beach, Hunters and Camp Tents are used; are eight feet high, seven feet square at bottom, will lodge four persons; can be set up or taken down and packed in five minutes, making a bundle four feet long, of twenty-five pounds weight. The pole in two parts, is joined together by a brass tube. They are wonderfully light, and yet very strong, and are the handiest and cheapest tents extant. Samples of goods and price list sent free, and the tent sent on receipt of price, for C. O. D. Prices from \$10 to \$15.

GALE &amp; CO.,

Boston, Mass.

Painting.

## PAINTING.

EVERY ONE THEIR OWN PAINTER.

50 Per Cent. Saved.

We are manufacturing a very fine Pure Ready-mixed Paint, mixed in such a manner that any ordinary stable or farm hand can make as good a job of painting as a painter can with paint mixed in the old way. This is because our paint does not set quick, and thus show marks of the brush. We sell it lower than materials can be bought in the ordinary way, and pay freight in certain sized orders.

Any gentleman wishing to paint up his buildings at small expense, had better write, and have sent free our book.

Address 260 Front street,

INGERSOLL PAINT WORKS.

[Extract from FOREST AND STREAM, New York, December 26, 1876, Contributed by one of the Judges of  
Awards of Guns at the Centennial:]

"This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must  
rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on  
every gun. Costs about \$10 extra. Choke-bored, medium or full. Our guns to be had of the principal  
dealers in the trade only.

PREMIER GUN WORKS, Birmingham, England.

## Paper and Metallic Shells

FOR

## Breech-Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

BERDAN'S PATENT  
SOLID ANVILSTURTEVANT'S PATENT  
MOVABLE ANVIL

THE STURTEVANT SHELLS are the easiest reloaded.  
Do not have to unscrew the head nor use an awl to remove  
the exploded caps. THE PATENT MOVABLE ANVILS,  
made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with  
Hobbs' patent waterproof primers, never miss fire, and are  
highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great  
outlay for improved materials, and machinery made ex-  
pressly for the purpose, we can now warrant our BROWN  
PAPER SHELLS equal to any imported. They are sure  
fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for  
the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers.

## "St. Louis Conical Base Paper Shell."

ST. LOUIS  
CONICAL BASE SHELL

Having made important improvements in our Shell, we  
can safely recommend them as equal, if not superior, in  
quality to any Paper Shell manufactured in this country or  
in Europe.

Among the advantages claimed for these Shells, are: A  
saving of 25 per cent. in the use of powder; also the great  
decrease in recoil. The sizes made are No. 10—2½, 2½,  
and 3 inches; No. 12—2½, 2½, and 2½ inches. Longer  
for No. 12; \$1.30 for No. 10.

Shells will be made at extra cost. They are not malleable. Sample, 100, sent by express on receipt of \$1.15  
for No. 12; \$1.30 for No. 10.

Factory and office, No. 2,239 De Kalb street, St. Louis, Mo.

St. Louis Patent Shell Manufacturing Company.

## Capt. Bogardus' Patent Glass Ball Trap and Rough Balls.

These Traps and Balls patented by Bogardus and used by him many  
thousand times, proves them to be just what is wanted by all

SPORTSMEN'S CLUBS AND AMATEURS.

THE PATENT ROUGH BALL.—The only Ball that will break sure  
when hit by shot. Use none but the best. Every ball marked. Patented  
April 10, 1877; Traps, March 13, 1877.

Geo. E. Hart &amp; Co.,

NEWARK, N. J.

TRADE SUPPLIED.

HUBER &amp; MERWIN'S CHAMPION BALL TRAP.

We call the attention of the fraternity  
to the above trap, claiming to be the  
best in the world. It combines compactness  
with durability, and is arranged, by a  
swivel on the bed-plate, to throw a ball  
in any direction or at any elevation un-  
known to the shooter, a screen prevent-  
ing his seeing the direction in which the  
trap is set.

The spring, as the cut will show, is  
made of a steel rod or wire, bent spirally  
at the point of attachment, thus receiving  
the concussion its entire length, and pre-  
venting breakage.

FOR SALE BY

BARTON &amp; CO., Sole Agents,

337 BROADWAY, NEW YORK.

This certifies that I have used every trap in market, and find the CHAMPION GLASS BALL TRAP,

for durability and perfection of its operation, superior to them all, and take pleasure in recommending  
the "Champion" to sporting clubs and my friends. (Signed)

Ten Cents a Copy.

NEW YORK, THURSDAY, SEPTEMBER 6, 1877.

Volume 9.—No. 5.  
No. 111 Fulton St., N. Y.

#### WHEN MAIDENS SHOULD LOVE.

[From the Spanish of Gongora.]

Spring-time passes fleetly, maidens,  
Spring-time passes fleetly.

MAIDENS, in our village home,  
Prattling ever thus so boldly,  
Be wary lest the time should come  
When age and trust shall treat you coldly.  
Fear to let youth's giddy hours  
Wile to over fond believing,  
For with cast and faded flowers  
Time his garlands still is weaving.  
Spring-time passes fleetly, maidens,  
Spring-time passes fleetly.

Lightly flit the years away,  
While, on eager pinions pressing,  
Harpies watch, and as their prey,  
Snatch from us each choicest blessing.  
The bloom, that but a day endures,  
Of truth like this gives ever warning.  
As evening's chilling light obscures  
The charms that opened with the morning.  
Spring-time passes fleetly, maidens,  
Spring-time passes fleetly.

Take heed lest, when your fancies ween  
Of dawning's chimes they hear the greeting,  
Far other call life's peal should mean,  
And warn of night, and time's retreating.  
Then, bereft of beauty's glow,  
Lost your gentleness and graces,  
Your winning charms no more shall show  
Themselves as first in all our places.  
Spring-time passes fleetly, maidens,  
Spring-time passes fleetly.

An aged dame I've known, whose face  
Once was sweetly soft and blooming,  
Though now 'twere hard such charms to trace  
Through coat of false enamel looming.  
For her painted cheeks and brow,  
O'er which love's smile no longer twinkles,  
Show like bishop's surplice now,  
Puckered into folds and wrinkles.  
Spring-time passes fleetly, maidens,  
Spring-time passes fleetly.

And yet another dame I know,  
Who had but one sole tooth remaining,  
And saw it sink, some days ago,  
Within a posset she was draining.  
Then, walling thus, she cried—Oh, tooth!  
That long my soul has loved to cherish,  
A pearl I knew thee in thy youth,  
A worthless wail I see thee perish.  
Spring-time passes fleetly, maidens,  
Spring-time passes fleetly.

This lesson, hence, fond maids unfold,  
That ere cold, niggard age bereave you  
Of all your locks of ruddy gold,  
And but the pearl's gray lustre leave you.  
Thy yours to seek while you are sought,  
And love while you are ripe for wooing,  
Lest luck's bald hind-head set at naught  
The clutch of tools too late pursuing.  
Spring-time passes fleetly, maidens,  
Spring-time passes fleetly.

—G. in the Edinburgh Scotsman.

For Forest and Stream.

#### Pencillings at Devil's Lake.

AS Kit North dons his Sporting Jacket, he observes that "there is a fine and beautiful alliance between all pastimes pursued by flood, field and fell." So, too, each should add its charms to a sport pursued by either of the others. The fragrance of purple clover, the beauty of wooded shores, illumined by bursts of sunshine on those cloudy days loved by all anglers, contribute to the piquant enjoyment felt by the true sportsman as he sees far out from his skiff the frantic leap of the hooked bass or pickerel. The thrill caused by a fierce tug upon a rod is doubly relished, when the music and tremor of the running reel come to one who has been prepared to enjoy them by a beautiful landscape. The gray fields where keen dogs start the whirling covey of quail, lie among hedge-rows, single trees, groves and forests rich in autumn colors, and blessed, it may be, with the sparkle of lake or river. Shooting on real prairie is comparatively monotonous, and so

is fishing out of sight of land. That sport is best which can be pursued among the combined beauties of forest and stream, and such sport may be found at Devil's Lake in Southern Michigan, about fifteen miles west of Adrian and ten miles north of Hudson on the Michigan Division of the Lake Shore Road. The stage which runs from Hudson north to Coontown leaves the *voyageur* within two miles of the lake, and mine hosts, Terpency and Morley, landlords of the two dugy hotels of Coontown, will give him good accommodations. The lake is about four miles long and one mile wide, and innumerable camp-meetings, celebrations and picnics have combined with its natural beauty and excellent fishing to make it a public favorite. According to the lectures of General Cass, it was in 1760 the headquarters of a large branch of the tribe of Ottawa Indians. Pontiac, the Indian Napoleon, occasionally visited them, and there yet remain faint traces of the deeply worn trail which led to the French Post, then established at Detroit. The scars, found by the first settlers, upon the old maples thickly scattered over the region, the discovery of old brass kettles, the plowing up of numerous knives, stone hatchets, axes and arrow heads indicate that the Ottawa was numerous. Doctor "Jo" Welch, of Hudson, champion wing shot of the State, has a large collection of these relics, including stone hammers, pipes, spear-heads, drills and skinning instruments, together with iron knives stamped with a Greek cross—the early trademark of the Franciscan monks. The Devil's Lake tradition was well known to Joseph Beal, a recently deceased centenarian of the vicinity. He had befriended the savages, receiving substantial proof of their gratitude in the form of occasional wild turkeys and saddles of venison. He kept tobacco and pipes in his log cabin, and under the influence of the genial weed, several of the Indians had related the tradition, and freely answered his numerous questions. Long before its occupation by the Ottawas, the lake was known among the Indians as "Honey Water," and a great chief lived there with a numerous tribe. Game and fish were abundant, the maples yielded sugar, wild bees swarmed among the forest flowers, and were traced to ample stores of honey, while the banks of the birch-treed brooks shielded the mink, otter and beaver, whose furs enriched the couches of the wigwams. The chief's daughter had been presented with a canoe by the tribe, in the construction of which many rude but loving hands had assisted; the birch sides were inlaid with shells, the walnut paddles were carved with strange figures, and its happy owner loved to float far out on the lake at evening. One night, this canoe, propelled by an invisible power, came swiftly to the village beach at sunset, and instinctively the chief knew that his daughter was drowned. After a fruitless search for her dead body, the grief-stricken chief drowned himself in the waters as the first sunlight of the morning was gilding their surface. Now civil discord arose, as the braves fought for the vacant chieftainship; but in the midst of this deplorable strife, several Indians rushed wildly into one of the camps with the startling intelligence that on a bluff at the east side of the lake appeared a ghostly wigwam, and that Michi-Manitou, the Spirit of Evil, had doubtless reared it there for some purpose which could bode only evil to the tribe. The braves assembled in council, when ten warriors were appointed to examine the bluff. Crouched fearfully behind the protecting trunks of trees, the exploring party watched, until, at nightfall, they suddenly saw tongues of fire issuing from the lake, and the Evil Spirit, veiled by a thick smoke, presently emerged and disappeared in the heavy forest. Fairy music and hideous laughter and song were heard all night upon the crown of the bluff; but at daylight, the spirit returned to the deep water, and none of the frightened beholders could describe him. That morning one of the girls of the tribe attempted to cross the spot with a deer she had killed, and was taken from her boat to grace the Evil Spirit's submarine lodge. The Indians were terrified; a supernatural power wanted their maidens, their game and their fish, and they named the lake Michi-Manitou and left its beautiful but dangerous waters far behind them. And the forest around it remained deserted for many hundred moons, until Pontiac established there a village of Ottawas. But the lake is still waiting for some Irving or Cooper to perpetuate its story. Michi-Manitou has not yet been described; no Wordsworth or Southey has celebrated its beauties in verse where the eye travels delighted over the pastures and wheat fields that melow to the reedy margin of the water. Many fish are caught

through the ice in winter, and in summer the spear is used in defiance of the laws. The rudest angler is almost sure of good sport, yet there are localities known only to a favored few where the fishing is superb. During a stiff breeze, and while there was running a very heavy sea for the oarsman in a light skiff, and anchored in twelve feet of water, the writer caught forty-six large bass in two hours and a half. The black bass is a fastidious fellow; he likes live bait—minnows—and is alarmed by a large line. Fine silk lines of a dark gray seem to answer very well, but the hooks should be large and perfect, as the struck fish often leaps three feet from the water, which he churns into foam-bells as he bounds blue-white into the air, in a desperate effort to shake himself loose. Little Will, an eight-year-old nephew, lost a monster fish this summer by reason of a defective hook, and he is inconsolable. At Devil's Lake, all classes meet on equal terms; the place is democratic. Yonder bright-eyed boy, who safely lands a bass in his skiff with a yell of delight, is a Hillsdale College student, familiar with logarithms, the Greek verbs and evolution. The bronzed man quietly eating his lunch under an enormous straw hat, by the iron Spring in Willett's Cove, is an Adrian banker, whose check is good for a hundred thousand dollars. That apparition in a woolen shirt and brown "overalls" may be a merchant and Legislator, who has swayed Senates and managed the Michigan finances, an attorney who has in charge the legal affairs of great corporations, or a farm laborer who cannot read or write.

But darkness has caught us with pencil yet in hand. "Rome"—short for Romeo—our companion in sport, shouts that supper is ready. He has filled his eyes with smoke while making the damp leaves of the woods kindle a fire, whose ashes now yield baked potatoes. Green twigs make good toasting forks for the slices of ham, and the bread and cheese are washed down with liberal drafts of cider from the little brown jug. Truly this is a fine night! The wind is roaring in the tree-tops, and the waves are making a very respectable noise on the beach. Pounding down the bunches in our hay couch, we draw the buffalo robes over us and sleep soundly. Rome wakes at daylight and cries "Time!" Half-past three! Ye gods, what a miserably early hour for rising! A row of a mile in the gloaming takes us across to Darlington's Point, where we build a fire, eat a hearty breakfast, and rowing to the edge of blue water, let out the trolling lines into the heavy waves, tipped with white caps. The East is in all the glory of sunrise. Slaid old farmers, do ye know that one who could transfer this scene to canvas would be immortal; that the views, changing and retiring in their perfection as we enter Willett's Cove, prove that beauty has here pitched her tents? But a fish has struck one of the hooks, and his leap in the early sunlight, ten rods away, makes Rome tremble with excitement. The diamond drops fall from the oars, which are steadily plied mile after mile, until Pennocks is reached. It is not a good day for trolling, but as we pass Black Bass Point, two fine fish are taken. Regal, with its many crescents, the low-lying shores of the western part of the lake appear, and as we glide across a bar and let out the lines, it is 11 o'clock. Eight miles of rowing and but three fish! A mile along the north shore, then the edge of a line of rushes is followed, curving to the south; forty rods more, and we will have finished the circuit of the lake—but the right hand line straightens, then the left. Glorious! Here is a leaping bass on each hook! The oars are dropped for the first time, and two happy trollers each pull in a fish, one a gigantic fellow, the largest bass of the season.

A half day's rowing bring us to lunch with a sharp appetite, and during the heat of the day we will watch from the grassy bank the long flight of the cranes, and the circles of the many white-winged gulls, whose cries come faintly over the waters. But, hark! a far-off sullen rumble; the water grows still and black, and a hush is among the leaves. There, in the west, sweeps on the light-colored advance line of a heavy thunder-shower. The tree-tops yonder are bowing their heads in a strong wind; not a breath here yet—but soon there is a fast, thick pattering on the woods, and as the storm breaks over us, the lake shore tumbles with heavy waves displayed by the flashes of lightning. Secure in our shanty, we listen to the long roll of the thunder, and before the storm is fairly over, Rome has rowed us far out on the lake, whose rain-washed and sunlit eastern woods are crowned by the bow of promise. The rods are speedily adjusted, while we float on

the glassy water, as it were between earth and sky. For two hours we fish with good success, then a lovely sunset. The shadows are peaceful; the silence of night lulls to repose the lake, which, like another sky, seems to contain its own luminaries of moon and stars. But, so! The twang of oarlocks! Passing yonder, in the strip of silvery light, is a belated swain returning to Chandler's Landing, his lady love singing in time with the dip of the oars, as their skiff moves through the scattering rushes.

When we take the train for the East, we feel that one who has suffered a two-years' imprisonment in a busy city office, surrounded by stone walls and breathing an atmosphere of smoke and dust, may be excused for his enthusiasm over the attractions of this sheet of water, bluff-guarded, rill and spring-fed, forest-girdled, wide-winding, with its many coves and grassy banks; its pure air, green pastures and still waters;—beautiful Devil's Lake!

*For Forest and Stream and Rod and Gun.*  
**MY FIRST SALMON.**

FOR several years I have been satisfied with the different kinds of fishing to be found in New England waters, salt or fresh, but for the last year I have been growing dissatisfied with the opportunities offered here, partly through the stories I have read in your columns and elsewhere, but more particularly by the stories I have heard from such salmon experts as our good brother Bracket of the Anglers Association and Fred Curtis, Esq., of our city, the lessee of one of the best salmon streams in Canada, the Dartmouth. So some three or four months ago I determined that I would take my first salmon this year—if I could. With the assistance of the last-named gentlemen and John Hicksen, Esq., the courteous warden, I was enabled to get the refusal of what is called the rough-waters of the Nepissiquit River, emptying into the Bay of Chaleur at Bathurst, N. B., from the 25th of June to the 3d of July inclusive, an excellent time in the season.

My party was soon made up and consisted of A. G. Hills, of the Boston Journal, J. S. Ames of Norfolk, Va., Walter R. Adams of Ashburnham, Mass., and myself, all great lovers of the piscatorial art, but all like myself novices in the salmon branch of it.

Upon our arrival at Bathurst we were informed that the lessee of the Pappana district in this river would not in all probability fish this season, and as it was thought our chances for securing fish were much better in the upper waters than in the lower or rough waters, where it was arranged we were to get our sport, we placed ourselves in communication with him and were fortunate in securing this part of the river. At Bathurst we secured the necessary outfit, such as tents, potatoes, pork, flour, a French cook, etc., depending upon our rod and line for the luxuries. Sunday was spent in Bathurst in a quiet way. This town is situated upon two hills or bluffs overlooking the bay, which is rather the outlet of the River Nepissiquit. It is a very pleasant seaport town; its cool, bracing atmosphere quickly restores to health and vigor the weary, careworn business man. Fish and lumber are the great exports of this section. Just outside of Bathurst Bay may be seen a lobster canning establishment with large ships always in attendance during the season. In the town several artificial freezing houses have lately been erected, so that salmon, mackerel, linnet, etc., can be frozen immediately after being caught and kept, almost any length of time. It is almost unnecessary to say that arrangements were made for freezing a large quantity of salmon—to be taken by our party.

Monday morning we left Bathurst for camp, our road following the windings of the river to the Grand Falls its terminus. The latter part of this road could more properly be called a path, and it is extremely difficult to travel with horse and wagon. It was nearly six o'clock in the evening before we succeeded in getting anything to eat after our long and tiresome journey through a dreary and almost unbroken wilderness of spruce and pine. It had been an exceedingly warm and sultry day, just such a one as those in which black flies, mosquitoes and their larger brethren the moose fly, delight to prey upon the helpless humanity which ventures into their domain.

We fished but little for salmon that day, giving our attention to trout, which were wanted for camp duty. Supper over, the work of the morrow was laid out. It was decided that two of us should go up the river from camp, and the other two down. Our camp was pitched at what is called "Chain of Rocks," in about the centre of our fishing district. The great questions, who would get the first salmon? who the largest one? were to be settled. We expected on the morrow all of course would get some, but alas! there are uncertainties even in salmon fishing, for two of our enthusiastic brothers came into camp at night without their first salmon, tired, sore, sun burned and hungry; there were flies and mosquitoes, millions of them, where they had been. The other two came into camp as fresh as they went out; to be sure they were hungry and a little sore and they had seen a fly or two, but what cared they for those little things, the first salmon had been taken. They had taken more than one, four was the score of one, and two that of the other. They had seen the promised land, and it is said that after taking his second salmon which proved to be the largest one taken by our party, weighing over 22 pounds, one of the two expressed himself as supremely happy; didn't want to fish any more, was willing to go home satisfied.

The feelings of one with his first salmon upon his line (if he is a lively fish) are not easily described. Your fishing tackle is much larger and stronger than that used for trout or bass. You strike a fish that spins your large reel and your heavy oiled silk line, making a mere toy of it; then you for

the first time gaze upon what looks like a live block of silver, some four or six feet in the air, and perhaps two hundred feet away from you, and are told that that fish is upon your line; and after six of these leaps and as many more doubles he gradually shows his weakness; comes to the surface; turns upon his back; is finally brought to gaff, and you are assured that he cannot escape. Here is your first salmon before you, a fifteen-pound fish, conquered by your own hands, and with a little fly hook. If you do not call him the handsomest fish ever made; if you do not indulge in some lively expressions of joy and thankfulness that you were permitted to accomplish all this, then I pity you. There is some mistake, you are in the wrong world! The writer has enjoyed some little experience in taking many kinds of fish, but he must say there is a satisfaction, a fullness in bringing to gaff a salmon, such as he never experienced in taking any other kind of fish. There can be no question about it; he is the king of all fish and all other fishing pales before this. Never have we seen any testimony to the contrary. Let a sportsman once get a taste of this kind of sport, and if he have the time and means you will find him every year casting his "silver doctor," "silver gray," "fairy" or some other favorite fly fifty, sixty, seventy or perhaps one hundred feet just where he knows a salmon lies in the pool.

Salmon fishing has its drawbacks; it is very difficult to get an opportunity to fish in a good river during a desirable time in the season or when fish are running. It is quite an expensive pleasure, as each fisherman must have two men for his canoe. Salmon rivers are a long distance away, it takes time and money to reach them, and after you have reached them it sometimes happens there is no run of fish. Then, too, you must suffer more or less those pests, the flies. We had in our possession six different kinds of mixtures, each one recommended with the highest testimonials, and none of which were worth carrying into the woods. The only thing we found of service to us was a simple gauze net with an elastic at each end attached to our hat and running over the brim down to and under our shirt collar. This effectually kept the flies away from our faces, and the contrivance for our hands consisted of a linen sleeve commencing at the elbow with an elastic to keep it in place, covering the hand, leaving only the thumb and fingers. An improvement upon this we think would be to have the sleeve form a part of a glove covering the entire hand. We were indebted to our friend, Mr. Curtis, for the veil and sleeves.

But to return to our fishing. Tuesday, Wednesday, Thursday and Friday we had varying success, changing about, now up, now down the river until each had caught his first salmon. After the hard day's work away from camp, we found a dinner and supper all in one upon our return; then the exploits of the day were told over and over again around our great log fires and smudges. The novelty of these circumstances made us forget our hard work and gave a pleasant interest to our enjoyments. Two of our guides brought with them their violins. Imagine, if you please, four fishermen "balancing corners, right and left," around two large camp fires, whose bright lights cast fantastic shadows and shapes all about us; the forest all around us, not a habitation for miles, no note excepting that of the night hawk above us and the rushing of the water over the chain of rocks below us, and you may see us as we were encamped upon the banks of the Nepissiquit.

The study of the habits and peculiarities of fish of any kind must be very interesting to the student, but there are many simple facts interesting to all which are noticed by the lover of this sport as he is in pursuit of his game.

Salmon commence their annual ascent of the rivers where they were born about the first of June. Generally they make the journey, resting in the deep pools on the way, until they have completed the distance in about one week. Occasionally a school will make a journey in twenty-four hours. It is an established fact that these fish always return to the stream and place in the stream where they were born. Here the female with her nose digs a hole in the ground in shallow and swift running water and lays her eggs. She watches over the eggs until they are hatched and the young parr are able to care for themselves. She does this persistently, often showing so little regard for her own safety that she is easily speared or caught in other unlawful ways at this time. She never rises to a fly during this season.

Having completed their work they return to the sea and remain—in what part of it nobody knows—until another year rolls round. It is said a fish goes down stream head against the current, and that salmon return to the sea in the same way. The young fry remain in their native streams two years, when they too proceed to the sea, only about one-half returning to the river the fourth year, the other half the fifth; that is, some are absent one year, some two years.

There are always interesting incidents in connection with fish and fishing which only men who follow fishing as a business or pastime ever learn. One of the guides tells of a struggle between a large salmon and an eagle, of which he was an eye-witness. The story ran thus: When returning to camp one evening in the fall they noticed a large eagle hanging quite low over the water at no great distance from them. They at once knew that he was fishing for salmon, and waited in hopes to secure the fish after it had been caught by the bird. The eagle finally dropped upon his fish, but did not rise as usual, and thereupon commenced a fearful struggle in the water. At one time the eagle would be entirely submerged, and again he would appear out of water, spreading his large and powerful wings to fly, but all in vain. Below he

would go again, in and out, until he was finally drowned, both salmon and eagle being killed in their efforts to escape. It was found the bird had fastened his talons so deeply into the flesh of the large fish that he could not extricate them.

Saturday morning, June 30th, it was decided to break camp. After an early breakfast, and stowing away our camp utensils in our canoe, we commenced the descent of the river. In my canoe were placed the fruits of my previous day's sport, viz.: eight salmon weighing respectively 8, 13, 13, 12½, 12, 12, 8 and 10 pounds each, making 88½ pounds of fish for one day's catch. This was regarded as a remarkably good day's work for this stream, as the fish here are small compared with those in some other streams in Canada. Fish of this size afford, it is said, more sport in taking than the larger ones, as they are much more lively, and oftentimes make a half dozen leap out of the water before showing signs of weakness. Of the fifteen salmon taken by myself upon this trip, an eight-pound fish afforded me more sport and harder work to bring to gaff than any other one I landed. The largest one I caught, weighing twenty pounds and upward, never left the water after he was hooked, and I did not see him until a few moments before he gave out and was gaffed at my feet.

We were to fish down stream, and as the "high line" of our party, on the first day, had not taken a fish since, and it was known that two more fish were needed to fill his cup of happiness, the best chance for securing them was given him at "Middle Landing," and strange as it may seem, our knight of the quill caught his two fish there. They were also the only fish caught that day, although several were hooked and lost.

Sunday found us again in Bathurst, in the land of civilization once more, at the comfortable Hotel Wilbur, out of the haunts of black flies and mosquitoes. Here we had the pleasure of meeting our friend F. Curtis, Esq., of Boston, who had just returned for a few days rest after some remarkable fishing upon the Restigouche.

This fine river, probably the best in America, is rented in two divisions; the lower to Sanford Fleming, Esq., of Canada, the celebrated engineer and angler; the other to Hon. J. C. Brydges, of Montreal, Genl. Director of Govt. Railways. It was placed at the disposal of the Fishery Commission exclusively as long as they desired to occupy it. Sir A. T. Galt, of Canada, British Commissioner; Hon. E. H. Kellogg, of Pittsfield, Mass., American Commissioner; Hon. W. F. Whitteer, Fish Commissioner of the Dominion of Canada; Fred Curtis, Esq., solicitor and counsel in patent cases, Boston, Honorary Secretary; and Mr. John Galt, private Secretary to Sir A. T. Galt, composed the party, accompanied by Mr. John Mowatt, the genial and able Fishery Warden of that section. Sir A. T. Galt, Mr. Whitteer and Mr. Curtis had fine sport. Mr. Kellogg, although fishing for salmon for the first time, was very successful, killing some fifteen large fish in six days, but the score of Mr. Curtis for one day is probably unprecedented in fishing annals; it was thirteen salmon, averaging twenty-four pounds each, three of the number weighing over thirty pounds.

The party, after leaving the Restigouche, revisited the Mata-pedia as the guests of Mr. Geo. Stephen, of Montreal (the lessee of the stream), universally known throughout Canada as an accomplished angler, and large hearted and courteous gentleman. We also had the pleasure of meeting Dr. Kennedy, of Boston, and his friend Col. Pierce, of Springfield, Mass., who were bound for a few days fishing at Pappana Falls, some seven miles up the river, upon the Nepissiquit. The uncertainties of fishing were exemplified by an exceedingly unfortunate accident which happened to Judge Souther, of Erie, Pa., who had the misfortune, after having made the entire journey from Penn. to the Chain of Rocks, and before he had thrown a fly, to suffer a severe ankle sprain which incapacitated him for any sport.

Early Monday morning we were at the rough waters of Bathurst, and during the forenoon I landed three salmon, one grise and several large sea trout. While poling up stream in our canoe and in quite shallow water, the man forward suddenly cried out, "*Mon Dieu, voyez salmon!*" and struck with all his force at something in the water. Taking in the situation at once, I jumped up from my seat in the centre of the canoe, dropped my rod and cried, "Where is the gaff?" at the same time seizing it. In the meantime the fish had gone down and was struck at by the man in the stern and turned under the canoe and up stream, where a moment after he was taken from the water by the waiter with his gaff and landed safely inside the canoe. It was a fine fish, weighing just twenty pounds, and was a sight in the shallow and rough waters, trying to find the channel which he had for some reason lost.

One word in reference to packing our fish. Every other day we sent them to Bathurst and had them frozen, and at the last moment carefully packed in snow (much better than ice) and expressed upon the train with us upward of thirty fish and weighing about 400 pounds. Tuesday morning, July 3d, we joined our friends at that desolated city of St. John, and after breakfast took the only regular eastward train in twenty-four hours over E. & N. A. R. R. This is a long and tedious day between St. John and Bangor, where we arrived about six o'clock in the evening. Here we took car for Boston, and upon the anniversary of our Independence, amid the ringing of bells and firing of cannon, we arrived home.

I wish to tender for our party our acknowledgments to John W. Nicholson, Esq., of St. John, for the great privilege which he accorded us as his guests upon the Nepissiquit, of which he is lessee.

## INTRODUCTION AND SUCCESSION OF VERTEBRATE LIFE IN AMERICA.\*

By O. C. MARSH.

PRESIDENT OF THE BIOLOGICAL SECTION OF THE AMERICAN ASSOCIATION.

THE origin of life, and the order of succession in which its various forms have appeared upon the earth, offer to science its most inviting and most difficult field of research. Although the primal origin of life is unknown, and may perhaps never be known, yet no one has a right to say how much of the mystery now surrounding it science cannot remove. It is certainly within the domain of science to determine when the earth was first fitted to receive life, and in what form the earliest life began. To trace that life in its manifold changes through past ages to the present is a more difficult task, but one from which modern science does not shrink. In this wide field, every earnest effort will meet some degree of success; every year will add new and important facts; and every generation will bring to light some law, in accordance with which ancient life has been changed into life as we see it around us to-day. That such development has taken place, no one will doubt who has carefully traced any single group of animals through its past history, as recorded in the crust of the earth. The evidence will be especially conclusive, if the group selected belongs to the higher forms of life, which are sensitive to every change in their surroundings. But I am sure I need offer here no argument for evolution; since to doubt evolution to-day is to doubt science, and science is only another name for truth.

Taking, then, evolution as a key to the mysteries of past life on the earth, I invite your attention to the subject I have chosen: "The Introduction and Succession of Vertebrate Life in America."

In the brief hour allotted to me, I could hardly hope to give more than a very incomplete sketch of what is now known on this subject. I shall, therefore, pass rapidly over the lower groups, and speak more particularly of the higher vertebrate, which have an especial interest to us all, in so far as they approach man in structure, and thus indicate his probable origin. These higher vertebrate, moreover, are most important witnesses of the past, since their superior organization made them ready victims to slight climatic changes, which would otherwise have remained unrecorded.

In considering the ancient life of America, it is important to bear in mind that I can only offer you a brief record of a few of the countless forms that once occupied this continent. The review I can bring before you will be like that of a great army when regiment after regiment with full ranks moves by in orderly succession, until the entire host has passed. My review must be more like the roll-call after a battle, when only a few scarred and crippled veterans remain to answer to their names. Or rather, it must resemble an array of relics, dug from the field of some old Trojan combat, long after the contest, when no survivor remains to tell the tale of the strife. From such an ancient battle-field, a Schliemann might unearth together the bronze shield, lance-head, and gilded helmet of a prehistoric leader, and learn from them with certainty his race and rank. Perhaps the skull might still retain the barbaric stone weapon by which his northern foe had slain him. Near by, the explorer might bring to light the commingled coat of mail and trappings of a horse and rider, so strangely different from the equipment of the chief, as to suggest a foreign ally. From these, and from the more common implements of war that fill the soil, the antiquary could determine, by patient study, what nations fought, and, perhaps, when, and why.

By this same method of research, the more ancient strata of the earth have been explored, and, in our Western wilds, veritable battle-fields, strewn with the fossil skeletons of the slain, and guarded faithfully by savage superstition, have been despoiled, yielding to science treasures more rare than bronze or gold. Without such spoils, from many fields, I could not have chosen the present theme for my address to-night.

According to present knowledge, no vertebrate life is known to have existed on this continent in the Archæan, Cambrian, or Silurian periods; yet during this time, more than half of the thickness of American stratified rocks was deposited. It by no means follows that vertebrate animals of some kind did not exist here in those remote ages. Fishes are known from the Upper Silurian of Europe, and there is every probability that they will yet be discovered in our strata of the same age, if not at a still lower horizon.

In the shore deposits of the early Devonian sea, known as the Schoharie Grit, characteristic remains of fishes were preserved, and in the deeper sea that followed, in which the Coniferous limestone was laid down, this class was well represented. During the remainder of the Devonian, fishes continue abundant in the shallower seas, and, so far as now known, were the only type of vertebrate life. These fishes were mainly Ganoids, a group, represented in our present waters by the gar-pike (*Lepisosteus*) and sturgeon (*Acipenser*), but in the Devonian sea, chiefly by the Placoderms, the exact affinities of which are somewhat in doubt. With these were Elasmobranchs, or the Shark tribe, and among them a few Chimeroids, a peculiar type, of which one or two members still survive. The Placoderms were the monarchs of the ocean. All were well protected by a massive coat of armor, and some of them attained huge dimensions. The American Devonian fishes now known are not as numerous as those of Europe, but

they were larger in size, and mostly inhabitants of the open sea. Some twenty genera and forty species have been described.

The more important genera of Placoderms are, *Dinichthys*, *Aspidichthys* and *Diplognathus*, our largest Palæozoic fishes. Others are, *Acanthaspis*, *Acantholepis*, *Coccolepis*, *Macropetalichthys* and *Onychodus*. Among the Elasmobranchs, were *Cladodus*, *Otenacanthus*, *Machæracanthus*, *Rhynchodus* and *Ptychodus*, the last two being regarded as Chimeroids. In the Chenung epoch, the great Dipterian family was introduced with *Dipterus*, *Heliodus*, and possibly *Ceratodus*. Species of the European genera, *Bothriolepis* and *Loxopterygius*, have likewise been found in our Devonian deposits.

With the close of the Devonian, came the almost total extinction of the great group of Placoderms, while the Elasmobranchs, which had hitherto occupied a subordinate position, increase in numbers and size, and appear to be represented by Sharks, Rays and Chimeras. Among the members of this group from the Carboniferous, were numerous Cestracionts, species of *Cochliodus* of large size, with others of the genera *Heliodus*, *Helodus*, *Psammodius* and *Sandolodus*. Of the Petalodonts, there were *Antiodon*, *Chomatodus*, *Otenopterygius*, *Petalodus* and *Petalorhynchus*; and of the Hybodonts, the genera *Cladodus*, *Carcharopsis* and *Dipodus*. These Elasmobranchs were the rulers of the Carboniferous open sea, and more than one hundred species have been found in the lower part of this formation alone. The Ganoids, although still abundant, were of smaller size, and denizens of the more shallow and confined waters. The latter group of fishes was represented by true Lepidosteids, of the genera *Paleoniscus*, *Amblypterus*, *Platysomus* and *Eurypterus*. Other genera are, *Rhizodus*, *Megalopterus*, *Otenodus*, *Edesmus*, *Orodus*, *Otenacanthus*, *Gyracanthus*, and *Celaacanthus*. Most of these genera occur also in Europe.

From the Permian rocks of America, no vertebrate remains are known, although in the same formation of Europe Ganoids are abundant; and with them are remains of sharks, and some other fishes, the affinities of which are doubtful. The Palæozoic fishes at present known from this country are quite as numerous as those found in Europe.

In the Mesozoic age, the fishes of America begin to show a decided approach to those of our present waters. From the Triassic rocks, Ganoids only are known, and they are all more or less closely related to the modern gar-pike, or *Lepisosteus*. They are of small size, and the number of individuals preserved is very large. The characteristic genera are, *Catopterus*, *Ischypterus*, *Ptycholepis*, *Rhabdolepis* and *Turscodus*. From the Jurassic deposits, no remains of fishes are known, but in the Cretaceous, ichthyic life assumed many and various forms; and the first representatives of the Teleosts, or bony fishes, the characteristic fishes of to-day, make their appearance. In the deep open sea of this age, Elasmobranchs were the prevailing forms, Sharks and Chimeroids being most numerous. In the great inland Cretaceous sea of North America, true osseous fishes were most abundant, and among them were some of carnivorous habits, and immense size. The more sheltered bays and rivers were shared by the Ganoids and Teleosts, as their remains testify. The more common genera of Cretaceous Elasmobranchs were, *Otodus*, *Oxyrhina*, *Galuceroo*, *Lamna* and *Ptychodus*. Among the osseous fishes, *Beryx*, *Enchodus*, *Porteus*, and *Sauropneustes* were especially common, while the most important genus of Ganoids was *Lepidodus*.

The Tertiary fishes are nearly all of modern types, and from the beginning of this period there was comparatively little change. In the marine beds, sharks, rays and Chimeroids maintained their supremacy, although Teleosts were abundant, and many of them of large size. The Ganoids were comparatively few in number. In the earliest Eocene fresh-water deposits, it is interesting to find that the modern gar-pike, and *Amia*, the dog-fish of our Western lakes, which by their structure are seen to be remnants of a very early type, are well represented by species so closely allied to them that only an anatomist could separate the ancient from the modern. In the succeeding beds, these fishes are still abundant, and with them are Silurids nearly related to the modern cat-fish (*Pimelodus*). Many small fishes, allied apparently to the modern herring (*Clupea*), left their remains in great numbers in the same deposits, and, with them has been recently found a landlocked ray (*Heliodonts*).

The almost total absence of remains of fishes from the Miocene lake-basins of the West is a remarkable fact, and perhaps may be best explained by the theory that these inland waters, like many of the smaller lakes in the same region to-day, were so impregnated with mineral matters as to render the existence of vertebrate life in them impossible. No one who has tasted such waters, or has attempted to ford one of the modern alkaline lakes which are often met with on the present surface of the same deposits, will doubt the efficiency of this cause, or the easy entombment of the higher vertebrates that ventured within their borders. In the Pliocene lake-basins of the same region, remains of fishes were not uncommon, and in some of them are very numerous. These are all of modern types, and most of them are Cyprinoids, related to the modern carp. The Post-pliocene fishes are essentially those of to-day.

In this brief synopsis of the past ichthyic life of this Continent, I have mentioned only a few of the more important facts, but sufficient, I trust, to give an outline of its history. Of this history, it is evident that we have as yet only a very imperfect record. We have seen that the earliest remains of fishes known in this country, are from the lower Devonian; but these old fishes show so great a diversity of form and structure, as to clearly indicate for the class a much earlier origin. In this connection, we must bear in mind that the two lowest groups of existing fishes are entirely without osseous skeletons, and hence, however abundant, would leave no permanent record in the deposits in which remains of fishes are usually preserved. It is safe to infer, from the knowledge which we now possess of the simpler forms of life, that even more of the early fishes were cartilaginous, or so destitute of hard parts as to leave no enduring traces of their existence. Without positive knowledge of such forms, and considering the great diversity of those we have, it would seem a hopeless task at present to attempt to trace successfully the genealogy of this class. One line, however, appears to be direct, from our modern Gar-pike, through the lower Eocene *Lepidosteus* to the *Lepidodus* of the Cretaceous, and perhaps on through the Triassic *Ischypterus* and Carboniferous *Paleoniscus*; but beyond this, in our rocks, it is lost. The living Chimeras of our Pacific coast has nearly allied forms in the Tertiary and Cretaceous, more distant relatives in the Carboniferous, and a possible ancestor in the Devonian *Rhynchodus*. Our Sharks likewise can be traced with some certainty back to the Palæozoic; and even the *Lepidosteus*, of South America, although its immediate predecessors are unknown, has some peculiar characters which strongly point to a Devonian ancestry. These suggestive lines indicate

a rich field for investigation in the ancient life-history of American fishes.

The Amphibians, the next higher class of vertebrates, are so closely related to the fishes in structure, that some peculiar forms of the latter have been considered by anatomists as belonging to this group. The earliest evidence of Amphibian existence, on this continent, is in the Sub-Carboniferous, where foot-prints have been found which were probably made by Labyrinthodonts, the most ancient representatives of the class. Well preserved remains are abundant in the Coal Measures, and show that the Labyrinthodonts differed in important particulars from all modern Amphibians, the group which includes our frogs and salamanders. Some of these ancient animals resembled a salamander in shape, while others were serpent-like in form. None of those yet discovered were frog-like or without a tail, although the restored Labyrinthodont of the text-books is thus represented. All were protected by large pectoral bony plates, and an armor of small scutes on the ventral surface of the body. The walls of their teeth were more or less folded, whence the name Labyrinthodont. The American Amphibians known from osseous remains are all of moderate size, but the foot-prints attributed to this group indicate animals larger than any of the class yet found in the old world. The Carboniferous Amphibians were abundant in the swampy tropical forests of that period, and their remains have been found imbedded in the coal then deposited, as well as in hollow stumps of the trees left standing.

The principal genera of this group from American Carboniferous rocks, are, *Sauropsis*, known only from footprints, *Baphetes*, *Dendroperlepis*, *Hylonomus*, *Hyleperlepis*, *Rosieria*, *Pelon*, *Leptophractus*, *Molgophis*, *Ptyonius*, *Amphibamus*, *Coccylinus* and *Ceratoperepis*. The last genus occurs also in Europe. Certain of these genera have been considered by some writers to be more nearly related to the lizards (*Lacertilia*), among true reptiles. Some other genera known from fragmentary remains or foot-prints in this formation have likewise been referred to the true reptiles, but this question can, perhaps, be settled only by future discoveries.

No Amphibia are known from American Permian strata, but in the Triassic a few characteristic remains have been found. The three genera, *Diictycephalus*, *Displetor* and *Parios-tegus*, have been described; but, although apparently all Labyrinthodonts, the remains preserved are not sufficient to add much to our knowledge of the group. The Triassic foot-prints which have been attributed to Amphibians are still more unsatisfactory, and at present no important conclusions in regard to this class can be based upon them. From the Jurassic and Cretaceous beds of this continent, no remains of Amphibians are known. A few only have been found in the Tertiary, and these are all of modern types.

The Amphibia are so nearly allied to the Ganoid fishes, that we can hardly doubt their descent from some member of that group. With our present limited knowledge of the extinct forms, however, it would be unprofitable to attempt to trace in detail their probable genealogy.

The authors to whom especial credit is due for our knowledge of American fossil Fishes and Amphibians, are Newberry, Leidy, Cope, Dawson, Agassiz, St. John, Gibbs, Wyman, Redfield and Emmons, and the principal literature of the subject will be found in their publications.

(To be continued.)

AMERICAN BIRDS IN ENGLAND.—Apropos of the recent introduction of the European migratory quail into the United States (recently described in this journal) the London *Field*, in an editorial, says:

For several years past, the desirability of adding to our list of game birds from those of America is a subject that has been frequently mooted in England, but none of our numerous game preservers, as far as we are aware, seem to have been enterprising enough to undertake the task. While we talk, our transatlantic cousins act, and set us an example, in an experiment which, considering the number of our wealthy sportsmen and naturalists, one would have expected, would have been initiated with us. Among others such a grand game bird as the American ruffed grouse could, we feel satisfied, be established here, while the Virginian quail, a non-migratory bird, much resembling the members of the little colony of strangers recently transported to the fields of Vermont, but larger, would we have no doubt rapidly multiply on our stubbles, and as they lie well to dogs, it being characteristic of the species to do so, they would be a grand acquisition when partridge becomes too wild to remain in the same field where dogs are ranging.

ANOTHER HORSE STORY.—I have lately seen an old horse at Bourn, in Lincolnshire, on the history of which I can thoroughly rely, and it is so remarkable that I think it worth publication. I have seen the horse myself, and as far as personal observation goes, I can thoroughly endorse the story. The horse is aged twenty-two, of the old short-legged coaching stamp, and has been in the possession of the present owner upward of sixteen years, during which period he has only had three days' rest, not excluding even Sundays. His work has been to run a heavy mail-cart from Bourn to Swayfield, a distance of fourteen miles, including the return journey, every day, and one day a week two miles extra. The horse leaves Bourn between six and seven in the morning, and reaches Bourn about seven in the evening. During his recreation at Swayfield, the horse is kept in further exercise by working at plough and other work upon a farm. He is without blemish and in capital condition. His work for the last sixteen years has been so uniform that the horse knows the particular places he has to stop at on given days of the week; for instance, he persistently stops at the barber's shop on Tuesdays and Fridays, and six days a week he stops at a draper's shop for parcels, and on Sundays he won't stop at either place. His owner is so fond of him that, with a sort of feeling of Tom Moody, he hopes that he and his horse may be buried together.—*Correspondence London Field*.

—Two little edible dogs from China have been received at the Acclimatization Garden in Paris. These interesting canines have heads like pugs, are very small and fat and short legged, and are eaten usually when two months old, after being fed exclusively on rice and milk. They are eaten roasted, and served in cuts with soy.

EATON'S RUST PREVENTATIVE.—A correspondent suggests the preventative as a sovereign remedy for canine parasites.

\* Delivered before the American Association for the Advancement of Science, at Nashville, Tenn., Aug 31, 1877.

## Fish Culture.

### THE U. S. FISH COMMISSION IN SALEM.

ON BOARD THE U. S. STR. SPEEDWELL,  
MASS. BAY, Aug. 10, 1877.

EDITOR FOREST AND STREAM:

While we are on our way to a locality in which experience has led us to expect rich returns from the dredge the tangles, and the trawl, an opportunity is offered to furnish your readers some account of the doings of the Commission in these waters. First, allow me to introduce the party now in the field, the character of the work contemplated and the outfit to be employed.

#### THE PARTY.

Prof. S. F. Baird, of Washington, Commissioner, assisted by his private secretary, Mr. H. E. Rockwell, and by Mr. J. Paul Wilson and Mr. H. E. Gill; Prof. A. E. Verrill, of Yale College, assisted by Mr. E. B. Wilson, of Chicago; Mr. G. Brown Goode and Mr. Tarleton H. Bean, of the U. S. National Museum; Lieut. Commander A. G. Kellogg, U. S. N.; Dr. T. Hale Streets, U. S. N.; Mr. A. V. Zane, U. S. N.; Mr. J. S. Smith, of Baltimore; Mr. H. C. Chester, of Noank, Conn. The steamer has a force of twenty-four men, including the non-commissioned officers.

#### THE OUTFIT.

The government has detailed for Prof. Baird's use during the summer the Speedwell, a handsome iron steamer of 310 tons. This vessel is fitted up in the same manner as the Blue-light, with which your readers have become familiar; its greater size, however, furnishes increased facilities and accommodations for work. She is in charge of Lieut. Commander A. G. Kellogg, U. S. N., with Dr. T. Hale Streets, U. S. N., as surgeon, Mr. A. V. Zane, U. S. N., engineer, and Mr. J. S. Smith, first officer. Prof. Verrill and Mr. Wilson have charge of the invertebrate collections and deep-sea research. Mr. Goode and Mr. Bean give their time to the interests of the fishes and the fisheries. Capt. Chester lays us all under obligations by making himself indispensable wherever he is.

For the capture of sea animals we have dredges, tangles, dip-nets, trawls, seines, towing-nets, pile-scrappers, hooks, hilly irons, harpoons, spears, set-lines, trammel nets, gill nets, casting nets and other implements usually employed for such purpose. A new piece of apparatus, for which we are indebted to Sweden, and which is copied from the English "bull-dog" described in "Depths of the Sea," is introduced on our coast for the first time. This instrument operates on the principle of the "steel trap." Instead of narrow arms for seizing the prey, it has two scoop-shaped jaws of metal, brought together and firmly held by a powerful spring. The trap is set and then lowered, with the tread-plate pointing downward. As soon as the plate touches the bottom the jaws close with a snap and scoop up whatever may be within reach. It is useful in soft mud. The water-bottle, Miller-Casella thermometers and Green's thermometers continue in use. The accuracy of the Miller-Casella is tested by means of standard thermometers used in water brought up by the water-bottle.

For the preservation of living animals while they are under observation, the requisite stock of pails, crockery, glass ware and aquaria is furnished. Alcoholic collections are kept in jars, bottles, vials and copper tanks. In less than a week a barrel of alcohol has been used. Picric, osmic and chromic acids are employed in hardening tissues. Glycerine is resorted to for the protection of soft tissues.

#### WORK PROPOSED.

The important issues which called the U. S. Commission of Fish and Fisheries into existence are well understood, and the methods of investigation have been clearly set forth in FOREST AND STREAM and other leading publications, as well as in the commissioner's official reports; but, as the duties of the present season have some distinctive peculiarities, it will not be amiss to invite attention to them. One of the objects of the Commissioner is to be present at the joint fishery convention to be held in Halifax in the present month. For this purpose, the sea-going Speedwell was detailed and appropriately fitted. This will afford a fine opportunity for the study of the habits and migrations of many of our most important food fishes, and for making large additions to our collections.

Another feature of this season's work, which comes out prominently and bids fair to become one of the most important, is the determination of the boundaries of old fishing grounds and the discovery and location of new ones. The Commission has already met with remarkable success in the capture of a species of flat-fish or flounder, heretofore supposed to be peculiar to Arctic Europe, and little known even there. It is called, by ichthyologists, *Glyptocephalus cynoglossus* (Linn.), Gill. This species was captured in large numbers, and in many stages, from the young of the year to adults measuring two feet in length. It was taken by the trawl in fifty fathoms of water, just outside of frequented fishing grounds in Massachusetts Bay. This craig flounder or pole, although known to be a favorite food fish on the coast of Greenland, has not yet been put to the test of the table here because of its great rarity; but its relations to the flat-fish, the common flounder and the halibut warrant us in predicting that it will prove to be well flavored, especially as its tissues

are beautifully white and firm. Should this accession to our fauna meet the expectations of its discoverers, and there is every reason to believe that it will, the importance of the addition may readily be appreciated, and all the more, because the capture of the young establishes the presence of the adults as a permanent source of supply.

The investigation of the condition of our fisheries and the measures necessary to insure their continued usefulness involves a systematic and exhaustive study of the food supplies upon which the occurrence of fishes in given localities at certain times depends. The movements of fishes are not capricious and uncertain, but they are governed by fixed laws, by far the most important of which is the law of self-preservation. A fish recognizes the dignity and the importance of eating. He is as absolutely at the mercy of his stomach as some more highly organized vertebrates. He lives to eat, and is to be found where the ruling desire of his life may be gratified. The species that feed upon shrimp and crabs will appear and disappear with the presence or absence of these crustacea. The occurrence of proper food determines the fact and the time of the arrival of the fish. The shrimp and the crab must eat, too, and they do their share of it. These creatures, then, in their turn, are present or absent as their food is present or absent, and thus we might pursue the subject of eating to remote limits, and find higher forms of animal life depending for subsistence upon lower forms or upon one another, and the lower upon still less highly organized animals or upon vegetables, and vegetables upon the bounty of the soil and the water. We see, therefore, what a complex chain of dependencies is to be grappled for, link by link—a chain involving the character of the bottom, the depth, temperature and chemical constitution of the water, the direction and force of currents, and other physical conditions which affect life in the ocean. Parts of this chain have been discovered, and the Commission hopes to gain possession of many missing links during its labors, so that the phenomena of ocean life may be as well understood and as readily applied to practical uses as meteorological phenomena. In other words, the time is near when it will be entirely practicable to predict the finding of valuable food fishes from the occurrence of fish food in the waters examined, and this, too, long before the fisherman in his laborious empirical method of dropping a line to get a bite has struck the right spot. To illustrate: suppose you cut open the stomachs of a great many cod and almost uniformly find in them certain crabs and mollusks. Now, if you are on grounds not frequented by fishermen, and in dredging the bottom, take these crabs and mollusks on which cod feed, what would you infer? Cod. Well, you might go back to the food of the crab and the mollusk, and, this found, you would expect to find what it supports. In this way, from the occurrence of animal life very remotely connected with fish life, naturalists are enabled to locate and establish the boundaries of new fishing grounds far in advance of the capture of fishes, thus opening the way to new fields of industry, while they determine the limits of those already in operation.

#### RESULTS OF OPERATIONS IN SALEM.

The steamer has been out five times, beginning Aug. 4. Since that time we have made the following collections: Twenty species of bryozoans; twenty-five sponges, including the rare *Phakellia ventralis*; seventeen echinoderms, among them *Pteraster militaris* and *Opidacantha spinulosa*, both rare, and some fine specimens of that magnificent and very rare star-fish, *Hippasteria phrygiana*. Of the *Hippasteria* one individual was caught, in the tangles, which measured a foot in diameter; twenty species of hydroids, including *Corymorpha pendula* and *Acaulis primarius*; nine species of polyps, the finest being a very large sea-anemone, *Urticina digitata*; eleven ascidians, the first on my list being *Bolitaena reniformis*; one brachiopod, *Terebratulina septentrionalis*; twenty-two lamellibranchs, the rarities being *Foidia theraeformis*, *Foidia obesa* and *machava squama*; thirty-seven gastropods, including *Chiton Emersoni*, *C. mendicorum* and *Scaphander punctulatus*; forty-five annelids, of which I name *Protula media*, *Mysicola Steenstrupi*, *Tecturcula fideida*, *Euphrosyne borealis*, *Rhynchobolus albus*, and *Cryptonota citrina*, Stimp.; ten nemerteans; five sipunculoids, the rare *Chetoderma nitidulum* and the fresh spines of the extremely rare *Echiurus* being the prizes; thirty-two crustaceans, of which two, at least, are rare—*Pandalus borealis* and *Sabinea septemcarinata*. All the shrimps were simply huge!

The number of species of fishes collected up to the present time is twenty-three, seven of which are shore species and sixteen belong to the deep sea. The fishes taken in shallow water are:

Tom cod (*Fundulus pisculentus*); Stickle-back (*Gasterosteus bleaculeatus*); Alewife (*Pomolobus pseudoharengus*); Silver-side (*Chirostoma notatum*); Flatfish (*Pseudopleuronectes americanus*); Eel (*Anguilla rostrata*); Pipefish (*Syngnathus* sp.).

Tom cod is the Salem name for *Fundulus*. All of the above are common and abundant.

Lumpfish (*Ocyropterus lumpus*) was taken on floating rock-wood.

The species taken in from twenty to fifty fathoms of water in Massachusetts Bay are:

Eighteen-spined sculpin (*Cottus octodecimspinosus*); Sen-raven (*Hemirhamphus acaudinus*); Hake (*Phycis tenuis*); Norway Haddock (*Sebastes* sp.); Angler (*Lophius americanus*); Eelpout (*Zoarces anguillar*); Whiting (*Merluccius bilinearis*); Skate (*Raia radiata*); (*Rhinorema caudacuta*); Rusty Flatfish (*Myoxocephalus ferrugineus*); Flounder (*Pomato-*

*setta dentata*); Craig-flounder or Pole (*Glyptocephalus cynoglossus*); (*Aspidophoroides monopterygius*); (*Icelus uncinatus*); Spiny lumpfish (*Eumicotrema spinosus*).

Many of the last named fifteen species are peculiar to Arctic regions, and the same is true of the deep water invertebrates; indeed the occurrence of northern forms in abundance is a constant source of surprise. *Aspidophoroides monopterygius* has been taken very rarely in the stomachs of cod and haddock. We trawled more than a dozen specimens at one haul. *Myoxocephalus ferrugineus* is very rare in collections. We have secured several specimens. Of the rare *Pomatocephalus dentata* we have about one hundred. *Eumicotrema spinosus*, so far as I can learn, has been captured twice before—by Prof. Verrill, at Eastport, and by the U. S. Fish Commission at the same place. *Icelus uncinatus* is new to North America. Our catch is nine individuals. *Glyptocephalus cynoglossus* also new to North America, came up in abundance.

I cannot forbear alluding to a curiosity which excited the admiration of all on board the Speedwell. It was a mass of spawn of the angler (*Lophius americanus*) which must have measured fifty feet in length by two in width. Floating as it did on the surface, with its partially segmented eggs giving it the appearance of a pinkish-brown, gauzy veil, gathered into graceful folds, it was certainly "a thing of beauty" and "a joy forever" to the contemplative fisherman, though little calculated to inspire the pound-men who see trouble in futuro.

Another diversion was the "blowing" of a school of huge fin-back whales (*Megaptera* sp.), which alternated between "soundings" and surface evolutions very near the steamer. The fin-back, like the blackfish (*Globicephalus*) and the majority of the whales blows columns of spray straight upward. In this case the spray seemed to reach a height of ten or twelve feet.

On Monday an early start is projected for the grounds where many rarities were secured. We expect then to hear the familiar sound of Capt. Chester's voice in the welcome and inspiring cry of "Up dredge!" and "Up trawl!" perhaps for the last time in Salem waters; but we shall carry away with us rich collections and pleasing remembrances. A day on board the Speedwell would give you a more vivid idea of the wonders and the beauties of deep sea work than my inefficient English can convey. I can, therefore, only wish that all who appreciate the treasures of the sea might exchange the imperfect picture for the faultless original. T. H. B.

#### SPLIT BAMBOO RODS.

To Our Customers and the Public:—In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

—[Ado.] CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

## Natural History.

### THE GAME FISH OF WISCONSIN.

The following is a brief description of the game fishes of Wisconsin, being those most sought after, and giving the most sports with rod and reel:

#### FAMILY PERCIDÆ.

*Perca flavescens*, Cuvier.

#### YELLOW PERCH.

This well-known fish, the especial pet of idly anglers, is very common throughout the State. In some of the lakes it reaches two pounds in weight, and affords considerable sport with light tackle.

*Stizostedion Americana*, Cuv. and Val.

#### PIKE PERCH—WALL-EYED PIKE. DOY.

Very common in most of the lakes and rivers of the State. It is a bold biter and hard pulling fish, and a fine fish for the table; usual weight, from three to ten pounds.

#### FAMILY LABRACIDÆ.

*Riococcus Chrysops*, Gill.

#### WHITE LAKE BASS.

Found in Lakes Michigan and Winnebago, the lower Fox River, and a few other waters in the State. He is a good pan fish and bites greedily; will weigh two pounds or more.

#### FAMILY ICHTHYURIDÆ.

*Micropterus Salmoides*, Gill.

#### SMALL-MOUTHEED BLACK BASS.

This, the true black bass, is one of our gamest fishes, if not the gamest. I consider him—pound for pound—as hard fighting and brave a fish as swins; and with light and suitable tackle and fair play, he will furnish more sport for his inches and more pluck for his ounces than any other fish with which I am acquainted. He is very generally distributed throughout the lakes and rivers of Wisconsin, and in nearly all instances inhabiting the same waters with the *M. nigricans*, or large-mouthed black bass mentioned below. Weight from one to five pounds.

#### Micropterus Nigricans, Cuvier.

#### LARGE MOUTHEED BLACK BASS—OSWEGO BASS.

This variety of black bass is second only in many qualities to the variety named above. It grows somewhat larger and heavier, but is not nearly so trimly built as the former. He has a much larger mouth, larger scales, is thicker through the shoulders, and has a greater depth of body, and shows more white upon the belly than his more thoroughly bred congener (*M. salmoides*). The small-mouthed bass has invariably more or less red in the eye, which color is as certainly absent in the eye of the large-mouthed bass. Both varieties vary greatly in color. Adjacent lakes and neighboring waters will produce fish exhibiting all the various shades of green, from black or bottle green to greenish yellow; but, as a rule, green is the dominant shade of the large-mouthed bass, while the small-mouthed variety is more sombre in hue. Weight from one to seven pounds.

*Anaploplites Rostratus*, GILL.  
ROCK BASS—RED EYE.

The waters of the State fairly swarm with this greedy and free-biting fish. He will take anything in the form of a bait, and on this account is quite a favorite with many. He is not lacking in gamey features, and will often weigh as much as two pounds.

*Hyporhamphus heteroclitus*, GILL.

SPOTTED BASS, SILVER BASS, BAR FISH, CROPPIE.

This pretty and polyphagous fish is extremely common throughout the State, being found in the same waters with the rock bass and yellow perch. He is a bold and voracious fish, and furnishes good sport to the still fisher, often exceeding two pounds in weight.

*Pomoxis Annilis*, Gunther.

COMMON SUN-FISH, PUMPKIN SEED.

*Ichthyia Nitida* (F.), GILL.

LONG-EARED SUNFISH.

These two varieties of sunfish are very plentiful in all waters of the State, and are the special objects of pursuits of juvenile anglers.

FAMILY ESOCIDÆ.

*Esox Nilotior*, Thompson.

MUSKELLUNGE, MASCOLOUNE.

This noble fish, the giant of fresh water game fishes, inhabits the lakes in the extreme northern portion of the State and Lake Superior. He is found in all his glory in the lakes now accessible by the Wisconsin Central Railroad, where he is taken frequently weighing forty pounds. The capture of one of these monsters is regarded as the height of piscatorial ambition.

*Esox Lucius*, Linnaeus.

PICK—NORTHERN PICKEREL.

This tyrant of the waters abounds in most of the lakes and rivers of Wisconsin, growing to the weight of twenty pounds. He is extremely fierce and voracious, will bite at anything in the shape of bait, from an angle worm to a spring chicken. He is not considered gamey in this section, being more of a bully than a fighter, a poacher rather than a sportsman, a dunghill rather than a thoroughbred. He is full of bones, and a poor table fish.

FAMILY SALMONIDÆ.

*Salmo Namaycush*, Pennant.

MACINAW TROUT, SALMON TROUT, LAKE TROUT.

This is principally a commercial fish, and is taken in Lake Superior, in the neighborhood of Ashland and Bayfield, also in Lake Michigan, at Green Bay and other points. It is a good table fish, a ravenous feeder and can be taken by trolling with the spoon, or a hook baited with herring. In the winter they are caught in large numbers through the ice, biting greedily at a piece of pork for bait. He is a hard fighting and strong pulling fish.

*Salmo Siscowet*, Agassiz.

SISCOWET, SISKAWITZ.

This is also a commercial fish, and much superior to the Mackinaw trout in flavor, though he does not grow nearly so large. He inhabits Lake Superior only, and is taken in nets in the vicinity of the Apostle Islands. He is frequently taken by trolling with artificial and natural bait.

*Salmo Fontinalis*, Mitchell.

SPECKLED BROOK TROUT.

This favorite and peerless fish is taken in the streams in the western part of the State, which empty into the Mississippi River above Prairie du Chien, and in those emptying into Lake Superior and Green Bay. The largest trout and best fishing is in the immediate vicinity of Ashland and Bayfield on Lake Superior.

*Coregonus Albicorpus*, La Sneur.

WHITE FISH.

The whitefish is famous as being the very best table fish that inhabits fresh waters. It is strictly a commercial fish, and is taken exclusively in nets in Lake Superior and Michigan, though I have heard of their being taken with the artificial fly at certain seasons in Lake Mendota, near Madison, into which lake they were introduced by Gov. Farwell in 1854.

*Argyrosomus Clupeiformis*, Agassiz.

LAKE HERRING.

This fish, which by the way is not a herring but a sisco, inhabits the shoal waters of Lakes Michigan and Superior. It is also a commercial fish, but is caught in considerable numbers about the docks and piers with hook and line in the spring and fall; they may also be taken with the fly.

*Argyrosomus Sisco*, Jordan.

SISCO.

This is the sisco, the most noted member of the family, and is found in Lake Geneva, near Geneva, and in Lakes Oconomowoc, Nashotah, Nemahlin, La Belle, and perhaps others near Oconomowoc. During the month of June they are taken in large numbers under the "sisco fly"—a grayish fly that covers the lakes at that time. They are also taken in winter through the ice at a depth of fifty feet or more. They may also be taken with a small white or gray artificial fly in June.

*Argyrosomus Hoyi*, Gill.

MOON-EYE.

*Argyrosomus Nigripinnis*, Gill.

BLACK FIN.

These two varieties of sisco are found in Lake Michigan. The blackfin is occasionally taken with the fly.

In the above classification I have purposely omitted the catfish, bull-head, sturgeon, sucker, dogfish, etc., as they do not properly come under the head of game fishes. In the arrangement of the families, genera and species, I have endeavored to follow the nomenclature of Prof. Theo. Gill and D. S. Jordan, while the vernacular is that common to the State.

OCONOMOWOC.

## SOMETHING ABOUT INSECTS.

TO the naturalist—or to any person who has a taste for the pursuits of a naturalist, there is, perhaps, no subject which presents such fascinating features, nor such inexhaustible resources for entertainment and close study as entomology. The meaneast insect possesses claims to consideration which only require to be understood to be universally acknowledged. The metamorphosis of the grub into the chrysalis, in the strict sense of the term, or the quiescent chrysalis into the active, beautiful, brilliant butterfly, while it no longer possesses a claim to the supernatural, has by no means lost its legitimate character of the wonderful.

Many persons have, at some time or other, kept silk worms, and are consequently pretty well acquainted with the changes they undergo in their progress from the egg to the perfect

winged condition. To those who have not had this opportunity of practically giving a knowledge of the economy of the butterfly tribe, the following passages extracted from the writings of Kirby and Spence on this interesting subject will in a great measure supply this information. "That butterfly which amuses you with its aerial excursions; now extracting nectar from the tube of the honeysuckle, then, the very image of fickleness, flying to a rose as if to contrast the hue of its wings with that of the flower on which it reposes, did not come into the world as you now behold it. At its first exclusion from the egg, and for some months of its existence afterward, it was a worm-like caterpillar crawling upon sixteen short legs, greedily devouring leaves with two jaws, and seeing by means of twelve eyes, so minute as to be nearly imperceptible without the aid of a microscope. You now view it furnished with wings capable of rapid and extensive flights; of its sixteen feet ten have disappeared, and the remaining six are in most respects wholly unlike those which they have succeeded. Its jaws have vanished, and are replaced by a curled-up proboscis suited only for sipping liquid sweets. The form of its head is entirely changed, two long horns project from its upper surface, and instead of twelve invisible eyes you behold two, very large and comprised of at least 20,000 convex lenses, each supposed to be a distinct and effective eye. Were you to push your examination further, and by dissection to compare the internal conformation of the caterpillar with that of the butterfly, you would witness changes even more extraordinary. In the former you would find some thousands of muscles, which in the latter are replaced by others of a form and structure entirely different. Nearly the whole body of the caterpillar is occupied by a capacious stomach. In the butterfly this has become converted into an almost imperceptible thread-like viscus; and the abdomen is now filled by two large packets of eggs or other organs not visible in the first state. In the former two spirally convoluted tubes were fitted with a silky gum; in the latter both tubes and silk have almost totally vanished; and changes equally great have taken place in the economy and structure of the nerves and other organs.

What a surprising transformation! Nor was this all. The change from one form to the other was not direct. An intermediate state not less singular intervened. After casting its skin, even to its very jaws, several times, and attaining its full growth, the caterpillar attaches itself to a leaf by a silken girth. Its body greatly contracted, its skin once more split asunder and disclosed an oviform mass without exterior mouth, eyes or limbs, and exhibiting no other symptoms of life than a slight motion when touched. In this state of death-like stupor, and without tasting food, the insect existed for several months, until at length the tomb burst, and out of a case not more than an inch long and a quarter of an inch in diameter, proceeded the butterfly before you, which covers a surface nearly four inches square."

Witnessing, as they doubtless did, these extraordinary changes, without being able to account for them physiologically, it is quite possible, as Kirby has suggested, that "some of the wonderful tales of the ancients were grafted on the changes which they observed to take place in insects." The story of the phoenix, for example, in many of its particulars, closely resembles various occurrences in the metamorphosis of insects.

At first a worm, emerging from the ashes of its parents' funeral pile, and eventually a glorious winged creature, providing, in the means of its own destruction, the nidus of its future and unseen progeny, the fabled phoenix might assuredly have acquired its type from the actual butterfly without any great stretch of the imagination. Then again, the doctrine of metempsychosis, or transmigration of souls, would, to the minds of the early observers, be shadowed forth in the apparent re-vivification of the seemingly dead chrysalis. But the doctrine of a future life, more glorious than that of transmigration, also derived support and countenance from the remarkable vicissitudes of insect life. In the words of Newman—

"What can be more wonderful than the fact that an unsightly worm should pass through a shrouded and death-like sleep, and should wake, at last, a glorious butterfly, to bask in sunshine, float on the impalpable atmosphere and quaff the luscious nectar of beautiful flowers! Well might such a miracle be made a poet's theme! Well might those philosophers, on whose mind there dawned, albeit dimly, the great truth of an after life—well might they imagine their toilsome existence, typified in the caterpillar, their descent to the grave in the tomb-like repose of the chrysalis, and the hereafter they sighed for in the spirit-like resurrection of the happy butterfly; and, seizing with avidity the idea, well might they designate these aerial creatures by the name of souls."

Observation and research have shown the true nature of insect metamorphosis; it is now established beyond a doubt that the wings and legs and other part of the butterfly pre-exist in the chrysalis, and even in the caterpillar. These facts have been ascertained by immersing the chrysalis and caterpillar in hot water, and dissecting them when a greater degree of solidity has thus been given to the various parts. This is still more minutely explained by Kirby and Spence in the following paragraphs:

"A caterpillar is not, in fact, a simple, but a compound animal, containing within it the germ of the future butterfly included in what will be the case of the pupa, which is itself included in three or more skins, one over the other, that will successively cover the larva. As this increases in size, these parts expand, present themselves, and are in time thrown off, until at length the perfect insect which has been concealed in this succession of masks is displayed in its genuine form.

"That this is the proper explanation of the phenomenon,

has been satisfactorily proved by Swammerdam, Malpighi, and other anatomists. The first mentioned illustrious naturalist discerned by accurate dissections not only the skins of the larva and of the pupa incased in each other, but within them they very butterfly itself, with its organs, indeed, in an almost fluid state, but still perfect in all its parts.

"Of this fact you may convince yourself without Swammerdam's skill, by plunging into vinegar or spirits of wine a caterpillar about to assume the pupa state, and letting it remain there a few days for the purpose of giving consistency to its parts; or by boiling it in water a few minutes. A very rough dissection will then enable you to detect the future butterfly; and you will find that the wings, rolled up in a sort of cord, are lodged between the first and second segment of the caterpillar, and that the legs, however different their form, are actually sheathed in its legs. Malpighi discovered the eggs of the future moth in the chrysalis of the silk worm only a few days old, and Reaumur those of another moth (*Agropygma dispar*) even in the caterpillar, and that seven or eight days before its change into the pupa. A caterpillar then may be regarded as a locomotive egg, having for its embryo the included butterfly, which, after a certain period, assimilates to itself the animal substances by which it is surrounded; has its organs gradually developed, and at length breaks through the shell which incloses it."

That author also adds: "This explanation strips the subject of everything miraculous, yet by no means reduces it to a simple or uninteresting operation. Our reason is confounded at the reflection that a larva, at first not thicker than a thread, includes its own triple, or sometimes octuple teguments; the case of a chrysalis, and a butterfly, all curiously folded into each other; with an apparatus of vessels for breathing and digesting, of nerves for sensation, and of muscles for moving; and that these various forms of existence will undergo their successive evolutions by aid of a few leaves received into its stomach. And still less able are we to comprehend how this organ should at one time be capable of digesting leaves, at another only honey; how one while a silky fluid should be secreted, at another none; or how organs at one period essential to the existence of the insect, should at another be cast off, and the whole system that supported them vanish."

KEUKA.

IF MORE ABOUT SHARKS.—The interesting article in your paper of Aug. 10, upon sharks, repeats the common statement that the sharks are obliged to turn upon their backs to seize their prey. Did he or any other person ever see them do this, or is it the mere repetition of a common error? I have seen in my time thousands of these fishes, and have caught many of them with hook and line, but have never, that I can remember, seen them perform this revolution. Moreover, on putting the question to an old fisherman on the Florida coast, who made a business of catching sharks for their oil, his reply was that they seized their prey like any other fish.

I have no doubt that the sharks are viviparous, having frequently seen the young ones taken from the dead parent, ten or twelve inches in length, when on being released, they swam away, apparently well able to take care of themselves. Usually, I think, about ten or fifteen in number.

As to the voracity of the sharks, and their desire for human flesh, I think the different species vary, and perhaps the same species may vary in their habits in different localities. On the coast of Florida where the sharks are very large and numerous, I have not heard of a well authenticated instance of a man destroyed or attacked by them, while there are many such recorded in the West Indian Seas. Even the most ferocious and destructive animals seem to have a dread of mankind, whom they only attack under exceptional circumstances, and then finding them an easy prey they continue their depredations. This is the case with the lion and the tiger, and may be also with the shark.

S. C. C.

[We have frequently seen sharks turn slightly upon the side to seize their food, but the idea that they turn upon their backs is simply nonsense.—Ed.]

WHAT BECOMES OF THE DEAD ELEPHANTS?—An experienced elephant-hunter writes as follows: "I should like some naturalist to explain to me why it is that a hunter is never able to find a dead elephant. Of course after you bring him down he is there before you; but show me a man who has ever found the skeleton of an elephant in those vast Cingalese forests, or has come upon the carcass of one that has died a natural death? For ten years I have hunted unremittingly, tramping over hundreds of miles, in all sorts of solitudes, and never succeeded in discovering such a curiosity.

Mr. Emerson Tennent tells us of a gentleman who lived for thirty-six years in the jungle, exploring valleys and tracing roads, during his trigonometrical pursuits, who never once came upon the skeleton or decaying body of an elephant that had died a natural death.

The Cingalese believe that there is some mysterious valley into which these animals hasten when they feel the approach of death, and thus the island contains a vast mausoleum, wherein are entombed all the giants of the forest that have gone on before.

There might be some reason to believe this fanciful theory if this cemetery was ever discovered, but its precise location is still unknown, and the conundrum as to what becomes of all the dead elephants is interesting and seemingly insoluble.

This would lead one to believe that there was some peculiarity in the Cingalese climate that dissolved or decomposed the bones. Such might be the fact were it not for the grinders and tusks. There is no climate on the face of the earth that can destroy them, and so you see, we are brought back to the same point from which we started.

[The same question may with propriety be asked regarding many other species of Nature's kingdom. The probabilities are, however, that the remains of animals are speedily made away with by insects and rodents. How often we find fallen antlers almost unrecognizable, owing to the ravages of rodents; and in a tropical forest certain ants would remove even the unwieldy carcass of an elephant in less than twelve hours.—Ed.]

THE RUFFED GROUSE—A QUERY.—Some years ago I was walking with a friend in a pasture adjoining a woodland. The earth was soft from recent rains and we had no difficulty in approaching within ten yards of a female grouse with her young. Our astonishment was great when she flew off with her young brood hanging to her feathers with their bills; the little ones were arranged symmetrically on each side of the mother under her wings. The pas-

\* The Greek word signifies both *owl* and *butterfly*.

season I have been fortunate enough to see the same thing and at nearly the same place. In all works to which I have access I have been unable to find any reference to the habit in question; and as many old sportsmen to whom I have narrated the above doubt the reliability of my observations, I would like any one who has observed the above habit to give their testimony to its truth through the columns of the FOREST AND STREAM. J. T. B. S.

[This is not new, though but few works have noticed it.—Ed.]

**ANOTHER HUMBUG HYBRID.**—A few days since a correspondent sent us a cat which in early kittenhood had evidently met with an accident which removed the tail and injured both legs, also dislocating one hip. The youth of the animal prevented scars being seen, and as pussy's walk and mode of standing upon her hind legs was not dissimilar to that of a rabbit, the conclusion was reached that it was a hybrid of a cat and hare, and the cat sent to us for examination. As before stated in these columns, such a hybrid is a physiological impossibility.

**INSTINCT VS. REASON.**—My small Scotch terrier, two years old, of not very pure blood, was one afternoon in a chamber, in front of an old-fashioned pier glass, fastened on the dividing wall between this room and the next. As soon as he caught sight of his image, he ran up to the glass and nosed about in an excited way, then ran round by a door into the other room and made a thorough examination of all the parts and the furniture, barking and wagging his short stump of a tail. Failing in his search, he returned to the glass again, saw his image, and was satisfied at once that no dog but himself was there. He never could be excited by so placing him again, and evidently had either solved the problem or had at least determined that there was some fraud about it. No human being could do more, and this is simply one of many instances well known where extreme power in instinct equals our boasted superiority of reason, it seems to me.

SAWYER.

**MELANOSIS.**—I have in cage a black robin (*Turdus migratorius*, Linn.) as black as a grackle. It was taken from the West about two months ago, is now moulting, and I am anxious to see what the moult will be like. This black plumage for small birds must be very rare, as I have over twenty species of albinos in my collection, and but two melanos. This black or dark plumage is not uncommon with some of the larger hawks. GEO. A. BOARDMAN.

Miltoen, St. Stephens, Aug. 26, 1877.

—I obtained last weeks a chipping squirrel jet black, I have had an albino of that variety, but have never seen or heard of a case of this kind. Is it a common occurrence?

A. J. COLBURN.

31 Boylston street, Boston, Mass., Aug. 30.

[Lovers of the curious can view it at above address. Melanosis is by no means uncommon particularly among birds, but it is not of sufficient frequency to cause the interest of the naturalist to wane, as it has in the case of albinos.—Ed.]

**ALBINO ROBIN.**—While out for a stroll Aug. 25, I discovered a white bird perched upon the limb of an old elm. Upon examination it proved to be a beautiful specimen of the robin (*Turdus migratorius*). It was a perfect albino without a spot. I have seen but one before, which was the property of George Dwight, of Sheffield. FRANK H. MERTON.

Hatfield, Mass.

**TO PREPARE FISH SKINS.**—Skin your fish carefully, but do not be particular as to leaving a little meat on. Spread the skin in layers and sprinkle with salt and alum, or make a pickle in a small keg of a weak solution of carbolic acid. Any remaining flesh can be scraped off afterward and the fish set up by a taxidermist. Many of the most delicate fishes with large scales will not stand the above treatment, to say nothing of mounting them afterward.—From *Hallock's Sportsman's Gazetteer*.

—Three Arabian sheep, the first of the kind ever brought to this country, are on their way to Philadelphia.

**INTELLIGENT OYSTERS.**—These educated oysters interest us. It is agreeable to know that oysters possess powers of perception, thought and affection; that they can recognize their friends among men; that they can show gratitude for kindness, and that they can give tangible evidence of being filled by the passion of revenge. If the education of those that have already been put in training can be properly completed, we may have revelations of a still more surprising nature. They are cunning, a quality into which many faculties enter. When they catch sight of their friend Hamilton they open their shells in a seductive manner, and when he gives them some dainty morsel, they close up to revel in its enjoyment. One of them has a way of inviting him to put his finger inside of its shell. It can recognize him, as the rest of them can, at a glance, and will not allow other people to take the liberties freely enjoyed by him. A stranger tried to deceive it, but it made him squirm as it closed on his finger, which it refused to release till the touch of its friend soothed its wrath. It is said in the books that the adult oyster has no power of locomotion, but these educated oysters, under the control of their affections, are practicing the art of propulsion. Confidence is a plant of slow growth in oysters as in men, and it required weeks to bring the educated oysters up to the point of trusting in anybody. They had probably been in the habit of looking on man as a monster, destitute of the better qualities that dwell in the mind and shell of an oyster. One reason for the superiority of the oyster is probably to be found in the fact that it does not look out of one eye, like Polyphemus, or out of two eyes like ordinary human beings, but out of those numerous yellowish brown eyes that lie between the fringes of its mantle. Let us think of these things, when consuming oysters raw, on the half shell, regardless of their views and feelings.—*Ex.*

## ETHNOLOGICAL.

WASHINGTON, D. C., June 15, 1877.

EDITOR FOREST AND STREAM:

Sir: Being engaged in preparing a memoir upon the "Burial Customs of the Indians of North America, both Ancient and Modern, and the Disposal of their Dead," I beg leave to request your kind co-operation to enable me to present as exhaustive an exposition of the subject as possible, and to this end earnestly invite your attention to the following points in regard to which information is desired:

1st—Name of the tribe. 2d—Locality. 3d—Manner of burial, ancient and modern. 4th—Funeral ceremonies. 5th—Mourning observances, if any.

With reference to the first of these inquiries, "Name of the Tribe," the Indian name is desired as well as the name by which the tribe is known to the whites. As to "Locality," the response should give the range of the tribe, and be full and geographically accurate. As to the "Manner of Burial," it is important to have every particular bearing on this branch of the subject, and much minuteness is desirable; for instance:

(a) Was the body buried in the ground; if so, in what position, and how was the grave prepared and finished? (b) If cremated, describe the process, and what disposal was made of the ashes. (c) Were any utensils, implements, ornaments, etc., etc., or food, placed in the grave? In short, every fact is sought that may possibly add to a general knowledge of the subject.

Answers to the fourth and fifth queries should give as full and succinct a description as possible of funeral and other mortuary ceremonies at the time of death and subsequently, the period of mourning, manner of its observance, &c.

In obtaining materials for the purpose in question it is particularly desirable that well-authenticated sources of information only to be drawn upon, and, therefore, any points gathered from current rumor or mere hearsay, and upon which there is doubt, should be submitted to searching scrutiny before being embraced in answers to the several interrogatories, and nothing should be recorded as a fact until fully established as such.

In seeking information from Indians it is well to remember the great tendency to exaggeration they show, and since absolute facts will alone serve our purpose, great caution is suggested in this particular.

It is earnestly desired to make the work in question as complete as possible, and therefore it is especially hoped that your response will cover the ground as pointed out by the several questions as thoroughly as you may be able and willing to make it.

In addition to notes, a reference to published papers either by yourself or others is desirable, as well as the names of those persons who may be able to furnish the needed information.

Permit me to assure you that, while it is not offered in the way of inducement to secure the service asked, since it is barely possible you can be otherwise than deeply interested in the extension of the bonds of knowledge, full credit will be given you in the work for whatever information you may be pleased to furnish.

This material will be published under the auspices of Professor J. W. Powell, in charge of the U. S. Geographical and Geological Survey of the Rocky Mountain Region.

Communications may be addressed to me either at the address given above or at the Army Medical Museum, Washington, D. C.—Respectfully yours, H. C. YAKROW.

**WHITE WHALE FOR EUROPE.**—The first white whales brought to New York for exhibition were those captured by Mr. Barnum for his museum. This veteran showman now proposes to send one of these curiosities to be gazed at by our London cousins across the water. One of the specimens now in the Coney Island Aquarium is to be shipped via the steamship which sails for Southampton, Eng., the 15th of this month. A special tank is being prepared for his whaleship, and twenty bushels of cels will be provided for his support.

**ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING SEPT. 1, 1877.**—Two pine snakes (*Pituophis melanoleucus*) purchased; two alligators (*Alligator mississippiensis*) purchased; two Florida tortoises (*Testudo polyphemus*) purchased; one raccoon (*Procyon lotor*) presented by Mr. W. H. Whitman, N. Y. City; one gray squirrel (*Sciurus carolinensis*) presented by Master Geo. Tamlyn, N. Y. City; three gray foxes (*Vulpes virginianus*) presented by Mr. W. Wiggins, Mt. Hope, N. J.; one raccoon (*Procyon lotor*) presented by Mr. H. W. Tompkins, N. Y. City; one agouti (*Dasyprocta aguti*) presented by Capt. Samuel L. Clapp, P. M. S. S., Acapulco. This animal belongs to he same family as the Guinea pig, but more nearly resembles the hare in its movements and shape. The feet have long, strong claws; hind legs longer than the fore-legs; it measures about one foot six inches in length, and stands about twelve inches high at the croup; the hair on the upper part are annulated alternately with black, brown and yellow, giving an appearance of being speckled; the hairs on the croup are golden yellow and stand erect when the animal is startled; the hair on the body is about an inch long, while that on the rump is nearly three times this length, hence the generic name *Dasyprocta*; back part hairy. When the Antilles and Bahamas were discovered these animals were found in great abundance, and were said to be the largest quadrupeds there. They also abound largely in Central and South America, in which place they are used as a common article of food, the flesh being white, tender and well flavored, having somewhat the taste of a rabbit. They are gregarious, do not burrow, but shelter themselves behind rocks or the roots of trees. They have voracious appetites, eating all kinds of vegetables, particularly potatoes and yams. When eating they sit on the hind legs, carrying the food to the mouth with the fore-paws like the squirrel. They are destructive to the sugar plantations, committing great havoc by gnawing the roots of the canes, consequently are a source of considerable annoyance to the planters, who take every means to destroy them. The Agouti can be very easily domesticated.

W. A. CONKLIN, Director.

—One of the most delightful of all physical experiences is that of the bather when he steps out of the bath in a splendid glow of strength and health. He can increase this delight by recourse to B. T. Babbitt's Toilet Soap, a new article, which cannot be equalled, for it is composed of the finest vegetable oils, and prepared with the greatest possible regard to excellence of manufacture. Mothers need no longer fear that their little ones will absorb disease and poison from one of the most essential of physical operations.—[Ad.]

## A NEW RECOIL PAD.

Examine the new pad (just out) at C. L. Ritzmann's, 943 Broadway, can be put on and off the gun in a moment, needs no alteration to gun. Price only \$2. Best thing out.—[Ad.]

## Woodland, Farm and Garden.

### CHINA ASTERS.

THE sight of some beautifully grown Asters in a friend's garden, the other day, led us to think how seldom we see any worthy of the name, and how scurvily treated this magnificent flat flower is with us. There are two main divisions in Asters—the German and the French. The definition German is applied to those having tubular or quilled florets, though this is somewhat restrictive in its application, as the German growers have of late years done much in the way of improving the flat-petalled varieties also. The French Asters, which have large flat petals, are so named because the French florists took them in hand years ago, and effected in them a great and marked improvement. Taking the quilled type, it must be acknowledged that notwithstanding the Germans have grouped them into many assumed types (vide any German seed catalogue), yet but few of them are worthy of cultivation. What are termed Hedgehog, Porcupine, and other quilled forms, are generally of a poor or worthless character. A really good strain furnishes very beautiful flowers; the form is a half-ball of quilled petals, and many charming hues of color are found among them. Of the imported varieties, the best types are the German quilled and Reid's quilled; and in all gardens where cut flowers are in demand, a good sized bed of them should be grown to cut from. They require to be planted in rich ground, well manured, mulched with rotted manure in summer, and watered liberally in dry weather. Such a bed will yield large quantities of blooms for many weeks.

Passing to the French, or flat-petalled, section, it may be stated at the outset that its varieties are legion, but that the greater portion of them are next to worthless. One of the best forms is Truffant's peony-flowered perfection, which bears noble incurved vari-colored flowers. This is the French Aster, *par excellence*, and though it is now offered in a bewildering multitude of varieties, the type named will give the most satisfaction. Its flowers are large and full, with the petals folding inward—incurved, as it is termed. The next best is probably the Victoria Aster. This is of shorter and more rigid growth than the foregoing, and has very large, full-petalled flowers, but the petals lie outward, or are reflexed. This is a splendid variety, with full flowers like a half ball, and they assume a fine variety of colors. If any evidence were wanted of the popularity of this type, it may be found in the fact that it is fast taking the place of Truffant's for exhibition purposes. There is one good quality common to both these varieties, and that is, that under ordinary cultivation they will produce good flowers. They deserve, however, to be well treated, and will reward the painstaking amateur—if planted in rich ground, and given a little manure-water at the blooming season—with an abundance of rich double flowers. The dwarf Chrysanthemum-flowered Aster is a peculiar variety, flowering later, and producing large blooms, like those of a reflexed Chrysanthemum. Having a very dwarf, free-flowering habit, it is well adapted for flowering in pots, or for use as an edging to a bed of taller growing sorts. The Crown flower or Cocardean Aster represents a distinct and charming type, and is so named because of the flowers having a central disc of white, with a margin of blue, lilac, crimson, carmine and other shades. This is a selection from the Peony-flowered Aster; the florets are reflexed, but the flowers are not so large and full as those of the Victoria. There are yet two varieties that can be highly recommended, especially for pot culture and for small gardens. These are the Dwarf Pyramidal and Boltze's Dwarf Bouquet Asters. There is not a wonderful difference between them, but still enough to make their culture desirable. Very dwarf in growth and very free-flowering, they produce a variety of nice flat-petalled, various colored blossoms, that are unequalled to cut from; they are also well adapted for indoor or window decoration, before those grown in the open ground come into bloom. Aster seeds are somewhat difficult of germination, but there is little difficulty provided they be fresh and good. Seed a year old is difficult to germinate, and of little use to the amateur. They may be sown in pans, pots or shallow boxes, in a rich, light soil, and placed on a warm shelf in the greenhouse, a gentle heat in a dung frame, or a warm window in a dwelling. As soon as they are large enough to handle, transplant them to other pots or boxes, and encourage them to grow fast and vigorously. After being transferred to their permanent beds or borders, where they should have well enriched soil, a liberal mulching with plenty of water, and say a weekly allowance of manure-water after they get thoroughly established, will give quantity and quality of flowers enough to repay even the most fastidious and unreasonable cultivator.

—The cultivation of flax in the West is increasing, as it should. The Northwestern Flax Society report the average value of the crop per acre to be \$27.08. The United States import annually \$50,000,000 worth of flax, hemp and jute. Improved processes are steadily diminishing the cost of harvesting, preparing and manufacturing. Jute may be grown in the Southern States, hemp in Kentucky, Missouri, Illinois and Indiana; further North flax is at home. The two latter are extensively grown already.

**AMERICAN POMOLOGICAL SOCIETY.**—The annual meeting of this society opens at Baltimore September 12th, and continues for three days. The displays of fruit, especially from Virginia and South Carolina, promise to be unusually fine.

## WHY THE BAROMETER RISES AND FALLS.

FIRST of all, what is a barometer? It is a tube or pipe, closed at one end and open at the other, and made of some transparent material, such as glass, so that it may be seen through. This tube is filled with the fluid metal called mercury, and when quite full, the thumb is placed over the open end (so as to keep the mercury from falling out) and the tube is turned upside down. So the closed end is at the top; the open end at the bottom, and if the thumb were removed the mercury would, of course, run out. But now suppose you wished not to waste any, and so put the open end into a basin, with some more mercury in it, and then remove your thumb—what would happen? "Why the mercury would all run out into the basin," some one will say. But this is a mistake, as the Italian philosopher, T. Torricelli, found out; and whatever size or length of tube be taken, the whole of the mercury will not run out, but a length of about thirty inches of the tube will remain full of mercury, and you cannot make it run out into the basin unless you either pull the open end of the tube out of the mercury, or make a hole in the closed end of the tube. This puzzled Torricelli for a long time, until at last the thought struck him that the only thing which was on the mercury in the basin was the air, and that it was probably the weight of the air pressing on the metal which prevented its running out into the basin. "If so," thought Torricelli, "then if I take my tube and basin of mercury up a mountain, less and less of the tube will remain full, for there is evidently less air above the basin at the top of the mountain than at the bottom." You may be sure he did not wait long to test the experiment, and, to his great delight, he found the mercury getting lower and lower in the tube, thus proving that it really was the weight of the air that kept it in the tube at all. And so the instrument was called a barometer, which is derived from the Greek, and means a weight measurer. But if the barometer is watched it will be found to contain different quantities of mercury on different days. On a fine day the mercury will, as a rule, stand higher in the tube than on a wet day, or just before rain; and now for the reason of this. Why does the barometer rise (or rather the mercury in it) in fine weather, and fall when it is going to be wet? Now, dry air is much heavier than wet air, or air containing steam. The consequence is that when the air gets moist it becomes lighter, and presses less on the mercury in the barometer, so more mercury flows out into the basin, and consequently less remains in the tube, or, as we express it, the barometer falls. Now, when the air is very wet, there is, of course, more chance of rain than when it is dry; for rain is formed by the cooling of the steam contained in moist air.—"Little Folks" for July.

## THE ARCTIC WOODLAND.

POPULAR impressions are often far from the truth, and in regard to the Arctic regions they are undoubtedly so. A treeless land would be, in the opinion of most people, the idea which would suggest itself in regard to the regions in question. Yet this, though true, is not all the truth. Within the arctic circle are found trees, often forming considerable, though stunted, forests. In Eastern Siberia pines and other trees come down almost to the water's edge, while over all Western Siberia, Arctic Russia and Lapland the tree limits run within the Arctic circle; trees extend even to the North Cape. In Greenland we find, even in the most southerly parts of it, no herbage more worthy of the name of tree than the stunted birch, which in the more sheltered valleys of that country—equally inappropriately named with Iceland—attain the proportion of little shrubs; and it is not until we come to the milder latitudes of the Pacific that the tree line, which had described a southerly curve in the cold regions of Central North America, again rises to the north, and until we reach the shores of Behring Straits, we find nothing that we can dignify by the name of trees.

The wooded banks of the Yukon touch the Arctic Circle, and forests of white spruce are found on the Noatak, a river which falls into Eschscholtz Bay, which infringes on the Arctic Circle. In Lapland the spruce ceases at about the sixty-eighth parallel, and the Scotch fir at the sixty-ninth; but in Norway, owing probably to the presence of the warm Gulf Stream, which sweeps along the coast and into the Arctic Sea—at least as far east as Novai Zemlai—we find forests of Scotch firs 60 feet in height as far north as Altenfjord, and birches about 45 feet high, in an equally northern latitude. In latitude 70 deg. 28 min. the hardy Scotch fir still maintains its ground, though the spruce falls a degree or so further south. In the vicinity of Hammerfest, a well known Lapland town, in latitude 70½ deg. north, there are dwarf Alders and Aspens, Bird Cherries, Rasps and Currants. In the Scandinavian Peninsula, probably also owing to the warmth which a sea, unencumbered, and in addition laved by a current of a higher temperature affords, barley is cultivated as far north as the seventieth parallel, the latitude of Disco Island, on the Greenland coast, and oats up to the sixty-fifth "in sheltered valleys where rocks and cliffs reflect the sun's rays with much power."—*The Countries of the World*.

T. P. ROBINSON, Phila.—There are so many of the Bamboos natives of India, that it is hard to say what the Calcutta Bamboo may be. Seeds of *Bambusa spinosa*, which attains a large size, were distributed freely last season here by Lieut. Gen. Strackey (British Army). This variety coming from up in the mountains, promises better for our Southern States than any from Calcutta. We do not find any of the varieties quoted in any of our seedsmen's catalogues, but will try to get some for you. Quite a number of the more hardy Chinese and Japanese varieties are cultivated for decorative purposes in England and the South of Europe. We remember seeing a fine collection at James Veitch & Son's Coombe Wood Nursery some five years ago, all perfectly hardy and very beautiful in

deed, planted as they were along a rivulet, the sloping banks being planted with the finer evergreens. Letter by mail.—Ed.]

II. S., Boston.—The spots on your Ivy leaves are the white scale insect, one rather difficult to eradicate when once it gets a firm hold; probably the best method is to pick off and burn the leaves most infested, and sponge clean those left with a strong solution of carbolic soap and water. Your plant will soon make new leaves, which keep clean by frequent syringing or sponging.

J. W.—Your plant is *Euphorbia marginata*, a native of the valley of the Mississippi, a very beautiful annual, often cultivated for ornament. As the seeds are quite hardy, it will grow again next season, from those that drop off, as they ripen. Another beautiful native variety is *Euphorbia corollata*. It is also perfectly hardy, and is herbaceous as well; the flowers have conspicuous white bracts, like a five cleft corolla, the whole plant very much resembling a large flowered Gypsophila, or Infant's breath, and well worthy of more general cultivation.—Ed.]

SANDWICH ISLANDS SURF BATHING.—It is very exciting, but the sea was not very rough. The surf board is a rough plank, shaped like a coffin lid, about two feet broad and from six to nine feet long. The men, dressed only in malos, carrying their boards under their arms, waded out from the rocks on which the surf was breaking, and, pushing their boards before them, swam out to the first line of breakers, and then, diving down, were seen no more till they reappeared as a number of black heads, bobbing about like corks in the water. What they seek is a very high roller, on the top of which they leap from behind, lying face downward on their boards. As the waves speed on and the bottom strikes the ground the top breaks in a huge comb. The swimmers appeared posing themselves on its highest edge by dexterous movements of their hands and feet, keeping just at the top of the curl, but always coming down hill with a slanting motion. So they rode in majestically, always just ahead of the breaker, carried shoreward by its mighty impulse at the rate of forty miles an hour, yet seeming to have a volition of their own, as the more daring riders knelt and even stood on their surf boards, waving their arms and uttering exultant cries. They were always apparently on the verge of engulfment by the fierce breakers, whose towering white crest was ever above and just behind him; but just as one expected to see them dashed to pieces, they either waded quietly ashore, or, sliding off their boards, dived under the surf, taking advantage of the undertow, and were next seen far out at sea, preparing for fresh exploits. The great art seems to be to mount the roller precisely at the right time, and to keep exactly on its crest just before it breaks.

EATING FRUIT.—While few articles of food are more or less injurious than unripe fruit, still it is almost impossible to take too many of those that are ripe, fresh and perfect when eaten in their natural state. The earlier in the day fruits are eaten the better. Their healthful qualities depend on their ripe acidity, but if sweetened with sugar not only is this acidity neutralized, but the stomach is tempted to receive more than it can digest, and if cream be taken with them the labor of digestion is increased. No liquid of any description should be drunk within an hour after eating fruits, nor should anything else be eaten within two or three hours after. Thus, time being allowed for them to pass out of the stomach, the system derives from them all their enlivening, cooling and aperient influences. The great rule is, eat fruits and berries while fresh, ripe and perfect in their natural state, without eating or drinking anything for at least two hours afterward. With these restrictions, fruits may be eaten in moderation during any hour of the day, and without getting tired of them, or ceasing to be benefited by them during the whole season.

THE ORIGIN OF THE GREAT LAKES.—At the late meeting of the Scientific Association in Buffalo, a paper was read by Prof. Newberry, attempting to explain the origin of the great lakes of this country. He asserts the sequence of events in the formation of the great lakes to have been as follows:

1. The Laurentian belt north of the great lakes, which has been a land surface since the beginning of the Paleozoic era, was formerly a high mountain range, the degradation of which has supplied the mechanical materials which compose the sheets of Paleozoic rock that surround it. The erosion of these highlands has continued uninterruptedly till the present day, and was specially rapid during the period.

2. Previous to the glacial period, the elevation of this portion of the continent was considerably greater than now, and it was drained by a river system which flowed at a much lower level than at present. At that time our chain of lakes—Ontario, Erie and Huron—apparently formed portions of the valley of a river which subsequently became the St. Lawrence, but which then flowed between the Adirondacks and Appalachians, in the line of the deeply-buried channel of the Mohawk, passing through the trough of the Hudson, and emptying into the ocean, eighty miles southeast of New York. Lake Michigan was apparently then a part of a river course which drained Lake Superior and emptied into the Mississippi, the Straits of Mackinac being not yet opened.

3. With the approach of the cold period, local glaciers formed on the Laurentian Mountains, and, as they increased in size, gradually crept down on to, and began to excavate, the plateau which bordered on the west and south. The excavation of our lake-basins was begun, and perhaps in large part effected in this epoch.

4. As the cold increased and reached its maximum degree, a great ice-sheet was formed by the enormously increased and partially coalescing local glaciers of the former epoch. This many-lobed ice-sheet or compound glacier moved radiantly from the south, southwest, and western slopes of the Canadian highlands, its Ohio lobe reaching as far south as Cincinnati. The effect of this glacier upon Lake Erie and Lake Ontario would be to broaden their basins by impinging against and grinding away with inconceivable power their southern margins.

5. With the amelioration of the climate the widespread ice-sheet of the period of intensest cold became again local glaciers, which completed the already begun work of cutting out the lake basins. At first, the glacier which had before flowed over the watershed in Ohio was so far reduced as to be unable to overtop its summit, but, deflected by it, it flowed along its base, spending its energies in cutting the shallow basin in which Lake Erie now lies.

6. The melting of the glaciers was accompanied, perhaps, occasioned by a sinking of the continent, which progressed until the waters of the Atlantic flowed up the valley of the St. Lawrence to Kingston, and up the Ottawa to Amprior The valleys of the St. Lawrence and the Hudson were connected by way of Lake Champlain, and thus the highlands of New England were left as an island. It is also possible that the sea-water penetrated to the lake basin through the valley of the Mohawk, and through that of the Mississippi, but of this we have no evidence in the presence of marine fossils in the surface deposits. The great area of excavation in which the lakes lie was probably at this time filled to the brim with ice cold fresh water.

## Sea and River Fishing.

## FISH IN SEASON IN SEPTEMBER.

| FRESH WATER.                               | SALT WATER.                                      |
|--|--|
| Trout, <i>Salmo fontinalis</i> .           | Sea Bass, <i>Selenops ocellatus</i> .            |
| Salmon, <i>Salmo salar</i> .               | Sheepshead, <i>Archosargus probatocephalus</i> . |
| Salmon Trout, <i>Salmo confinis</i> .      | Land-locked Salmon, <i>Salmo gairdneri</i> .     |
| Grayling, <i>Thymallus tricolor</i> .      | White Perch, <i>Morone americana</i> .           |
| Black Bass, <i>Micropterus salmoides</i> . | Weakfish, <i>Cynoscion regalis</i> .             |
| <i>M. nigricans</i> .                      | Bluefish, <i>Pomatomus saltatrix</i> .           |
| Masouline, <i>Esox nubilus</i> .           | Spanish Mackerel, <i>Cybinus maculatus</i> .     |
| Pike or Pickerel, <i>Esox lucius</i> .     | Cero, <i>Cybinus regalis</i> .                   |
| Yellow Perch, <i>Perca flavescens</i> .    | Donito, <i>Sarda peltamus</i> .                  |
|  | Kingfish, <i>Menticirrhus nebulosus</i> .        |

FISH IN MARKET.—Fish continue plenty, and prices are still down, as will be seen from our quotations for the week which are as follows:

Striped bass, 18 to 20 cents per pound; smelts, 20 cents; bluefish, 8 to 10 cents; salmon, frozen, 30 cents; mackerel, 15 to 25 cents; weakfish, 10 cents; Spanish mackerel, 18 cents; green turtle, 15 cents; terrapin, \$18; halibut, 15 cents; haddock, 6 cents; king-fish, 25 cents; codfish, 8 cents; black-fish, 15 cents; flounders, 8 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 8 cents; soft clams, 30 to 60 cents per 100; Salmon trout, 12½ cents; sheepshead, 25 cents; whitefish, 15 cents; sunfish, 10 cents; yellow perch, 10 cents; hard shell crabs, \$3.50 per 100; soft crabs, \$1.50 per dozen.

MASSACHUSETTS.—East Templeton, Aug. 20.—Occasional strings of trout are caught, but they run rather small. A friend recently caught seven, ranging from fingerlings to three-quarters of a pound. Black bass, which were introduced into the ponds in this section from three to five years ago, are now affording fine sport. C. E. G.

Newburyport.—A live seal, weighing 15 pounds, was captured in a seine at Plum Island Point recently.

CONNECTICUT.—Niantic, Aug. 19.—Is there any law in this State regulating the size of meshes in nets used along the coast? I should think that the Fish Commissioners might do something to prevent the wholesale slaughter of fish too small for use. Sport here is most miserably dull, all owing to the abominable nets that stretch across the harbor, taking everything that comes along. Occasionally, by singular good fortune, a bass manages to get as far as the bridge and bless us with a bite; even this is a relief, and for one fisherman loses his bait, immediately a rush is made for our rods, each being anxious to capture the striped beauty. The best luck so far has fallen to the lot of Mr. J. J. Le Count, he landing four one day, smallest 4 lbs., largest 7 lbs. Your humble correspondent has caught but one, weight too small to mention. At Konomac good sport is had with the black bass and pickerel. I am glad to see the boys of New London are repenting of their evil ways, and some of them having taken to reading your valuable and entertaining paper, I feel sure they will abandon their poaching and piratical practices. SOALES.

[There is no law regulating the size of mesh; but the law forbids any bass, pike, pickerel or muscalonge being taken otherwise than by hook and line.—Ed.]

NEW YORK.—Waterville, Aug. 28.—I have just returned from a campaign expedition on Chataqua Lake, N. Y. The fishing in Chataqua Lake at this season of the year is not good. Even the professional fishermen would not average more than one pickerel a day. It is too late for bass, and I only know of two bass being caught during my two weeks' stay. Nothing as yet has been seen of the salmon trout with which Seth Green stocked the lake three years ago. I could not find any one who had ever seen one. Perch in Chataqua, seldom if ever, grow to be more than half a pound in weight. All in all I don't know a poorer place for fish in August than Chataqua Lake. HARRY N.

New Rochelle, Aug. 31.—A live dolphin six feet long and weighing over five hundred pounds was caught off New Rochelle on Tuesday last and has been added to the Aquarium collection.

PENNSYLVANIA.—Sharon, Aug. 27.—James Roy succeeded in capturing nine black bass with the fly last Saturday evening between sunset and dark. He had on two flies, a red bib and a gray one, made from a drake's wing. He hooked two at one cast, and landed them safely. This was done right in town, where the river (the Shenango) is "fished to death." TOMMY.

Sharon, Pa. Aug. 20.—In your issue of last week (Aug. 16), A. W. F., Orangeville, Ohio, says he can see bushels of black bass in the Pymatuning, when the water is low, and has tried to take them with minnows, artificial flies, soft shell crabs and red flannel after night, but in vain. Perhaps A. W. F., does not understand the way to fish with the fly, and perhaps the bushels of bass that he sees are suckers.

Orangeville, Ohio, is only eight miles from here. I have caught a great many bass in the Pymatuning, with the fly, but I have not been up there this season yet. It was only last Saturday evening that I caught seven bass with a red fly—no flannel—the largest weighing 14 pound. If A. W. F. would put on two flies, a red one and a white one, and commence fishing at sundown, I will warrant he will take bass, provided there is bass where he fishes, and he uses the flies right. I remember two years ago a friend of mine, Mr. H., asked me for a couple of flies, as he wanted to try that kind of fishing. I gave him my casting line, and the same flies that the day before I killed thirteen bass with, ranging from ¼ to 2 pounds

He went to Fruit's Mill where I got the thirteen the day before, and when he came home in the evening he showed me the largest black bass I ever saw—54 pounds—he had five or six others. I said to him, "Mr. H., you have done very well, did you get those bass with the fly?" "No," he said, "I got them with the minnow, they wouldn't bite at the fly to-day at all. I fished till three o'clock, and never got a bite, then I set the flies and went away to get some minnows, and I got all these bass with the minnow." "You set the flies, how did you set them?" I asked. "Why, I threw them into the river and put a stone on the butt of my pole, and went up the run after minnows." I learned from him that he fished with the fly in the same manner that he would fish with the minnow or crab, i. e., throw them in and let them stay there a while.

ROD RAY.

MARYLAND—*Baltimore, Aug. 25, 1877.*—In the FOREST AND STREAM of Aug. 23, in "Our Washington Letter," the writer speaks of excellent bass fishing in the Potomac, Shenandoah, etc. Now, I took a trial at bass fishing on the Potomac, at Little Georgetown, down to Coulson Mill or Dam No. 5, and in the two-days' fishing did not catch half a dozen fish, though I used grasshopper, minnow, flies, helgramites and toads, and got myself blistered by the sun, and wore my pantaloons out sitting on the edge of the dam. There were around me at least a dozen men fishing, and also an out-line across the dam with thirty hooks on it, and I saw two men go to that out-line five times and catch nothing. There was pointed out to me a man that had been fishing the day before and caught nothing, and he had only caught one that day I was there. The two-days' fishing amply repaid me, for I enjoyed the air of the mountains and the magnificent scenery and the burning sun; for one can enjoy such luxuries when they can leave their business only for two days; but when your correspondent writes of the excellent fishing in the Potomac I feel rather lachrymose at having been up there and not found it. I would like to know at what particular locality he found the bass. I got off at North Mountain and fished from Little Georgetown down to dam No. 5.

JOHN GEORGE.

MICHIGAN—*Detroit, Sept. 1.*—On the 28th ult. Joseph Antes, L. W. Tinker and George Foot caught 60 perch and 7 black bass at the St. Clair Flats, in four hours' fishing. August 29, Mrs. T. McGraw caught 22 fine black bass. August 30, Mr. Billings, of Ann Arbor, H. M. Dean and Jessie Farwell caught 58 perch and 18 black bass. August 31, Judge Durfee, Thos. McGraw and Louis Hallcock caught 38 black bass; one that the Judge caught weighed five pounds.

Green Day.—The *Advocate* thinks the sponge fish has been discovered in the bay.

WISCONSIN.—*Westboro Station, Aug. 27.*—The best sporting place near here is twelve miles west. There is a road to it, and a family living in an old logging camp who have plenty of room for twenty men. The Jump River is within one mile of this camp, and is the best place for muscalonge by all means; are caught as fast as they can be pulled out, and are all large, ranging from five to twenty pounds.

OREGON—*Portland, Aug. 24.*—It is generally believed that the Utah trout in Provo River are not known to rise to a fly. This is incorrect. In 1870 I was an officer in the 13th U. S. Infantry, and was stationed at Provo, from the latter part of July until the May of the following year. I put in my spare time in fishing, and caught a great many trout. I used nothing but artificial flies, and caught as many as any one else—and larger fish than any. One was five pounds. The flies I had best luck with, were from William Read & Sons, of Boston, which they called a grasshopper—green body, red tail and gray, brown mottled wings.

Since I have been here have not had time to go fishing, but live in hopes. There are plenty of fish in the streams away from the city.

W. V. S.

MONTREAL, Sept. 1.—Mr. J. H. Stearnes, of the Albion Hotel, had fine sport recently in the Ottawa River, near Vandrell, using a light trout rod and phantom minnow. Among the numerous fish that he killed were a ten-pound catfish and a large muskalonge, which made a two hours' fight of it before he yielded to mine host's plaint 12-o'z. green-heart.

SANSTEAD.

CANNING SALMON.—The salmon industry of the Columbia River employs 10,000 people in its various branches; the value of the export this year is estimated at \$5,000,000. The *Pacific Rural Press* gives this account of the process by which the fish are prepared for exportation:

Just as soon as the fish are caught, if not drowned in the net, they are killed by a blow on the head. The average weight of salmon is twenty pounds. When brought to the cannery the fish are piled upon the wharf, and we have seen 4,500 salmon in a single pile. From this pile they are taken to a trough, thoroughly washed and placed on a long table; here, with a single blow of a huge knife, the head is slashed off; with a single motion of a similar knife, the fish is split open and disemboweled. The head and entrails are thrown away at many of the fisheries; at some of them, however, they are made into a very good article of oil. After the fish are cleaned, they are thrown into brine vats, where they remain for a time—this process is known as salting; they are now taken and placed, one at a time, on a small table with a cutting attachment, and with a single stroke of the lever, the fish is cut into exactly the proper size to fit the cans.

Another set of hands take these bits of fish, place them deftly in the cans, whence they go to other workmen, whose duty it is by means of an apparatus, to put in each can a small amount of brine, for canned salmon have nothing else in it. Now, the cans filled with the raw fish, pass to workmen who apply the lid and solder it on. Next, the cans are placed, hundreds together, in iron rings, or, in some of the canneries, into iron squares, each form holding about 600 cans, and by means of cranes all are lowered into steam boilers, where they are cooked for an hour. Now, quite a nice operation takes place, similar to that employed by the champagne-wine manufacturers, which is called venting. A hole is pricked in the top of the can, and the air and gases generated are allowed to escape, when the little vent-hole is instantly resoldered. A second cooking now takes place, when the culinary portion of the canning is ended. The cans are again taken from the boilers, and are showered with cold water. If the vacuum is perfect and the package sound, the top of the can caves in and assumes a concave form.

CLUB HOUSE, BLOOMING GROVE PARK, PIKE CO., PENN., Aug. 30.—We have among our guests one Mrs. Hardie, of New York, who, though only an amateur fisher, has far excelled the old sportsmen this year. After breakfasting this

morning on some fine large cat fish caught by herself with her pretty bamboo rod, she and little Charlie Daggett, an interesting lad of some six summers, started off for "Bass," the proprietor of the club house being in close proximity on the lake in another boat. Little Charlie caught the first bass, weighing two pounds and a half, with only a drop line and trout fly, while Mrs. Hardie, taking great precaution not to lose any of her favorite bait (bull frogs), rowed off to a sequestered spot and caught the greatest number of bass caught at any one time this season, the largest weighing a little over three pounds. Her merry laugh and cheerful face must have enticed the fish. She enjoys fishing, rowing and croquet hugely, and all are constantly seeking her society for the purpose of enjoyment and indulging in her favorite game of "cassino."

Mrs. H. is about to leave us next week. The ladies, children, and particularly the gentlemen, will, I know, exceedingly regret her departure, she being the "life" of the house during her sojourn here. To-day we start off again, a prize to be awarded to the best fisher, or in other words whoever catches the most bass on Lake Giles.

A MEMBER.

A BIG HAT OF SHARKS.—A citizen of Dare county, N. C., one day last fall made a haul with his seine in the ocean, and caught 102 sharks. The seine was only 280 yards long, and he says that twice as many sharks got away as he landed.—*Ellenton Times.*

[This beats "four of a kind."]

—Large quantities of blue fish are now in the Great South Bay. The fishermen are satisfied that the pound nets have kept them out heretofore, and they are making more money with hand lines than they did with their nets, as blue fish were seldom caught in them. The catch for the past week has averaged very high, some boats taking 175 to 200 per day.

ALLIGATOR IN DETROIT RIVER.—On the 20th ult. Alex. Campen discovered an unknown animal in the Detroit River, near Belle Isle, which he took to be a veritable sea serpent. After expending considerable powder and shot, the saurian was captured, and proved to be an alligator, upward of five feet in length. The capture of such an animal in these waters was a matter of considerable comment, until it was discovered that it had escaped from the aquarium of Henry Wesson Hantramam some two weeks previous.

—The Earl of Dunraven is in New Brunswick, on a fishing tour.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals the past week has been 75, as follows: Banks, 14; Georges, 37; Bay St. Lawrence, 5; Greenland, 1; shore mackereling, 18. The receipts of mackerel have been 1,000 bbls. from the Bay, and about 300 bbls. shores; codfish, 925,000 lbs. Bank, 550,000 lbs. Georges; halibut, 470,000 lbs. Bank, 22,000 lbs. Georges, 100,000 lbs. fletched from Greenland.—*Cape Ann Advertiser, Sept. 1.*

GRAYLING FISHING ON THE SAUBLE.—As the best time for grayling fishing is said to be September, and as that time is drawing near, I will for the benefit of your readers who are that way inclined, relate the experience of three fishermen, who, having heard good rumors of the game qualities of that fish, and the great numbers of them to be found in the Ausable, concluded to test these reports. The outfit in boats, etc., was quite a problem, none of us having ever seen the head waters of the stream; hence we knew not the kind of a boat needed. We finally decided on a flat-bottomed one, fifteen feet long and three feet in beam, which, with the supplies and equipage, was shipped in advance to Otsego, on the Jackson, Lansing and Saginaw R. R. At this point we learned that there would hardly be enough water in the North Branch for the purpose of navigation, and were advised to go into Chub Creek, a tributary of the same and much deeper. Following that advice, and an ox team through the woods for about six miles, we entered the creek below Dam 1, and proceeded to find our way down a stream of which we were totally ignorant. I will here explain the use of these dams and the impediment they offer to navigation. They are built for the purpose of raising a head of water to float logs down the stream when the natural supply is not sufficient for that purpose, and when they are not in use there is little trouble in getting over them, as the sill is as near the natural water as is possible to be. The trip down the stream was delightful, and water plenty, with the exception of a short piece below the dam. Ducks and grouse were found in abundance, and killed as needed, as we floated along. The number of deer tracks seen indicated plenty of that kind of game. Our first deer was seen soon after starting, but, as the guns were in their cases, it got off in safety, and threats as to the fate of the next one were in order. A few miles down the stream we passed through Chub Lake, a beautiful little sheet of water, well stocked with black bass, but as we were after grayling, we passed on, entering the North Branch, where our troubles commenced. Here the water was so shallow that we had to tow our boat the greater part of the afternoon; passed Dam 2 without much trouble, and camped at dark in a cedar swamp. Sunday morning came, and as two of the party had scruples about running farther that day, the tempter came in the shape of our chum Jim, who suggested that we put the things into the boat, keep its nose out of the bank and let it run itself. Not knowing what was before us, and not having reached our fishing ground, the temptation was strong and we fell; but mark the sequel! We had not been long on the way when we got aground, and as Jim had been the cause of our starting he promptly got out and towed us over, when H. and I left him to run the boat down to Dam 3, agreeing that the party reaching the dam first should wait for the other; so we parted company, but missed the dam, and after what seemed a fourteen-mile walk we struck the river at a dam, but failed to find the boat. Something had to be done to appease hunger, as it was now near night, so we rigged a fly-rod out of a birch sapling, and proceeded to ascertain the number of the dam, as we had been assured

that we would not find our fish until we reached Dam 4. The first cast was productive of nothing, and our prospects of a supper were poor. The next brought a fine rise and a catch, and on landing it we beheld our first grayling, and in accordance with previous information we were forced to conclude that the boat was, like the Indian's wigwag, lost. However, in less than half an hour we had plenty of grayling for supper. In all my experience I had never found fish so numerous, and so willing to be taken, two at a time being quite a common occurrence. Fly fishing was a new thing to H. who watched the proceedings with great interest and conflicting emotions. On Monday he made his maiden effort, and as he thought, all alone, having made a good fire to keep me comfortable and asleep while he did so. On awakening I missed him, but soon found him up to the thighs in a beautiful pool doing nicely, having caught seven beauties. His opinion on fly fishing was that it beat anything that he had ever tried. To find Jim and the boat was the next thought.

After breakfasting on "planked grayling," we started up stream, and after a long and tiresome wade, Jim was discovered keeping her nose out of the bank, and greeted with a shout that made the welkin ring. We boarded him, and running down to Dam 4, landed our duds, and were soon quite happy over a good cup of coffee, relating the experiences of the past twenty-four hours. Fishing now commenced in earnest; after a short trial we found that only a small portion of each day could be devoted to that sport, unless a great many fish were wantonly destroyed. The grayling affords sport equal to the *Salmo fontinalis*, but possessing a smaller and more tender mouth, requires a small hook and more careful handling. From Dam 4 to where the North Branch joins the main stream, there are beautiful pools nearly all the way, with fine gravelly beaches, affording good casting room and a fine opportunity for landing fish without the aid of a net. We spent a week very pleasantly between these points, but I cannot give the distance, as the river is so crooked it would only be a guess. From the junction down, the fishing is best done from a boat, and on that account is not so pleasant. Having spent ten days fishing we started from Big Creek of the main stream, five miles below the junction, for Lake Huron, which we reached Sept. 22d, having spent thirteen days on the stream.

As this is already too lengthy, it would be imposing too much on good nature to relate the many laughable incidents that occurred; how Jim heard a bear foraging in our larder one night, when, slipping out rifle in hand, he saw it take cover under a leaf; how the stew got into the fire, etc. Parties who do not wish to go as far as Otsego can enter the main stream at Grayling station and reach good fishing in a short time; by following this route they will find excellent fishing at the mouth of Big Creek. At Otsego there is a good hotel, and if it is not convenient to bring a boat there will be little trouble in having a punt built which will answer every purpose. When once on the stream they will be charmed with its beauty and more than charmed with its swiftness and the excellent fishing it affords. A party of five, including the party of last year, will try it again in September, and in due time you will learn the result.

QUIN.

Port Huron, Mich., Aug. 18, 1877.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, configuration to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

ST. LOUIS DOG SHOW.—The Second Annual Bench Show will be held under the auspices of the St. Louis Fair Association in this city, Oct. 3 to Oct. 5, for sporting and shepherd dogs only. Lincoln has been engaged as manager, and Mr. John Davidson's services as judge have been secured. Chas. H. Turner is kindly giving his time and attention to the details of the coming show, but the dogs of the St. Louis Kennel Club will not be entered for competition. A thousand dollars in cash for prizes has been given by the Fair Association. The catalogues will be out in a few days and can be had, with all particulars, by addressing C. H. Turner, Fair Association, St. Louis. Our fair of itself is worth coming from the East to see, but to dog owners the show ought to be attractive enough to bring them out in force. Our Western men attend the Eastern shows generally, and we want our Eastern friends to come out and see us. Railroad fares will be reduced. Any one coming from the East to exhibit here will meet with a hearty welcome from St. Louis sportsmen.

J. W. M.

THE BOSTON DOG SHOW.—The exhibition opened at Music Hall, September 3d, and has already attracted thousands of people, who come and see and go away perfectly satisfied. It is, indeed, the best exhibition in New England, and compares favorably with the bench shows of other cities. Upwards of two thousand visitors were admitted on Monday, and the number was largely increased Tuesday and Wednesday. The owners of Boston dogs, with an eye to their comfort, remove their animals each night, returning them in the morning, at which time it is worth one's while to view them, numbers arriving at the same time. Some are full of life, and evidently anxious to mingle with the howling, yelping, growling throng, while others, as they hear the disturbance, tug at their tethers, and exhibit their displeasure by barks and yelps. More quiet was noticeable Wednesday, the canines having evidently become somewhat reconciled to their position. The house pets seem least willing to be comforted, although they receive a great deal of attention from lady visitors. It is interesting to watch the people making the grand rounds, and a close student of human nature soon selects the admirers of each of the numerous breeds represented.

NAME CLAIMED.—I hereby claim name of Ned II. for my red Irish setter dog, by Lakin's Ned, out of Dunham's Jessie. *New York, Aug. 29.*

R. RUSHMORE.

**NAME CLAIMED.**—I claim the name *Island Belle* for my black and tan Gordon setter bitch, by Dr. Aten's Glen, out of Fisher's Border Lily, whelped June 26, 1877.

CLINT WISNER.

—I claim the name of *Friend II.* for my Irish Gordon bitch—color, red, with white markings, out of Geo. Payner's Fan by Arnold Burges' champion Rufus, whelped April 20. Also, the name of *Bob* for my dog puppy, out of Von Oulin's Moll II., by Rufus II., whelped June 4th and is deep red, no white.

Pittsburgh, Pa., Sep 3. F. A. TREMAINE.

**DOG SWIMMING MATCHES.**—This is a novel form of sport lately introduced among the dog fanciers of San Francisco. The course is from Rock Island to Long Bridge, and the winning dog is decorated with a silver collar. At a late match, the victor, a great black dog, bore the euphonious name of "Pedestrian Jimmy."

**NAMES CLAIMED.**—We claim the following names for our Rufus-Belle pups—all red, no white: Red Cloud, Eclipse, Crusader, Admiral, Mystery, Primrose, Pamela, Necuba; also the following names for our Gordon setter puppies, whelped out of our Border Lily, by Dr. H. F. Aten's Glen: Tarquin, Dorset, Oxford, Charon, Gaity.

Brooklyn, N. Y., Aug. 29.

FISHER & BRICKENTON.

—The dogs of Jacksonville, Florida, have been poisoned wholesale. A reward of \$100 has been offered for the discovery of the party who did it.

## New Publications

**THE SPORTSMAN'S GAZETTEER.** By Charles Hallock, New York. FOREST AND STREAM Publishing Co., 1877. Price, \$3.00.

We propose to take advantage of Mr. Hallock's absence to have our say about his new book, and so feel at liberty to say some things which, were he here, might not be allowed to appear.

There had long been felt among sportsmen the want of a comprehensive, reliable work of reference, which should give information upon the various subjects of natural history, and other matters pertaining to a sportsman's life. When, therefore, some time since, Mr. Hallock intimated his intention of supplying such a book, the announcement was received with very general satisfaction. His eminent qualifications for such a task were well known and need slight mention here. 'Himself an enthusiastic devotee of the rod and gun, and a practical sportsman, his personal experience in the camp and on the cruise have been wide and varied. His wanderings have extended to every more important fishing and hunting localities in the United States and Canada. Many of these travels have borne fruit in frequent and racy contributions to the magazines, and it may be here mentioned that many of these articles—notably that on Labrador, written years ago for *Harper's*—are still referred to as authoritative. His position for several years at the head of this journal has made him familiar with the every need of a sportsman, and admirably fitted him for the preparation of a sportsman's encyclopedia. A wide circle of acquaintances, moreover, afforded peculiar facilities for supplementing his own information by that of the best authorities and the most intelligent observers throughout the country. All these, together with the well known thoroughness and care which mark all of Mr. Hallock's editorial and literary work warranted us in anticipating and demanding that the *Gazetteer* should be comprehensive, clear and practical, and, above all, strictly accurate.

Now that the book has appeared and is entering upon its second edition, it may not be amiss to ask with what success the author has filled these high expectations.

And first we may say that in all these three particulars, the work has been to us a constant surprise and marvel. Into this handsomely printed and attractive volume of 900 pages has been condensed satisfactory information upon every conceivable subject that would come within the legitimate scope of the work. Every game, animal, bird and fish of every State, territory and province in North America is here clearly and concisely designated and described, with its scientific, popular and local name, specific characteristics, habits and every truly sportsmanlike method of its capture. The subsequent chapters devoted to blinds, decoys, and all other matters pertaining to hunting, and to hooks, lines, flies, fly-tying and the other branches of the piscatorial art are marked by the same full, clear, and eminently practical treatment. We have already expressed our high appreciation of that part which is devoted to the selection, care and management of the dog, and need only add here that subsequent investigation and practical tests confirm the opinions before expressed that the sound sense and evident care with which these pages are prepared make this the best and most reliable extant treatise on the dog. The shot gun, rifle, sporting boat and canoe, and every implement and utensil employed for sporting purposes are discussed, and the most specific directions given for their use and care; while in the chapters devoted to woodcraft, taxidermy, and hints for camp and cruise, information is given upon a variety and range of topics, of which the bare enumeration and range would exceed our space. Perhaps the most vulnerable portion of the book is the Second Part, of two hundred closely written pages, which are taken up with a Sportsman's Directory to the different fish and game resorts of the various States and counties. The migrations and yearly variations in the game of any given locality renders the attempt to give specific local information somewhat hazardous. The fact, however, that the Directory is constantly receiving the indorsement of local critics affords evidence that even here the author has not gone amiss.

In short, Mr. Hallock has prepared a book which is a complete guide for the young sportsman, and an instructive and congenial companion for the old and experienced—a *cade mecum* for the camp and cruise; a work which is complete, and must long remain the standard authority and book of reference on all sporting matters.

*Harper's* holds a very large and a very secure position in the heart of the magazine reading public, and we doubt if this place, gained long ago, could ever be satisfactorily filled by any of the younger candidates for popular favor. Certain it is that the readers of *Harper's* have nothing to complain of this month, either in the variety or the amount and general excellence of the matter furnished them. There are eight illustrated articles and two poems with illustrations. "The Lad of a Ship" is described by Ernest Ingersoll, who finds poetry in the strange depths of the bonded warehouse. In "American Workmen from a European Point of View" Leonard W. Bacon discusses the influence upon Swiss workmen of the American exhibit at Philadelphia. Edward Howland has "A Railroad Study," and W. H. Herriek contributes a most timely article upon "General Stark and the Battle of Bennington." Other articles are "A Group of Classical Schools,"

"Large Schools vs. Small Schools," "Prince Edward Island," "Mount Shasta," a paper on thermometers, by Dr. Draper, and another on Tom Moore's visit to America, by Benjamin J. Lossing. There are three short stories, besides the continuation of Blackmore's serial, "Erema."

**Scribner's.**—The series of articles discussing American sports have become a recognized and most enjoyable feature of that delightful monthly. The papers which have already appeared are: "Salmon Fishing," by A. G. Wilkinson, in September, 1876; "Bay Shooting," by T. Robinson Warren, in December, 1876; "Trout Fishing in the Rangeley Lakes," by Edward Seymour, in February, 1877; "Some American Sporting Dogs," by Wm. M. Tilston, in April; "Sea Trout Fishing," by A. R. MacDonough, in June; "Bow Shooting," by Maurice Thompson, in July, and in the Mid-summer Holiday Number were very interesting papers on "North American Grouse," and "Canadian Sports." Perhaps none of these papers has secured more general attention than that on archery, by Mr. Thompson, which has really been the cause of a promised revival of that ancient and worthy pastime. In the September number Mr. Thompson, in reply to a large number of letters upon the subject, gives the following rules for shooting:

"Your bow being first strung or braced, hold it horizontally before you, i. e., with the bow at right angles with your body, your left hand firmly gripping the handle; slip an arrow under the string and over the bow at the right edge of your left hand and touching the left forefinger knuckle; place the arrow nock well on the string; turn the palm of your right hand up, placing the first three fingers thereof under the string, hooking their tips round it with the arrow between the first and second, and the thumb extended along the shaft near the nock. Now, keeping all holds thus, turn the bow till it stands vertically before you, your arrow resting against and above your left forefinger knuckles; turn your left side to the target, fix your eyes steadily on the center of the bull's-eye, draw the string back till your right thumb touches the upper tip of your right ear; squeeze the bow-handle powerfully with the left hand, steady! let drive! Now, if you have paid good heed to the above directions and have been sure to keep the arrow nock well on the string, you have made a pretty shot. Do not attempt to take aim, do not even think of guiding your arrow with your eye. The only way to become a good bow-shot is to learn to guide your shaft by feeling, i. e., by your sense of direction and distance. Your eyes must be glued, so to speak, upon the target. This is the one great rule of archery. Any other will lead to slovenly and wild, irregular shooting.

Future papers in course of preparation are promised on "Moose Hunting"; "Fox Hunting in New England"; "Duck and Terrapin," and other subjects equally of interest to the sportsman and vacation pleasure seeker. The September number contains among other good things—papers on "The Immigrant's Progress," "The Fan," "The Land of the Arabian Nights," "Old Streets and Houses of England," "An Island of the Sea," "Port George Island, Florida," "Wells and Cisterns as a Source of Water Supply," and "Microscopical Corals."

The Ferns of North America is the title of a work soon to be issued by S. B. Casno, Naturalists' Agency, Salem, Mass. The work of a carefully prepared and thoroughly illustrated work on the American Ferns, has long been felt by those studying these cautious plants. As yet, no work whatever has made its appearance which contains even a description of all our American species, and the few that have been figured at all, are found scattered through so many foreign works that it is quite impossible to find them, even in an excellent library. The subscription price will be \$1.00 per part, which, it is believed, is lower than work of the same nature and quality yet published.

## Answers to Correspondents.

### No Notice Taken of Anonymous Communications.

O., Wisconsin.—We do not know the party you mention?

W. C. T., Port Henry, N. Y.—Your description is too meagre to judge from.

J. M. D., Irwin Station, Pa.—Description too meagre. See head of our kennel column.

D. B. B., Scranton, Pa.—Your description is too meagre. See note at head of kennel column.

E. G. P., City.—We have had no experience with the tackle you speak of, but see no reason why it should not be available.

J. M. H., Phila.—Where can I obtain a bicycle and at what price? Ans. Peck & Synder, Nassau St., city. Prices vary from \$20 upward.

F. R. H.—Will you please give me the price of a copy of the *FOREST AND STREAM* that has the method of embalming deer heads? Ans. 10 cents.

W. N. R., Bethel, Conn.—What hunting will I find around Milan in Sullivan Co., Mo., and fifty miles further West? Ans. Grouse, wild fowl, etc.

E. S. W., Corning, N. Y.—Can you recommend a book on the treatment of dogs? Ans. Hallock's "Gazetteer." Price \$3.00. For sale at this office.

A. H. S., Marshall, Texas.—Be kind enough to let me know where I can get Laverack's work on the setter? Ans. Parker Brothers, West Meriden, Conn.

B. F. J., Kansas City, Mo.—Can you tell me where and from whom I can get genuine shepherd dogs? Ans. Write to F. Bronson, 76 Wall street, New York.

S. S. B., New York.—Please inform me what kind of duck shooting one may have on Canandaigua Lake about September 15. Ans. Very little sport is to be had on Canandaigua Lake.

A. B. C., Nahant, Mass.—Will you kindly inform me what Mr. Hallock intends to sign his pieces from the West that I may know when I read his? Ans. Look at the paper and you will see.

T. M. O., Woodstock, Ohio.—What is the best kind of metal for a breech-loading shot gun? Ans. Damascus is so considered, though laminated steel is, in the opinion of many, equally as good.

E. C. M., New York.—Please be kind enough to inform me in next issue of a suitable place to go gunning on or about November 6, say four or five hours' ride from New York city, ducks preferred. Ans. Go to Barnegat Inlet, N. J., or to Lane's Good Ground, L. I.

J. G. M., New York.—Is 3 drachms of powder and 1½ oz. No. 8 (Tatham's) shot heavy enough for Bogardus' glass balls? Ans. Add half a drachm more of powder if needed, and use but one ounce of shot. Bogardus uses 4 to 5 drachms powder and 1½ shot in 10 gauge.

M. S. N., Johnstown, N. Y.—Our sportsman's club have bought a Bogardus trap. Please tell us how to use it. What distance from marksman should it be sprung? Should marksman stand in rear or right angles? What amount and size shot to use, etc. Ans. See our last issue for Bogardus' rules, etc.

W. L. A., Philadelphia.—1. Were there any indigenous mammals in Bermuda? 2. Are all the bears of the United States now considered to be varieties of *Ursus arctos*? 3. Have there been any jaguars killed within the limits of the United States of late years? Ans. 1. Yes. 2. No. 3. Yes.

B., Collinsville, Conn.—I want something with which to condense fresh from sea water while coasting on a schooner about Florida. Have you knowledge of a practical condenser for the purpose? Ans. Yes. If you are in the city and call we will be happy to explain, but cannot afford the space here.

E. A. L., East Bridgewater, Mass.—I would like to know if there are any of the true old thick-skinned, staunch and s'ow-working, Spanish pointers in the U. S., and if there are who is the owner and breeder of them? Ans. Yes, but we do not know of any one who has them for sale at present.

H. C., New Berlin, N. Y.—Have the Supervisors the right to lengthen the close season on partridge in the State? They have made the close season in this county (Cheungo) Sept. 15. What I want to know is will I be liable for killing between the first and the middle of Sept. on account of the Supervisor's laws. Ans. Certainly they have; and if you violate the provisions you should be punished.

C. E. J., East Templeton, Mass.—1. Very good. 2. Arsenical soap is easier bought than made. There are different ways of making it, one of which is to melt some clear soap and stir in arsenious acid; but pure arsenic is every way to be preferred for preserving specimens, being less injurious to the work.

MILLER & SMITH, New York.—We cannot give you estimates as to stable, stable gear, harness and carriages, as such depends entirely upon the tastes and demands of the purchaser. As regards diseases of horses, the works that are considered as standard are too numerous to mention. Youatt is one of the very best, though a little antiquated.

TOMAH, Tomah, Wis.—Should the trap lie in a horizontal position on the ground? Can you tell size of shot Capt. Bogardus generally uses in shooting the balls? We have placed our trap on a plank and inclined the plank at an angle of say 10 degrees. Is there any rule against this? Ans. 2. Capt. Bogardus shoots No. 9 shot. 3. No, it is frequently done. This answers your first question also.

H. J. C., Milton, Pa.—Where can I find some work on the raising of rabbits, and how much will it cost? 2. Does the "Sportsman's Gazetteer" give it? 3. Where can I procure the game laws of this State, and what do they cost? Ans. 1. "Household Pets," price 75 cents. 2. No. 3. At this office may be obtained a copy of "Fur, Fin and Feather," containing the game laws of all the States and Canada; price 50 cents.

J. B. R., Philadelphia.—I am about purchasing a breech-loader of Nichols & Lefever, and before ordering would be pleased to have your opinion as to what would be the best gauge and proper weight of gun for me to order? Had thought of getting a 12-bore, 8-pound gun, but would be glad to have your opinion before purchasing? Ans. Such a gun would undoubtedly be of excellent service for general shooting, and would be our choice.

CITAS. A. WILLIS, Rockville, Conn.—An unabridged and illustrated copy of Webster's dictionary will cost \$12. Baird, Brewer and Ridgway's "Birds of North America" is the book you want; 3 vols., price \$10 per vol., or where illustrated in colors, \$15 and \$20, according to whether the heads alone are desired colored, or the complete bird. This is a grand work, and is complete in all details. The other books you mention are of little value.

A. S. F., Camden, N. J.—Your pups died from *pyemia*, induced from nursing the bitch in her diseased condition. Nellie demands tonic treatment and generous living. Give her Casswell, Hazard & Co.'s elixir of calasaya iron and strychnia in 20-drop doses three times a day, gradually increasing until she can take 60 drops—a teaspoonful. Also give her one-half grain of leptandrin, one grain of musk, and two grains of muriate of ammonia every three hours. Pay strict attention to cleanliness, etc. Your dog ought to die from the dosing she has received.

SUBSCRIBER, Phila.—Yesterday a clapper rail was shown the writer which had been picked up on the line of Penn. R. R. Its wings were broken and its flesh was considerably bruised. As it was found on the top of an embankment and above the level of the telegraph wires it was supposed to have been killed by flying against a locomotive headlight. Has anything of this kind come under your notice before? Ans. Such accidents are not at all uncommon. We frequently hear of grouse and quail and even turkeys being killed in this manner.

CONSTANT READER, Minneapolis, Minn.—1. What is your opinion of the Parker breech-loader? 2. Will a gun with laminated steel barrels shoot stronger or better than one of same make, bore, etc., with twist barrels? 3. Can the "Sportsman's Gazetteer" be bought in this city, or in St. Paul; if not what would the postage be to have it sent by mail? Ans. 1. We do not discriminate between makers. 2. The shooting does not vary any more than two guns of the same metal are liable to. The difference is in the wear. 3. Can procure at this office. Postage eighteen cents.

D. P. S., Glens Falls.—We suspect your dog is suffering from a disorder vulgarly known as surfeit mange. Give him no meat. If he refuses to eat anything else don't urge him, but remove his food at once, letting him starve until he will consider it a delicacy, not allowing him to mince or nose his food. Feed nothing but dry bread or a little oat meal, and that very sparingly. Give him a dose of calomel, say 5 grs., with 5 grs. of powdered ginger, and 5 of compound extract of colocynth and ¼ grain of podophyllin, followed by oil if it don't operate freely. Then give him half a grain of leptandrin and 3 grs. of bicarbonate of soda three times a day. Be particular as regards cleanliness, and add plenty of work and exercise. Light, almost starvation diet, is the principal thing for a few weeks, and feed but twice a day.

B. R. P., Assonet, Mass.—I have three very fine pointer pups five months old, and for the last five weeks they have been sick with the diarrhoea. I used Rochelle salts, then the prepared chalk. Two of them are O. K.; the other does not seem to gain. He eats well, but when anything passes him his bowel comes out about two inches and stays for hours. Will you be kind enough to tell me what to do for him? Ans. Give your puppies ¼ grain leptandrin and ¼ grain quinine three times a day. Also a teaspoonful of Boudault's wine of pepsin (Fougeras) morning and evening. Bland and nutritious diet is demanded, with particular attention to cleanliness. For the protracted bowel use suppositories of cocoa butter and iodoform ¼ grain to each suppository.

THEO. O., New York City.—Would you be kind enough to prescribe for my bitch pup? She is nearly three months old. I have been feeding her on bread and milk and very little meat, and have been giving her epsom salts. The eyes are very dull, and seem to be covered with a white substance; her coat looks rough and unkempt, no gloss at all; her tongue and lips look whitish; her body is very thin, hardly more than two inches across near hindquarters, but further up, near the forelegs, her belly seems to be bloated and hard; breathing a little labored; appetite variable. The kennel is situated in my back yard. She seems at times to suffer very much. Ans. Your kennel is too close to the stable for health. Give the puppy 3 grains of calomel, ¼ grain of leptandrin, ¼ grain of aloin, 2 grains of compound extract of colocynth, and 5 grains of powdered ginger at a dose. If it does not operate fully and thoroughly, give a good dose of castor oil. When it has operated give santonine eight grains, quinine, two grains; septandrin, two grains; aloin, one grain. Mix and divide with three powders. Give one three times a day every other day for three days (in milk doses), on the alternate day giving a dose of castor oil in the morning (three doses in all). After this give Boudault's wine of pepsin (Fougeras'), 5 teaspoonful morning and evening.

## A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR RECREATION OF MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[Post Office Box 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

## Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

\* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, SEPTEMBER 6, 1877.

## To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith, and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous contributions will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

Western Manager.

## CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, Sept. 7.—Trotting: Minneapolis, Minn.; St. Petersburg, Pa.; Quincy, Ill.; Mystic Park, Boston; Amelia, Ill.; Winchester, Va.; Davonport, Iowa. Base ball: St. Louis vs. Rhode Island, at Providence; Osceola vs. Volunteer, at Poughkeepsie; Quickstep vs. Amity, at Manhattanville; Wilkes vs. Press Nine, at Capitoline Ground; Defiance vs. McClung, at Philadelphia; Rochester vs. Allegheny, at Allegheny, Pa.; Rochester vs. Indianapolis, at Rochester. Boston Dog Show, at Music Hall.

Saturday, Sept. 8.—Trotting: Minneapolis, Minn. Running meeting at Newport, R. I. Base ball: Chicago vs. Boston, at Boston; St. Louis vs. Hartford, at Brooklyn; Louisville vs. Cincinnati, at Cincinnati; Monticello vs. Alpha, at Jersey City; Crystal vs. Winona, at Brooklyn; Lafayette vs. Atlanta, at Astoria, L. I.; Winona Clipper vs. Milwaukee, at Milwaukee; Athletic vs. Mutual of Norristown, at Philadelphia; Rochester vs. Allegheny, at Allegheny City. New York Athletic Club Games, at Mott Haven.

Monday, Sept. 10.—Trotting: Dubuque, Ia.; St. Joseph, Mo. Running meeting at Newport. Base ball: Rochester vs. Standard, at Wheeling, W. Va.; Browns vs. Louisville, at Terre Haute, Ind.; St. Louis vs. Resolute, at Elizabeth, N. J. Creedmoor: National Rifle Association.

Tuesday, Sept. 11.—Trotting: Edenburg, Pa.; Long Branch, N. J.; Fort Wayne, Ind.; Potstown, Pa.; Beacon Park, Boston; Albany, N. Y. Base ball: St. Louis vs. Hartford, at Brooklyn; Winona Clipper vs. Milwaukee, at Milwaukee; Rochester vs. Standard, at Wheeling, W. Va.; Browns vs. Louisville, at Terre Haute, Ind. Creedmoor: National Rifle Association. Union Regatta of the South Boston Yacht Club.

Wednesday, Sept. 12.—Trotting as above; also at Toronto. Creedmoor: National Rifle Association.

Thursday, Sept. 13.—Trotting as above. Base ball: St. Louis vs. Boston, at Boston; Chicago vs. Brooklyn, at Brooklyn. Creedmoor: National Rifle Association.

—One of the Metropolitan journals evidently has an eye to business, as it advertises for exchange "An Iron Clad Incubator, Artificial Mother Poultry Dentist's Lathe" for a kind, sound, family horse. Here is a chance for the man with the "Patent Extensible, Reversible Kamptulcon Hammock, Deck-Awning Carpet, with Watering pot attachment." We trust the opportunity to procure this lathe will not be allowed to escape by the dental profession.

—The St. Charles Hotel of Scranton, Pa., is the sportsmen's headquarters for northern Pennsylvania. Try it.

## STRAY NOTES FROM THE EDITOR.

REED CITY, MICH., Aug. 28, 1877.

SINCE my last communication to FOREST AND STREAM I have boated it through nearly all the interior lakes and water courses of Northern Michigan that are easily accessible by outside steamboat communication, or by the extraordinary interior facilities afforded by the Grand Rapids and Indiana Railroad, to which this section owes so much of its present development and prosperity. The writer here is more than surprised by the extent of the inland water communication. The country is filled with clear lakes, big and little, most of which are connected by natural channels, artificially improved. Through these little pleasure steamers constantly ply, affording the widest opportunity for visitors to enjoy the charming scenery, and fish in the limpid waters, which abound in black bass, trout, grayling, pike and muscalonge. I use the word "abound" in its broadest sense. I came here on purpose to investigate the sporting resources of this region, and can testify. Much of the wilderness is unbroken, and the fish and game are as tame and confiding as the tenants of Eden were before Adam bought his 10-bore breech-loader. Black bears pester the settlers. Deer cross the streams at their leisure, and stop to stare at us as we float by in our canoe. Pike jump at anything that glitters, right alongside of us; and the young mallards and wood ducks, which the law protects here until September, scarcely fly when disturbed.

Such vagabondizing as I am indulging in does not admit of frequent use of the mail service. Besides, one who is constantly on the move becomes demoralized for a correspondent. However, I have taken copious notes, and shall use them in due time. For the present what few scraps of information I can give out moments must necessarily be of a desultory character. Summarily speaking then, this is eminently a country for a sportsman, be he angler or gunner, be he hunting for profit or pleasure. Routes of access are numerous and made easy, and the hotel accommodations everywhere are the best I ever saw in a new country, and this is scarcely five years old. Five years ago there were but eleven houses on the lands granted to the Grand Rapids and Indiana Railroad comprised in a strip twenty miles wide by double that length. Now, possibly, there are 30,000 people. Villages are numerous all along the line, as I have already stated in another letter, and the soil and crops are such as to encourage new settlers to follow those who have gone before them. Fruit trees yield abundantly, and the forests are a lasting source of revenue and wealth. Brick takes precedence in construction, and what is done seems to be done with a view to durability and permanent establishment.

Just now grayling fishing is in its prime, and the more valued by anglers because the trout season closes on Sept. 1st. There seems to be a great abundance of grayling in the Manistee and Au Sable rivers, but excessive fishing is liable to deplete them as it has done other rivers in this section. To-day two gentlemen brought in a couple of hundred from the Manistee. The lot weighed about twenty pounds. Grayling do not run much above a quarter of a pound each, although they are sometimes taken weighing two pounds. We are to have a grayling supper to-night at the Morton House, whose table is reputed to be one of the finest in the United States. The other day no less than 2,000 (!) grayling were brought into the Bancroft House, an equally good, if not better, house, at East Saginaw, kept by Farnham Lyon, one of the proprietors of the Morton. They were caught in the Au Sable River, Aug. 22, by S. H. H. Clark, Gen'l. Supt.; E. P. Vining, Freight Agent; S. A. Kent, H. C. Nutt and son, all of Chicago, and W. N. Brainard, of Evanston, and indicate the character of that stream sufficiently to encourage anglers to fish it. A few days ago I had the pleasure of capturing some fine grayling in the Jordan River, which were once multitudinous in that stream, but are now few and far between. There are a few also in the Hersey branch of the Manistee, and a good basket can be obtained from it right on the line of the railroad, at Reed City. In the Pigeon, Sturgeon, Deer and Maple rivers are an abundance of grayling. In fact nearly all the streams that run north from the dividing ridge or water-shed that traverses the northern part of the State contain trout or grayling—sometimes both, though not often, but the streams that flow to the south do not. The entire fluvial geography of this region has been most accurately delineated in Mr. J. H. Page's pamphlet, entitled "The Summer Resorts of Michigan," printed in the interest of the Grand Rapids and Indiana R. R., and to be obtained from the company. This railroad traverses the whole peninsula from north to south, while the Flint & Pere Marquette Railroad bisects it east and west, both roads intersecting each other at Reed City. Travel on these routes is made very comfortable, and traffics run on fast time. The Woodruff sleeping coach of the Grand Rapids and Indiana road is the most comfortable and luxurious of all sleepers, as the beds are wider, the space above more ample, and the whole arrangement so contrived as to preclude any risk of one being shut off in his berth in case of accident and smothered or buried. Too much praise cannot be given to the pioneer landlords of this still un reclaimed and stump-dotted region. Their beds are generally good, and the food clean, fresh and well cooked. Here is a list of hotels which I can vouch for, and recommendation is given without fee or hope of reward. The Morton House and Sweet's, at Grand Rapids, (the first having a most enviable Western reputation); Cutler House, at Grand Haven; Bradley's Occidental

Hotel and the Cushman House, at Petoskey; Fountain City House at Charlevoix; Harsha House at Elk Rapids, kept by three young men (brothers), who deserve patronage and encouragement in continuance of well doing; the Lewis House, at Torch Lake, whose comforts are scattered all over the premises (cottages for families are attached to the premises); the Traverse City House, kept by the same proprietor, Frank Lewis; the Old Mission, Astor House, Lake View House, Island House at Mackinaw (the first and last named the most in request), the Bancroft at East Saginaw, and the Fraser House at Bay City. Many of these are very large and pretentious edifices, which make an Eastern man wonder to behold; others are surrounded by spacious grounds and pleasure attractions. Besides, there are Mrs. Webster's cottage on the Jordan, a solitary gem in the woods five miles up the river; Wrikel's Jordan River House, situated at its mouth, and the new pine-floored, but uncarpeted, cabin of citizen Francois Contois, on Mullet Lake, and Smith's Lodge on Indian River. Perhaps I shall take occasion to enumerate these in their order when I take the reader with me in company upon my round trip. This information is worth knowing. We suffered so much from niggardly or ignorant frontier landlords that it is a comfort to know that most of those in the Michigan wilds know how to keep a hotel.

Some of these will no doubt close for the season when the subsidiary inland little steamers are hauled off, as they will be soon; but the tourist or sportsman can go expeditiously almost anywhere with row-boats or sail-boats, and two of the very best months in the year still remain. Grayling, bass and pike may be caught until November 1, though trout are prohibited after September 1. Deer and bears are abundant all through the woods. As for ducks, the Indian River between Bush and Mullet Lake is in reality a water-course running through a swamp of wild rice, where mallards and teal congregate in vast numbers. If any sportsman has not yet traced out his map for the fall campaign, I know of no place which will more certainly yield him honorable spoils with so much comfort and so little expense. At Charlevoix are three good guides that we know (and possibly others nearly as good), who are available for the lake and river system that is included within an area of some forty miles around about. Their names are George and Mel Thompson and Ed. Aldrich. Services, with boat and provender, \$8.50 per day.

I find I have already spun a long yarn. It "grows upon what it feeds." Perhaps it is better not to give too much pork for a shilling.

I must not omit to mention that through all my travels I have been accompanied by A. B. Turner, Esq., the veteran editor of the Grand Rapids Eagle. His reputation as a trout fisherman is wide spread, and although the fish fear him, they love him. He can catch more fish with bait than any other man. Brother Turner was the only first-class fisherman left out when the twelve disciples were chosen. If he had been living at that time, the omission could not have been put down as an oversight. His luck would knock the spots clean off Peter's, who simply once caught a fish with a sixpence in its mouth, whereas Brother Turner often takes them with silver spoons in theirs. Such is his avidity for angling that he fishes to the very final close of the season, and yet so little content is he that he keeps a Fisher constantly on salary at his office, and induces this Fisher's wife to row him around in a skiff when fishing is out of the question, just to keep his hand in. He has a very fine rod, and he deserves it. HALLOCK.

## THE JOLLY CLUB.

IT is jolly, sensible and peculiar. We cannot learn that it claims to be either literary or artistic in its aims, yet we are confident that its membership renders the poet's thoughts better understood and the artist's conception more fully comprehended. Surely no one can be so stupid as to imagine that it is of a political character. Such societies do occasionally lapse into a certain very grim kind of humor, but who would ever think of calling them "jolly"? Least of all is the Jolly Club an association of hail fellows well met in an elegant club room to quaff nepenthe, and in the sweet reveries of the dream-compelling Havana sink into blissful oblivion of the outside world; for whatever may be our own private and reserved opinion, we should never have the temerity to incur the displeasure of our gentler readers by commending an institution whose benefits are exclusively enjoyed by the lords of creation. On the contrary, one of the strongest claims we can urge in favor of this club is that its benefits extend to all, man and woman, old and young.

The Jolly Club is a New England institution. The doughnut, the mince pie and Thanksgiving dinner are New England institutions. But the millions of doughnuts now annually consumed are confined to no State nor section; the mince pie is found wherever the flag floats, and the benign influences of Thanksgiving dinners are confined only by the parallels that bound the republic. It is with faith engendered by contemplating such triumphs of New England institutions that we hold up the Jolly Club as a bright and shining example to be known and imitated of all good people North, South, East and West throughout the land.

Putting out into Lake Champlain from the Vermont shore is a beautiful headland still covered with the primitive forest. Away to the North and East, its waves now laughing and rippling in the sunshine, now dashed to fury by the storm, stretches the expanse of water, dotted here and there by sail

and plunging steamer. Beyond are the woodlands, and away off in the East, looming up in the distance, are the Adirondacks, ever the same, yet ever changing in hue of gray and purple and blue. Clustered upon this woodland as if nestling for mutual protection in this great wilderness of oaks and pines, is a miniature village of rough and rustic, but comfortable cottages. Stumbling upon them in winter, you would find the doors barred and the snow crust unmarred by human footprint. But in mid-summer all is life, for this is the rendezvous of the Jolly Club. The cottages are occupied, hammocks swing invitingly from porch and tree; a fleet of yachts and boats is moored near the shore; the well worn croquet grounds are suggestive of hard fought battles, and the targets are well pierced by the bullet and the feathered arrow. But the attractions are without the camp. The leap of the bass in the lake and the flash of the trout in the stream offer abundant employment for rod and reel. The whirr of the woodcock invites the sportsman. There are heights to climb and dark ravines to be explored; new scenes to be discovered and familiar ones to be viewed at sunset and sunrise, sunlight and moonlight. Here a dashing rival in musical accents challenges to the discovery of its parent spring, bubbling up from beneath a mossy rock far up the mountain side. There is a tree, a glen, a mountain outline to be sketched, wild flowers to be gathered, questions of natural history to be investigated, and all the thousand and one subjects of study, sentiment and reflection which are known only to those who have communed with nature in her solitude, and as humble trustful neophytes been initiated into her mysteries.

So the summer passes, and with the falling leaves of autumn the cottage doors are once more barred, the little fleet disappears from the bay, the headland is left desolate and the Jolly Club disperse to their city homes, every man, woman and child of them, stronger in body and soul.

Long after, when the snows have descended upon the old point and the gales are howling through the leafless tree tops, in the distant city the flowers are taken from the press, and the sketch is filled in; while in and out with the pencil's play, run the memories of the golden summer days whose benediction is thus shed through the year.

And is not this better than the weary round of the fashionable "season?"

OFF FOR TEXAS.—On Monday the 27th August, Mr. J. H. Page, for so long a time, the masterly General Passenger Agent of the Grand Rapids and Indiana Railroad, bade adieu to many regretful friends at the depot in Grand Rapids, Michigan, and set out for Palestine, his future home in Texas. Henceforth he will fill a high and responsible official position on the International and Great Northern Railway of Texas. Those whom he has so valuably served at the north would scarcely have consented to the loss of his services had they permitted selfishness to enter into the consideration. The officials of the G. R. & I. R. R. are gratified to know that a wider field awaits his large capacities, and that his private endowments will be greatly increased. One special compliment was paid to him a fortnight ago at East Saginaw by the General Passenger and Ticket Agents' Association, of Michigan, of which H. C. Wentworth, Esq., of the Michigan Central Railroad, is President, when a splendid parting ovation was tendered to him by his admiring friends. Now that he has taken himself from among them, their grief is scarcely mollified by the fact that he has turned his steps toward that holy land of "Palestine" where the Lone Star gleams in its single and constant glory, and "thieves never break through and steal" if there is a squad of Rangers to stand guard.

Mr. Page is brother-in-law to H. O. Hughart, Esq., President of G. R. & I. R. Railroad.

A SPORTSMAN'S HOME.—The International Hotel at Niagara Falls fills the bill exactly. It is the only hotel at the Falls that possesses a passenger elevator, and also possesses large high rooms, properly ventilated, and the building is, moreover, fireproof. J. T. Fulton, a genial sportsman, a warm friend, and the prince of landlords, is the owner and proprietor.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,294.—[Advt.] ABBEY & IMBRIE, 38 Maiden Lane.

## AMERICAN TEAM REORGANIZATION.

Shall the American team be reorganized is just now the most talked of question among the long-range men. There is no doubt that there are shooters outside the chosen eight who possess abilities higher than many of those within the charmed circle. But the team men say that they are strong enough to win, and do not consider it fair that a man should be removed after he has borne the heat and dust of the battle of competitions through which his place was won. There is a little trades-union combination within the team to repel any application of the rule of the best man to the front. A glance at a few figures will enable us to point our meaning with fewer words. Since the team has been reorganized they have shot steadily, the reserve as well as the New Orleans men. Their score stood as follows:

| TEAM.              |          |          |          |          |                 |
|--------------------|----------|----------|----------|----------|-----------------|
|                    | Aug. 21. | Aug. 22. | Aug. 23. | Aug. 23. | Tot 4 days. Av. |
| Hyde.....          | 214      | 205      | 206      | 202      | 827 206 1/2     |
| Allen.....         | 219      | 196      | 207      | 201      | 823 205 3/4     |
| Weber.....         | 205      | 204      | 205      | 195      | 810 202 1/2     |
| Jewell.....        | 199      | 195      | 198      | 204      | 796 199         |
| Brucce.....        | 200      | 200      | 193      | 202      | 795 198 1/2     |
| Bydenburgh.....    | 206      | 178      | 207      | 201      | 792 188         |
| A. H. Jackson..... | 203      | 197      | 194      | 196      | 790 195 1/4     |
| T. S. Dakin.....   | 171      | 190      | 210      | 213      | 784 196         |

| RESERVE.      |     |     |     |     |             |
|---------------|-----|-----|-----|-----|-------------|
| Hepburn.....  | 202 | 201 | 202 | 200 | 805 201 1/2 |
| Lamb, Jr..... | 193 | 201 | 206 | 201 | 801 200 1/4 |

| NEW ORLEANS TEAM. |     |     |     |     |             |
|-------------------|-----|-----|-----|-----|-------------|
| Selph.....        | 201 | 206 | 212 | 210 | 829 207 1/4 |
| Arms.....         | 198 | 204 | 194 | 205 | 801 200 1/2 |

This would seem to point to a team of eight, comprising Selph, Hyde, Allen, Weber, Hepburn, Lamb, Arms and Jewell, which would be a strong team. There might be wise reasons against such a wholesale change about, but that a change would strengthen is beyond a doubt. Hepburn and Selph are safe and reliable for better scores than two at least on the team, and a change to that extent could work no harm; whether such a change is necessary is best judged by a glance at what the British team are doing at Creedmore. During the past week they fired on three days, each day improving on the preceding, until on Saturday last their first eight men reached a total passing the best which the selected American team have shown in joint practice.

| Wm. Rigby.....          | 190      | 199      | 198      | 587         |
| Totals.....             | 1556     | 1629     |          |             |

Sir H. Halford.....195 196 195 586  
W. H. Gilder.....184 191 188 563  
R. K. Greenhill.....186 183 183 552  
D. M. Fraser.....177 189 173 539

The bold fact is that the probable shooting eight of the foreign squad have shown a total better than any of the American team have yet been able to show. If this does not point to reorganization we know of no stronger argument. There is a committee of seven with President of the N. R. A., as its head, appointed on the International fall meeting, "with full power to make such arrangements in relation thereto as they shall consider necessary to make such matches a success," and even under the programme of selection for the team it is provided that "any person who may have been selected in accordance with the foregoing regulations may for cause be removed by a two-third vote of the members of the committee, team and reserve."

There seems to be no lack of authority for reorganization, but the matter rests after all with the team. If the team men choose to hang together and go down to a common defeat, they may also make up their common mind for a most uncommon volume of merited reprobation. Success, of course, covers a multitude of sins, and that alone will obliterate the foolhardiness of the present managers in not getting the best men wherever found.

To silence all doubt as to their ability to do all that could be expected of any team the Americans went to the firing point on Tuesday determined to put something noteworthy on record, and certainly the leading eight's total of 1654 points is little less than wonderful, not a single miss was recorded on the American scores, and but five outers in the 405 shots fired by the nine marksmen. The actually chosen team showed a total of 1641 points, and that too was ahead of anything we know of. To talk of reorganization after such a showing is almost like bettering perfection or of correcting infallibility. The men feel confident against any combination of national or imperial teams, and if they but pull together, regardless of who may lead or foot the list, we can also share their confidence as to results.

## GAME PROTECTION.

Philadelphia, Aug. 24, 1877.—On August 2 Robert Marshall, of Chester, Delancey County, Pa., was arrested at the instance of the Philadelphia Sportsman's Club, charged with capturing nine young partridges on the road near Rhodes' mill, early in last month, and had a hearing before Mayor Forwood. The principal witness for the prosecution was a colored woman, named Esther Brown, who testified that as she was on her way home from Bridgewater, she saw two young men, one of whom she identified as the defendant, who told her that they had in their possession nine young partridges, which they had caught, and that they intended to take the birds home to rear them. They asked her for something to put them in, and she gave them a tomato can for that purpose. She also stated that she had seen two of the birds in their possession. The Mayor imposed a fine of ten dollars and cost, which Marshall paid and was discharged.

On Sunday, the 19th, two other poachers of this city came to grief, being arrested at the instance of the same club for a violation of the game laws in shooting rail on Danby Creek out of season. The parties were taken before the Mayor, and had in their possession four rail and one blackbird. They were fined \$5 for each bird, and also \$5 each for a violation of the Sabbath. John Goff paid the fine, they leaving their guns in his possession as security.

We hope in a few days to be able to report several other cases for shooting rail out of season. The club have detectives employed to watch various marshes where shooting out of season is likely to occur. They have detected three or four more persons shooting out of season, and in a few days warrants will be issued for their arrest.

It is impossible to thoroughly police so vast an extent of

marsh as there is on the Delaware River, but a great deal has been done this season in connection with the West Jersey Game Protective Society. It is said that daily infractions of the law occur at Marcus Hook. As many as forty rail were boated in a single tide during the present week. There is also an ample field for the exercise of the vigilance of the Game Protective Association of West Jersey, on the flats, on Chester Island, and all along the Jersey shore, where game can be found any day, but particularly on Sunday. B. W. R.

OMAHA, July 28.—Below is the printed circular of Gen'l R. R. Livingston, President of the State Sportsmen's Association of Nebraska, respecting the game laws of the State. The law referred to was enacted last winter, and prohibits the killing of all kinds of birds except water fowls, jack snipes, sand pipers, waders and woodcocks at all times. By this you will see that Nebraska is not at this writing "the sportsmen's paradise." The legislature will again meet in one year from next January, at which time there is little doubt this unwise, not to say obnoxious, law will be repealed:

PLATSMOUTH, Neb., July, 1877.  
GENTLEMEN.—Understanding that an opinion seems prevalent among many members of Shooting Clubs, affiliated with the State Sportsmen's Association, that the present "Game Laws" are inoperative by reason of no repealing clause being attached, I beg leave very respectfully to call your attention to the fact that the last law enacted is binding on all good citizens until repealed or set aside by the decision of a court of competent jurisdiction.

As the members of the State Association only ask for a fair law that shall effectively protect game, it would be inconsistent with such desire to violate the existing law, because it is oppressive at present. I earnestly ask all gentlemen connected with clubs which have memberships in the State Association to abide by the law as it now stands, and to prosecute all violators of said law throughout the State; thus setting a commendable example of good citizenship, and carrying out the ideas of the legislators who framed the present Game Laws. This course will more certainly insure a proper law than setting the present one at defiance.

Sincerely trusting that all true sportsmen in this State will coincide with me in these views, I suggest that each local club immediately pass a standing resolution, which shall provide for the sure and swift prosecution and punishment of any member thereof, who violates the existing Game Law; and that a conviction before a proper tribunal shall operate as an expulsion of said member from the club to which he belonged.

Very respectfully, ROBT' R. LIVINGSTON,  
Pres't Neb. State Sportsmen's Ass'n.

VIVISECTION.—Mr. Huxley, in his address before the Domestic Congress in England, made a new and forcible plea on behalf of vivisection. He said he felt it to be his duty to express regret at a condition of law which permits a boy to troll for pike, or set lines with live frog bait for idle amusement, and, at the same time, lays the tracher of that boy open to the penalty of fine and imprisonment if he uses the same animal for the purpose of exhibiting one of the most beautiful and instructive of physiological spectacles—the circulation in the web of the foot.

Correct Professor! But the principle is much the same; one furnishes food for the body, the other for the mind.

NEW GAME CLUB.—Newark, N. J., has a game protection club, composed exclusively of Germans, which was organized July 17, 1877, under the name of Newarker Yagd Schutz Veren. Meetings are held every Thursday night at E. Goepferich Hall. Charles Eels, President; F. Lindenlaub, Vice-Pres.; John Tamval, Secretary; E. Goepferich, Treas.

"Lectures and Essays" is the title of a ghastly piece of rubbish, claimed to have been written by an M. D., it being written in the interest of a Patent Food Company.

## The Rifle.

### THE INTERNATIONAL TEAMS.

The rival long-range teams are working with vigor and energy in drill and preparation for the great International match on Tuesday, the 28th inst. The Englishmen took their first day's work on the range, and did very fairly indeed, the scores standing as follows. A. P. Humphrey retired with a broken mainspring in his rifle:

any note or pretence, and I cannot, therefore, conceive why you should presume to say to America that that protest does not express the opinion of the Scottish rifle shots, while your desire that they should assume in its place your simple *ipse dixit* to the contrary is quite absurd. It might be unnecessary to say more.

The protest is explicit and bears that unless the rights of Scotland to compete hereafter are to be thereby prejudiced, the council have no objections whatever to a British team competing, but, on the contrary, would be glad to learn of their success. They have since disclaimed any intention to cast the

slightest imputation or insinuation against the National Rifle Association or its council. But the same parties are promoting the British team this year who last year maintained that Scotland was not invited, and had no right to compete; who, though assured by America, that national teams, and not a mixed British team, were intended, that Scotland had been invited and had accepted, and that the British Association (the governing body of the council) did all in their power, both by cable and letter, to get Scotland excluded from the match; who, notwithstanding the rules having been so interpreted and acted upon, are still this year, contrary thereto, endeavoring to foist a British team in place of national teams into the match, and who, if successful, will have the entire control of the match next year, in inviting teams and otherwise. Any impartial person knowing this will be able to judge whether our council had reason to fear that

Scotland has fought once, and intends to fight again, and, if necessary, again, till they win; and the council simply do not wish it to be implied that they are acquiescing in a change of the rules which would prevent Scotland competing hereafter. Besides, although a British team were successful, and although Scotland did not protest, any nation in the world might lodge a protest against their obtaining the trophy as having no right to compete under the rules. Far better were a purely English team to compete, about which there could be no question, and a sufficient number of English shots have gone out to permit their doing so. Considering the canons which led to the formation of the club and your obstructive correspondence thereafter with the former secretary, I regret you should think so lightly of the honor which would be done to you and to your country by your being your patron, but you have left me no alternative, and I have, therefore, as desired, deleted your name from the roll. I am, dear sir, yours truly,

H. RENTON, Honorable Secretary.

HOBATIO ROSE, Esq., Ben Wyvis Lodge, Evanton, Ross-shire.

*Walnut Hill Range.*—The fifth competition for Sharps long range rifle took place at Walnut Hill range on the 28th inst. Messrs. Rabbeth, Lowell, Kirkwood and Souther had each led once at the previous contests for this prize. Mr. N. W. Arnold won in this, obtaining 43 out of a possible 50. The distance was 200 yards, and ten rounds for each. The following is the record.

[illegible]

The fourth competition for the Sharps mid-range rifle also resulted in the success of Mr. Arnold, who scored 60 out of possible 75. In the previous contests for this rifle Messrs. Arnold, Osborn and Farrar had each been successful once, and now Mr. Arnold has to win once more to take it. The distance was 200, 300 and 500 yards, five rounds at each distance. The score was as follows :

|                  |    |    |    |                  |    |    |    |
|------------------|----|----|----|------------------|----|----|----|
| N W Arnold...23  | 19 | 29 | 69 | J B Osborn....21 | 10 | 13 | 54 |
| H T Rockwell..21 | 17 | 21 | 59 | S E King.....20  | 15 | 13 | 52 |
| L W Farrar....21 | 18 | 18 | 57 |                  |    |    |    |

On the 29th inst., the first special competition for places on the Inter-State team of the Massachusetts Rifle Association took place at Walnut Hill. The weather was excellent for shooting, as the scores made sufficiently indicate. Seven gentlemen entered the competition, but two were forced to withdraw before they completed their scores on account of their rifles getting out of order. Mr. Wenys, who usually shoots well, fairly outdid himself, making the noble score of 216 out of a possible 225, a feat never before accomplished in the State. The full score of each competitor is appended:

On Saturday last the long-range men of the Mass. Rifle Association were again out in competition for places on the State team at the Inter-State match in the Creedmoor falls.

The shooting of Messrs. Wemyss and Clark was exceptionally good. Mr. Wilder put in a fine score at 800 yards, but fell off at the longer distances, and Mr. Gerrish had several "unaccountable" misses which marred his record. The scores of those who fired the full number of rounds stood as follows:

|                               |                            |

The Utica Citizens' Corps held their annual rifle match at

—The Utica Citizens Corps held their annual rifle match at Alexandria Bay, Aug. 22d. Remington military rifle; 200 yards off-hand; no sighting shots; 47 contestants. Prizes were won as follows:

|                               |   |   |   |   |      |
|-------------------------------|---|---|---|---|------|
| Private J. Forbie Miller..... | 5 | 2 | 3 | 5 | 5-20 |
| " Romain C. Cole.....         | 5 | 5 | 5 | 0 | 2-17 |
| Sergeant Erbert Bagg, Jr..... | 3 | 3 | 4 | 3 | 2-16 |

Baltimore, September 1.—The fourth monthly contest came off this afternoon at the Patapsco Rifle Range. The contest

was at 200 yards, off-hand military ride, eleven entries. Mr. B. B. Lynch was the successful competitor, by a score of 27. Then followed the third contest for the Whitney forty-five

calibre rifle, which was won by Mr. F. H. Hack, who scored an aggregate of 83 out of a possible 105.

**Worcester, Mass.**—The Rifle Team of the Worcester Sportsmen's Club did some very creditable work at the Greenwood Range, Sept. 1, in shooting at 800 yards, for places on the team which is to compete with the team from the Lawrence Club. The most remarkable score was by Mr. C. B. Holden, who made 23 consecutive bulls' eyes. Maj. L. G. White also had a splendid run of 20 consecutive bulls' eyes. The detailed result was as follows:

|                   |     |                  |     |

—Sir Henry Halford and eight of the British riflemen were guests of Judge Gildersleeve and the West Side Gun Club, in Elm Park, Aug. 31st. They tried their skill at shooting glass balls from Bogardus traps, eighteen yards rise, and about forty yards from the firing point. Then Milner and Sir Henry shot a match against Judge Gildersleeve and E. Schweyer, the President of the West Side Gun Club. Out of 10 balls Milner broke 8, Sir Henry Halford 7, Judge Gildersleeve 6 and Schweyer 4. In another match of 6 balls, Judge Gildersleeve broke 6, Milner 2, Sir Henry 2, Frazer 1, Col. Bodine 5 and Schweyer 8.

Twenty-six members of the Gun Club shot for a gold badge which was in the possession of the President, Mr. Schweyer. He had won it twice, but was required to win it again as a condition to permanent possession. This time Luigi Brizzolari won it, making 16 shots out of a possible 20. Schweyer made 15 shots.

## THE AMERICAN-CANADIAN MATCH. AMERICA VICTORIOUS.

[SPECIAL DISPATCH TO THE FOREST AND STREAM.]

**CANADA—Toronto, Sept. 3d.**—The trip to this city of the team representing the Amateur Rifle Club of New York, has been entirely successful so far as the visitors were concerned, but for the hosts it was rather a surprise to find themselves for the third time at the foot of the list; we have about come to the conclusion that there is no such word as fail known to the American rifle shooters.

The Amateur Rifle Club men arrived here Friday evening after a safe trip, two of the members only feeling a slight indisposition after their long journey by rail. The men with their baggage, rifles, ammunition, etc., were received at the Rossin Hotel, where most comfortable quarters had been assigned them. Saturday they paid their first visit to the ranges of the Ontario Rifle Association, about three miles from their hotel, on the Garrison Common. Sweeping about the range on three sides lie the waters of the lake, and a liberal amount of breeze is always sure to greet the rifleman at his practice here. The American gentlemen discovered that as the matches were in progress their only chance of getting a pop over the ground was to join and take part in the matches. This they did, and found that in shooting from the mounds used as firing points, to carry the bullets clear of the fences a radical difference in elevations from those governing at Creedmoor was necessary; not only were the elevations higher, but a greater distance on the vernier was required between 800 and 900 and between 900 and 1,000 yards than was customary at Creedmoor. The men, however, soon grasped these variations, and among the long-range winners were Keene, Farrow, Hepburn, Geiger and Rathbone, of the American party. It had been thought best, with a view of strengthening the chances for an American victory, to limit the match to six men on either side. This privilege of choice between six and eight contestants was given the commander of the visiting team, and Lieutenant-Colonel E. H. Sanford, the President of the Amateur Club and the captain of the team, had decided on six and named as the American team; W. M. Farrow, L. Geiger, W. Gunn, R. Rathbone, H. Fulton and L. L. Hepburn. R. H. Keene, J. P. Waters and Colonel Sanford looked after the interests of the team generally.

The Canadian members of the Victoria Rifle Club, of Hamilton, have been practising with great care in anticipation of the match, and the purchase of American breech-loaders was with the idea of placing themselves more on an equality with the visitor, over whom they expected to achieve an easy victory, as the best of the long-range members of the Amateur Club were already pre-engaged in practice for the International match with the British team at Creedmoor.

This morning the match opened at 10:30 o'clock with a fair day, but with an ugly wind blowing from the northwest from the 12 to 3 o'clock quarters, requiring an allowance of from seven to ten points for a right wind, as a consequence the average score made is not at all an extraordinary one, the best on the field by L. L. Hepburn, only reaching 199 in the possible 225. The Amateurs led from the first distance, reaching a lead of nine points at the close of the 800 yards score; at the 900 yards finish the score stood two in favor of the Americans, but the great falling off at 1,000 yards left the Amateur Club men far ahead. Their system, a careful system of mutual coaching, had saved the day to them, despite Rathbone's illness, while the Canadians notwithstanding the fact that three of the members used American rifles, were beaten, as much by their independent style of work as by any other cause. At the finish Major Gibson and Capt. J. J. Mason, of the Canadian team made short speeches to the crowd, informing them of the defeat of their men, and in response Col. E. H. Sanford thanked his hosts on behalf of himself and team for the pleasant time they had enjoyed. With cheers the match then concluded. The scores stood as follows:

| THE AMATEUR CLUB TEAM.           |          |          |           |        |

**"A COOL CAVALRY TROOP."**—The Syracuse Journal talks as follows, without first informing it that a fine bronze trophy was the trophy for the Yates men when they capture the first cavalry prize at Creedmoor:

We fear it is nearly settled that the Yates Dragoons will not go to Creedmoor this year. Year after year they have won "water coolers," hoping that eventually the stock would be closed out, and something else offered. It is expensive for the Dragoons to enter the contest, and would cost them something to build more storage room for water coolers as they are to continue the capturing of them.

**MASSACHUSETTS—Springfield.**—Several of the Springfield Army employees enjoyed a shoot the other day. Three strings of ten shots each were fired at 825 yards, the size of targets and mode of marking being the same as at Creedmoor, L. L., with a possible 150 for the whole. Two of the guns were the Springfield rifle, precisely the arm issued to the army, and the very gun which a Boston paper recently said "nobody could hit a barn door with at a distance of 300 yards;" the others were the "officers' model," which differ only in having a little shorter barrel and the peep-hole sight permitted at Creedmoor for long-range shooting. The regular army ammunition was also used; and, considering that two of the men had never before fired at long range, the results were very good, as will be seen:

|                  |    |    |    |     |                     |    |    |    |    |

**THE IRISH-AMERICAN RIFLE CLUB.**—The New York Irish-American Riflemen have "gone and done it" for the Connecticut Irish-American riflemen, taking a trip up to Greenwich on the 29th ult. The New Yorkers, were well received, escorted to the range, where, at the one target in use, the two teams peppered away neither of them particularly satisfied with their own record, but the visitors carrying off the honors and the silver mug. The New York men were somewhat bothered in the fact that the shooting point was higher than the target, and the down-hill aiming was somewhat of an inconvenient novelty. The shooting was at 200 yards, any rifle. The scores in full, standing:

Gen. F. F. Millen was Captain of the New York team, Lieut. Kneeland being his adjutant.

It is intended to have a return match at Creedmoor within a few days, when the Down-Easters will receive another lesson in how to do it.

On Saturday last, the Irish-American Rifle Club of New York held its regular weekly competition for the Millen trophy, the scores standing:

|                      | 200 | 500 | Tl. |                      | 200 | 500 | Tl. |

| M. M. Malby.....     | 26  | 23  | 49  | Sergeant McHugh..... | 29  | 17  | 46  |

**NEW YORK—Rochester.**—The 7th Division, N. G. S. N. Y. annual prize meeting on the Rochester ranges was well carried through by Col. C. P. Bromley, ex-officer, and in some of the matches good shooting was shown. The meeting extended over the 27th and 28th ult., and among the competitions were the matches for the Lansing Medal, open to all members of the seventh division, N. G. Distance, 200 yards; rounds, seven.

Prize—Gold badge, to be competed for at each regular meeting, and held by the winner one year. Value \$25. Donated by Brigadier-general J. H. Lansing.

James Ratt, 27; Lieutenant J. F. Boyd, 62; Col. F. A. Schoffel, 26; Dr. Buckley, 26; Adj. A. H. Bruman, 26; Sergeant Manville, 23; Colonel Bromley, 23; G. B. Parkhurst, 21; Jacob Rapp, 21; Colonel S. S. Eddy, 21; Lieut. Peter Hess, 20; Capt. B. F. Ridley, 21.

The Bruker Medal Match.—Distance, 200 yards; position, standing; any rifle within the rule of the National rifle association; seven shots, with two sighting shots additional. The medal to become the property of the person who wins it three times, and to be shot for on the first Friday of each month.

Dr. Rider, 31; R. B. Yates, 30; Dr. C. Buckley, 29; Col. F. A. Schoffel, 27; E. Angevine, 27; Colonel S. S. Eddy, 29; Captain E. S. Phelps, 21; Colonel Bromley, 20; General W. H. Briggs, 16; C. Bradley, 17. Capt. Moore, of the 54th Regiment, took a revolver, value \$35, presented by E. Remington & Sons, in a match open to all commissioned officers of the seventh division N. G. Distance, 200 yards; rounds, five; position, standing. General Brinker, 16; Captain Hessinger, 15; Lieut.-Col. Eddy, 16; Colonel Begy, 7; Lieutenant Boyd, 16; Colonel Campbell, 14; Lieutenant Swartz, 15; Major Weitzel, 5; Captain Ridley, 6; Lieutenant Myer, 15; Captain Wagner, 13; Captain Browne, 9; Captain Heilbron, 13; Colonel Bromley, 13; Lieut. Strandenmaier, 12; Captain C. C. Meyer, 10; Capt. Moore, 20; Lieutenant Hess, 15; Lieutenant Elkhardt, 20; Adjutant Bruman, 14; Lieutenant Stallman, 18; Major Fleckenstein, 8.

**Rahway, N. J.**—First competition for badge presented by the Rahway Rifle and Sporting Club, took place on this range at Rahway, N. J., on Sept. 3d. The badge was won by Mr. B. A. Vail, President of the Club, on a score of 43. The next competition will take place upon this same range, on the 27th of September, commencing at 2 p. m., open to all comers; two sighting, and ten scoring shots. Entrance fee, 50 cents.

**RIFLE PRACTICE.**—When Messrs. Dennison & Co. got up their popular targets for rifle practice, they "hit the nail on the head," as they have succeeded in rendering them perfectly accurate in every particular, and amateur sportsmen owe them a debt of gratitude for giving them something so entirely reliable, and at so low a price. When they offer to send by mail a specimen one-hundred-yard target, together with circular containing "Major Henry Fulton's Rules for Private Practice," for the small sum of ten cents, it shows they are quite willing to have these goods thoroughly tested before they are purchased. Their advertisement, in another column, should be read for more particulars.—[Adv.]

**ORANGE JUDG'S EXPERIENCES.**—In a note to the chairman of the executive committee of the Connecticut Rifle Association, Mr. Orange Judd says: "As the shells, after repeated firing, become too much expanded to enter the barrel easily, many have expressed a wish to have some contrivance to shrink them. I procured a steel tube for this purpose and drove the shells into it with a wooden mallet, removing the shell with a wooden pin inserted in the opposite end. It appeared to work well and I had no difficulty in inserting the loaded shells in the gun. But now for the result. You doubtless noticed the unaccountable misses in my shooting on Saturday, 'goose eggs' following right after bull's eyes, three of them at the 900 yard range alone, and other shots dropping to the bottom of the target. On coming home and cleaning the shell I found the truth. Two-thirds of all those doctored or contracted shells burst in firing just where they had been most contracted. My son George used a few similarly prepared shells which also dropped the bullets. So, according to this experience, it will not do to reduce the diameter of the shells at the base after they have once expanded.

—The members of the British and Crescent City rifle teams have been elected honorary members of the Manhattan Club.

## Game Bag and Gun.

### GAME IN SEASON FOR SEPTEMBER.

|  |  |
|--|--|
| Moose, <i>Alces machilis</i> .                                 | Black-bellied plover, or ox-eye, <i>Squatarola helvetica</i> . |
| Caribou, <i>Alces canadensis</i> .                             | Ring plover, <i>Egialitis semipalmata</i> .                    |
| Elk or wapiti, <i>Cervus canadensis</i> .                      | Stilt, or long-shanks, <i>Himantopus nigricollis</i> .         |
| Red or yellow deer, <i>O. virginianus</i> .                    | Woodcock, <i>Philohela minor</i> .                             |
| Squirrels, red, black and gray.                                | Red-breasted snipe or dowitcher, <i>Marechamphus griseus</i> . |
| Hares, brown and gray.   | Red-backed sandpiper, or ox-bird, <i>Tringa americana</i> .    |
| Reed or rice bird, <i>Dotychomyz oryzivorus</i> .              | Great marbled godwit or marlin, <i>Limosa fedoa</i> .          |
| Plumated grouse or prairie chicken, <i>Cynopterus cupido</i> . | Willow, <i>Totanus semipalmatus</i> .                          |
| Ruffed grouse or pheasant, <i>Bonasa umbellus</i> .            | Tattler, <i>Totanus melanoleucus</i> .                         |
| Quail or partridge, <i>Ortyx virginianus</i> .                 | Yellow-shanks, <i>Totanus flavipes</i> .                       |

"Bay birds" generally, including various species of plover, sandpiper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limcolae* or Shore birds.

The frequent alteration of game laws makes such confusion that sportsmen are kept quite in the dark as to when shooting on various kinds of game is permitted. We therefore append the following table for reference:

| States    | Pinnated Grouse. | Ruffed Grouse.  | Quail.          | Woodcock.        |
|-----------|------------------|-----------------|-----------------|------------------|
| Ill.....  | Sept 1 to Jan 15 | Oct 1 to Feb 1  | Oct 1 to Feb 1  | Sept 1 to Jan 15 |
| Ind.....  | Oct 1 to Feb 1   | Nov 1 to Jan 1  | Nov 1 to Jan 1  | July 1 to Jan 1  |
| Iowa..... | Aug 15 to Dec 1  | Sept 1 to Dec 1 | Oct 1 to Jan 1  | July 1 to Jan 1  |
| Minn..... | Aug 14 to Oct 1  | Sept 1 to Dec 1 | Sept 1 to Dec 1 | July 3 to Nov 1  |
| Wis.....  | Aug 15 to Nov 1  | Sept 1 to Jan 1 | Sept 1 to Jan 1 | July 4 to Nov 15 |
| Neb.....  | No Shooting      | No Shooting     | No Shooting     | No Restrictions  |
| Kans..... | Aug 1 to Feb 1   | No Shooting     | Oct 1 to Jan 1  | No Restrictions  |

Correspondents and subscribers will oblige us and serve the cause by sending four-line reports of the shooting in their respective localities.

**MASSACHUSETTS—Salem, Sept. 3d.**—The past week has been giving us some fair shooting at Eagle Hill, Ipswich Neck, Essex, Plum Island, and vicinity. Peeps were thick last Saturday as well as gunners at Eagle Hill. Among the birds shot have been jack curlew, dough dove, a good many uplands, winters, grass birds, etc., also black-breasts and snipe, with some beebe-heads. Saw a large flock of foul flying high over Ipswich last Saturday. I think they were brant. I think some birds may be picked up most any day at Eagle Hill now and for the next month or so.

**NEW JERSEY—Basking Ridge Sept. 1.**—A hunting party has been organized for sport in Pike Co., Pa.

**PENNSYLVANIA—Uniontown, Aug. 30.**—The most exciting fox chase of the season came off in the neighborhood of old Centre Furnace, in the mountains, last Tuesday week. "Wish" Miller, the irrepressible sportsman, accompanied by his son, Grant, and Dr. W. B. Fuller, with Wish's celebrated trained kennel of noble mastiffs, started early for the place, and by nine o'clock had surprised a gray fox, which gave chase for three hours before being captured. A second one was soon unkenneled, and this one, as "Wish" deftly characterized it, was undoubtedly the swiftest and most cunning fellow this side of the mountains. It made an excellent chase several hours, but finally took refuge up a tree. After some delay however, they succeeded in starting it again, and for a time

it led Ringwood and Slide at a lively rate, but gradually lost ground and slid under the rocks where it was left in apparent security, and one of the most exciting chases of the season was declared off.

FLORIDA—*St. Augustine, Aug. 31.*—Dr. Folsom, Dr. Phillips, and others, will soon leave for the south, where they go to hunt, fish, etc. They will carry good dogs, and everything possible to thoroughly equip a hunting party. They are crack sportsmen, therefore there is no doubt of their success.

Dayton.—Since the ordinance was passed by the town council, "prohibiting shooting along the shores and in the town," the cranes and other water birds are becoming more numerous and very tame, in some cases walking into yards without fear.

Indian River.—Quail, and game birds of all kinds, will be numerous the coming winter, from the large numbers now seen. Deer, bear, turkey, squirrels, etc., promise fine sport. Northern sportsmen should bring good guns.

ARKANSAS.—Prairie chickens are scarce this year.

MISSOURI—*Kansas City, Aug. 31.*—A hunting party, consisting of Gen. Treadway, Col. Cheever, Maj. Burke and Capt. Louis, who left here a few days ago, have just returned from Southern Kansas, where they report excellent sport.

INDIANA—*Indianapolis.*—The members of the Gun Club are to have another tournament in the fall, at which rabbits are to be employed instead of pigeons. The quadruped is to be bumped out of his trap, and started off at a good pace before shooting is allowed.

WISCONSIN—*Westboro Section, Aug. 27.*—West of here is the best deer country in the State, and no one in the region who hunts them. Ruffed grouse are abundant here, and a few wild pigeons are seen. Four bears have been killed in this neighborhood this summer. The Wisconsin R. R. Section man here saw one a few nights since, and Duncan & Taylor's night watchman drove one away from the mill a few nights later. A. S. Russell of this place is a good woodman and would take parties out if desired. S. D. C.

[This excellent game region is reached by Wisconsin Central R. R., and is almost unknown to sportsmen.—Ed.]

Pomeroy, Iowa, Aug. 24.—The opening day of the game season dawned cool and cloudless, making just the day for the initiation of dog and man into the pleasures of grouse hunting, though if I am to judge from sundry suspicious appearances some of the law-abiding citizens (?) did not wait for the time prescribed by law, solacing their wounded consciences—if anything of that sort finds a place in their vile anatomies—by saying they were killing a peculiar kind of "short billed snipe."

Birds are abundant, of fine size, and in good order. Bags of thirty to fifty are often reported for one gun. Ducks are beginning to make their presence known, visiting the fields in the morning and evening, and will soon afford fine sport. Young geese are commencing to sail around the fields. From their early appearance it is predicted that they will be unusually plentiful this season. The first English snipe of the season were found on the evening of the 21st inst.—three fine plump fellows. They will be numerous as soon as the fall rains commence. Deer are reported plenty eight to ten miles out, and are easily taken with shot gun of heavy caliber loaded with buckshot. ABE DACOTAH.

OREGON—*Eugene City, Aug. 20.*—Mountain and ruffed grouse, quail and pigeons are abundant now. Our wing shots make bags of from half a dozen to two dozen in half a day or less. I shot, last evening, five mountain grouse, four ruffed grouse, five quail and a brace of young mallards. The ruffed grouse were killed in crab-apple thickets, the rest in stubble fields. Acorns are abundant this year, so we are certain of excellent mallard and wood duck shooting this fall. J. G. S.

MONTREAL, Sept. 1st.—Mr. N. P. Leach killed a fine bag of game to-day at the Back River, within ten miles of the city. It comprised woodcock, ruffed grouse, black duck, snipe and quail.

FIRST SNIPER.—The first snipe exhibited this season was brought to this office on Monday last. It was killed by Mr. Justus von Lengerke, on the Hackensack Meadows, September 1st, over his lemon and white setter Dash. It was a plump, well conditioned bird, evidently the harbinger of fat long-bills.

CHAMPION GLASS BALL TRAP.—Messrs. Barton & Co., of 337 Broadway, have placed in the market a new glass ball trap, which claims to be the *ne plus ultra*. It combines compactness with durability, and is arranged, by a swivel on the bed-plate, to throw a ball in any direction or at any elevation unknown to the shooter, a screen preventing his seeing the direction in which the trap is set.—[See adv.]

## PIGEON MATCHES.

Squan, Sep. 1.—Match between New York and Philadelphia shooters. The conditions were H and T traps, 10 birds, 27 yards rise, 80 yards boundary; 1½ ounce shot and Long Island Club rules. Summary:

| NEW YORK.                      |    | PHILADELPHIA.             |    |

TEXAS—*Waco, Aug. 24.*—To-day the Waco Gun Club shot the first match for a fine gold headed cane, presented to the club by Schmidt & Sarg, jewelry dealers, of Waco. The conditions: 10 pair of glass balls, Bogardus traps, 18 yards rise; the cane to be shot for six consecutive Fridays, the member winning it the most times to become the owner.

| Layman.....   | 10 | Scott.....  | 10 |
| Thompson..... | 6  | Davis.....  | 10 |
| Wilcox.....   | 9  | Wilson..... | 9  |

The tie was won by Davis; Wilcox and Morgan divided second, Ryan third, Thompson fourth.

Fifth match, \$3 entrance, 5 single balls.

|             |   |             |   |
|-------------|---|-------------|---|
| Wilcox..... | 5 | Morgan..... | 5 |
| Scott.....  | 4 | Layman..... | 4 |
| Lewis.....  | 4 | Derby.....  | 4 |
| Ryan.....   | 3 | Graham..... | 3 |
| Wilson..... | 3 |             |   |

Wilcox and Morgan divided first, Lewis and Derby second; Layman and Graham, after shooting off, divided third.

Sixth match, \$5 entrance, 5 single birds.

|               |   |             |   |
|---------------|---|-------------|---|
| Wilcox.....   | 4 | Davis.....  | 3 |
| Graham.....   | 3 | Lewis.....  | 3 |
| Ryan.....     | 2 | Wilson..... | 2 |
| Morgan.....   | 2 | Scott.....  | 5 |
| Thompson..... | 4 | Derby.....  | 3 |

Morgan and Scott divided first, Wilcox and Layman second, Derby won third.

To persons seeking healthful recreation and enjoyment, without being subjected to the usual annoyances of "fashionable" sea-side resorts, the Franklin House, Plymouth, Mass., affords unusual opportunities, having unusual facilities for harbor, river or surf bathing, while splendid opportunities for boating in either smooth or rough water may be enjoyed at choice. Cooling breezes, comfortable rooms, a well supplied table, and a reasonable scale of prices are all to be found here.

METROPOLITAN AMATEUR ROWING ASSOCIATION.—This Association held its second meeting at the Fifth Avenue Hotel last Thursday evening. It was decided to hold the first regatta on the Bergen Point one half mile course. The day appointed is October 17.

MASSACHUSETTS—*Boston, Aug. 29.*—The city regatta appointed for July 4 and postponed because of the unfavorable weather, was successfully sailed to-day under very favorable circumstances. The races: For sloops and schooners measuring 35 feet and upward on the water line, first prize for each class, \$75; second, for each class, \$40. For centre-board and keel sloops, and for schooners measuring 25 feet and less than 35 feet, prizes as follows: For centre-board sloops, first prize, \$60; second, \$30. For keel sloops, first, \$60; second, \$30. For schooners, first, \$60; second, \$30. Third race.—For centre-board and keel boats measuring 20 feet and less than 25 feet, prizes of \$50, \$30 and \$20 for each of the two classes. Fourth race.—For keel boats measuring 15 feet and less than 20 feet, prize of \$15. The first prize in the class last specified was awarded on the 4th of July. The courses were: For first class, 20 miles; for second class, 14 miles; for third class, 8 miles; for fourth class, 3½ miles. Summary:

Boston, Aug. 30.—In the Lakeman and West End Boat Club regatta at Silver Lake, Aug. 29, the running match of 100 yards was won by D. Dwyer in twelve seconds; the swimming match was won by J. Regan. In the four-oared working boat race of three miles for prizes of \$80, \$30 and \$20, the Leveet crew crossed the line in 19m. 31s; the Lynn in 19m. 41s; and the City Point in 19m. 25s. The referee, however, decided that the line was not crossed in the right place, and the race was accordingly pulled over again this afternoon on the Charles River. The South Boston crew won in 21m. 57s. The single-scutt shell race of three miles was rowed yesterday by Lynch in 20m. 58s.; Mossmer, 21m. 4s.; Kelly, 21m. 38s.; Ross, 21m. 41s., and others. A squall prevented the rowing of the single-scutt working boat race, which came off this afternoon. Distance, one mile and return. Prize of \$50 won by S. Gookin in 15m. 50s.; second prize of \$25 won by C. Steele; third prize of \$15 won by G. Crosby.

Lowell, Aug. 30.—A two-mile veeper boat race to-night was won by Fred Tickney in sixteen minutes and twenty-two seconds. Lee was second and Cushing third.

Martha's Vineyard, Aug. 29.—Annual whale boat race, three miles with a turn. Two rafts from New Bedford, one from Edgarton and one from Oak Bluffs. The Oak Bluffs won first prize, \$70, in 24m. 50s.; New Bedford, sixth ward, second prize, \$50, in 27m. 55s.; sixth ward, junior, third prize, \$10, in 30m. 10s.

Newport, R. I.—Handicap race for silver prize presented by Com. Louis L. Lorillard, of New York. The course was about twelve miles:

|              | Start.            | Finish.  | Actual Time. |
|--------------|-------------------|----------|--------------|
| Eleanor..... | H. M. S. H. M. S. | 11 00 00 | 1 04 00      |

THE NEWBURG REGATTA.—The first annual regatta of the Newburg Rowing Association took place on the Hudson River, Aug. 30 and 31, and Sept. 1. The programme was very interesting and, notwithstanding the somewhat unfavorable condition of the course, the events were generally successful. The following is the summary of the races:

Single-scutt race for boys under twenty years of age; working boats; distance, three miles. First prize, F E Ten Eyck, of Peekskill; time, 26m 30s. Al Darrah, of Newburg, second.

Single-scutt shell race; same distance; open to all amateurs. Entries: Thomas Fearon, Vesper Rowing Club, Yonkers; Frank W Tompkins, Wovenhook Club, Greenburgh, N. Y.; E Mills, Jr., Athletic Club, N. Y. City; George W Lee, Triton Club, Newark, N. J.; Frank Edgerton, Jr., Saugerties Club, Saugerties, N. Y. Won by Lee in 23m 15s; Fearon second, three lengths behind.

Single-scutt shell race for professionals; same distance. Entries: John McKie, Cresskill, N. J.; George Rankin, Hoston, Mass.; John Bigin, New York City; Michael Burns, Buffalo, N. Y.; George H Hooper, Boston, Mass.; F A Johnston, Boston, Mass.; James A Ten Eyck, Peekskill, N. Y. The competitors crossed the line in the following order: Johnston, 23m; Ten Eyck, 23m 43s; Hooper, 24m; McKie, 24m 30s; Rankin, 24m 45s; Burns, not timed.

The last race of the first day was a free to all race in double-scutt working boats, not over 19ft long and under 150 lbs. weight. The entries were: A Darrah and A McGinnis, of New York City; F A Ten Eyck and T E Ten Eyck, of Peekskill; Dan Ward and Ellis Ward, of Corvau, and John Bigin and J Hickey, of New York City. Won by Darrah and McGinnis in 22m 45s. Owing to the rough water Friday but one race and one double-scutt working boat race were rowed on the second day, 30th inst. The other contestants were: Ten Eyck and Scriber, of Peekskill; Bates and Denman, of Newburg; Smiley and Downing, of Brooklyn; Mosher and Dolson, of Fishkill; Devan and Redfield, of New York, and Parent and Hubbard, of Cornwall.

The events Saturday were:

Amateur four-oared shells; three miles. Won by the Wovenhook Club in 20m 58s. The Eureka, the only contesting crew, came in 25s later.

Single-scutt race for working boats; open to all. Won by J A Ten Eyck, of Peekskill; Al Darrah second.

Pair-oared shell race; same distance. Of the three crews, two were composed of members of the Ward family. One of the Ward crews took first prize in 22m 30s; the other Ward crew coming in second.

NEW JERSEY—*Aug. 30.*—At the Fairhaven regatta the prizes were awarded as follows: To the Edward Mintrun \$40; to the Josephine, \$30; to the Ada Taylor, silver cup; to the Florence, \$20; to the Amelia a suit of colors.

FLORIDA.—The Indian River Yacht Club held their regatta at Titusville yesterday.

## Rational Pastimes.

**NEW JERSEY—Providence Caledonian Society.**—The seventh annual excursion of the Providence Caledonian Society to Rocky Point last Friday, Aug. 31, was participated in by the sister societies of New York and New England. The sports and festivities were highly successful, opening with a Scotch reel, and concluding with a collation in the evening at Caledonian Hall. Following is a summary of the contests:

**Putting the Stone.**—The competitors: Jno. Sample, Wm. Robertson of New York, E. W. Johnson of Hamilton, Ont., D. C. Ross of Hamilton, Ont., and John King. The stone weighed sixteen pounds, and was thrown by the victor, Wm. Robertson, to the distance of 35 feet 4 1/2 inches. A tie between Johnson and Ross was thrown off, Ross taking the second and Johnson the third prize; distance, 35 ft. 6 in., and 55 ft. 2 in., respectively.

**Running Long Leap.**—Among eight competitors, A. C. Reid, of Hamilton, Ont., took first prize; distance, 20 ft 1 in; John Sheffield, of Fall River, Mass., second; distance, 19 ft 10 in; John McCaffrey, of Pawtucket, 19 ft 1 in.

**Throwing the Hammer.**—Five competitors: D. C. Ross, of Hamilton, Ont., took first prize, throwing the eighteen pound hammer 87 ft 1 in; Wm. Robertson, of New York, 81 ft; J. T. Crossley, of Frankfort, Pa., 79 ft 1 in.

**Half-Mile Race.**—Six contestants. Won by Robt. Hindell, of Paisley, Scotland, 2m 5s; John Maloney, of Fall River, second; John Bridgewater, third.

**Hurdle Race.**—There were seven competitors. B. Hindell won the first prize; John Maloney, second; A. C. Reid, third.

**Highland Fling.**—Entries: Donald McBean, J. Kennedy, Thomas T. Murray, William Robertson, George Bothwick. The dancing was to the music of the bagpipe. Kennedy won first; Robertson second; Murray third.

**Sack Race.**—There were five entries. The distance was once around the ring over five hurdles, eighteen inches high. John Crossley took first prize, William Robertson, second, and R. B. Robertson, of Fall River, third.

**Hitch and Kick.**—This was a long contest, and resulted in A. M. Donaldson, of Fall River, kicking 8 ft and 8 in, and taking first prize. Second and third prizes divided between Robert Easdon and A. C. Reid.

**Hop, Step and Jump.**—Ten entries. The first prize taken by John Sheffield, 44 ft 7 in; second, by Michael Lynskey, 44 ft 6 in; the third to John Maloney, 43 ft 2 in.

**Boys' Race.**—Won by Walter Dobson, Dennis Cronan and Robt. McAbury, all of Providence.

**Vaulting with Pole.**—Five entries. Won by Wm. Robertson, 10 ft; Robert Easdon, 9 ft 10 in; and Michael Lynskey, 9 ft 1 in.

**Three-Legged Race.**—Sixteen entries. Robertson and Reid, first; Haskins and Southernland, second. Third prize divided between Lynskey and Reed and Crossley and Maloney.

**One-Mile Walk.**—The first prize was taken by Wm. Brown; second, by L. C. Dole, third by Frank Schwenk.

**Standing High Leap.**—E. W. Johnson took first money, John McCaffrey second, and A. C. Reid and Michael Lynskey divided third.

**Tossing the Caber.**—D. C. Ross took first prize, E. W. Johnson second and James O'Tourke third.

**Running High Leap.**—E. W. Johnson first prize, A. C. Reid second and Wm. Robinson third.

**One Mile Walking Race.**—This was the most interesting race of the day. Among the entries were Lester C. Dole, of New Haven, Robert Hindell, the champion of the world, and John Sample, of South Bridgeport, Mass. Dole lead the first five rounds, and on the sixth round Hindell and Dole were abreast. At this point Sample passed both, and the excitement became intense. Hindell, who had been going at a lazy gait, gave a farwelling glance at Dole and passed Sample. While coming around on the ninth round, Hindell spurted, leaving Sample a few yards in the rear, and the Scotchman came in an easy winner, Sample second and Dole third. The mile was made in the remarkable time of six minutes and forty seconds.

**NEW YORK—Harlem Athletic Club, Mott Haven, Sept. 1.**—The second annual meeting of this club was marked by general excellence in the several events. The contests were as follows: One hundred yards race—The first race was won by F. Saportis, in 11 1/4 s; W. Holden, second. Second race won by W. B. Curtis, in 11 s; H. Louterbach, second. Third race, a dead heat between F. Henshaw and E. B. Foote, in 11 1/4 s.

**One Mile Run.**—Eight entries. Won by R. Morgan in 4m. 40s.; C. Vaught, second.

**One-mile Walk.**—Seven entries, won by E. C. Holske, in 7m. 26s.; W. Barnes, second. Throwing the Hammer.—G. D. Parnley won, by throwing 82 ft.

**Four hundred and forty yards run.**—W. H. Griffin won in 69s.; W. Childs, second. T. Roberts won second heat, in 64s.; J. Horn won third heat; and J. H. Ferguson the fourth.

**Pole Vaulting.**—L. Freeman won by a vault of 8 ft. 10 in.

**Two hundred and twenty yards run.**—The first second and third heats were won respectively by Saportis, Anderson and Childs.

**Four-miles Walk.**—Among nine contestants E. C. Holske won in 32m. 02s.; T. H. Armstrong, ten seconds later.

**Four hundred and forty yards run.**—Three entries; won by Roberts in 57s.

**Broad Running Jump.**—Won by W. T. Livingston, who made 18 ft. 7 in.

**Hitch and Kick.**—Won by A. H. Oakes, who kicked a tambourine, suspended at a height of 8 ft. 3 in. T. Nichols was next; he accomplished the feat at 7 ft. 9 in.

**In the half-mile run Mr. F. Banham in 2m. 5s.; Richard Morgan second. The concluding event was a handicap club race, which Diblet won in 11s.; White second, Kenshaw third.**

**LACROSSE.**—A lacrosse match for the championship of the world, was played at Toronto, Ontario, September 1, between the Shamrocks, of Montreal, and the Athletics, of Toronto. The game was played according to the English rules, the club having the most games at the end of two hours to be declared winner. The match was won by the Shamrocks, 2 to 1.

**MONTREAL, Aug. 25.**—The Caledonian Society held their annual athletic sports to-day on the Montreal Lacrosse grounds, with the following result:

**Quoits.**—W. Ogilvie, 1st prize; D. Rothwell, 2d; D. Christie, 3d.

**Throwing heavy hammer.**—J. Mundie, 76 ft. 9 in., 1st prize; Luke McKay, 72 ft. 10 in., 2nd; A. Rennie, 71 ft. 8 in., 3rd.

**Throwing light hammer.**—Luke McKee, 89 ft. 7 in., 1st prize; A. Rennie, 87 ft. 1 in., 2d; J. Mundie, 85 ft. 7 in., 3d.

**Throwing light stone.** 14 lbs.—A. C. Rosseau, 39 ft. 7 1/2 in., 1st prize; Wm. Ryan, 38 ft., 2d; Wm. Judge, 34 ft. 7 in., 3d.

**Running hop, step and jump.**—James Newton, 41 ft., 1st prize; A. C. Rosseau, 40 ft., 2d.

**Highland fling in Highland costume.**—R. J. McDonald, 1st prize; Alex. Niven, 2d.

**Vaulting with pole.**—Rosseau, 9 ft. 9 in., 1st prize; John Anderson and Thos. McMann (equal), 9 ft. 8 in., 2d and 3d.

**MARRIED VS. SINGLE MEMBERS OF THE ST. GEORGE AND STATEN ISLAND CLUBS.**—The first of a proposed series of matches was played on the Hoboken grounds last Saturday. The Score resulted as follows:

| First Inning.                              |    | Second Inning.                |    |

**SWIMMING ACROSS THE ENGLISH CHANNEL.**—The Channel has again been successfully crossed, this time by Cavill, who accomplished this feat in about twelve hours.

## AMUSEMENTS.

"The Danites" hold forth at the New Broadway Theatre.

The Grand Opera House opened Monday night with F. S. Chanfrau in "Kit."

"The Dark City," Mr. Daly's new local play, was produced at the Fifth Avenue Theatre Tuesday night, with new scenery, etc.

"The Wild Flower of Mexico" is the title of a spectacular and effective drama which holds the boards at Niblo's.

"Pink Dominoes" will be played only the 17th at the Union Square Theatre, when the Williams' open in their new drama of "Struck Oil."

"Oxygen," which will be continued at Wallack's Theatre this week, has for the basis of its story Jules Verne's amusing story of the waking up of a very Rip Van Winkish Dutch town by an immense dose of oxygen, administered by Dr. Ox. Plenty of dancing and song, of course.

"The Crushed Tragedian" is the title of the new play which holds the boards at the Park Theatre, with Mr. Sothern in the leading role. Mr. Sothern is a popular actor, and as a new play with an old favorite is always a strong combination, the season opened Monday night with a large and brilliant audience. Even standing room was not to be had. The play was heartily applauded throughout, the curtain being raised at the end of each act, and at the conclusion Mr. Sothern was called upon for a speech, a compliment he gracefully acknowledged in a few words of thanks.

**Tiffany & Co., Silversmiths, Jewelers, and Importers,** have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their Timing Watches are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. PATEK, PHILIPPE & Co., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Bronzes and Artistic Pottery is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. Union Square, New York

## Publications.

NOW READY, THE

## Sportsman's Gazetteer

AND

## GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS.

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE

"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

"FOREST AND STREAM" PUBLISHING COMPANY.

The book is a complete manual for sportsmen: It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species, describes, with the habitat and breeding season of each—a most valuable contribution to science.

It describes 297 varieties of edible fish alone, that may be taken with the hook; 30 varieties of ducks, 30 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been pronounced by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for all wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

## LONG-RANGE

## RIFLE SHOOTING.

A Complete History of the International Long-Range Matches, 1873-1877—Complete Elcho Shield Scores—Rules and Regulations of the N. R. A. Etc., Etc.

## FULLY ILLUSTRATED

BY THE

RIFLE EDITOR OF THE "FOREST AND STREAM AND ROD AND GUN."

NEW YORK.

A first-class Coat. No shooting outfit complete without it. Pleasant to wear, durable, and in the end the cheapest.

**MADE OF BROWN VELVETEEN.**

Pockets and lining made to take out, so that it may be worn for early fall or winter shooting. (Hornace Smith, Esq., says it is just his idea of a shooting coat.) For sale by

**H. C. SQUIRES, 1 Cortlandt St., N. Y.,**

Or **F. L. SHELDON, Rahway, N. J.**

Rules for measurement and samples sent upon application. Prices ranging from \$15 to \$30. A220 tf

ESTABLISHED IN 1837.

Consult your interest by sending for our revised and reduced prices.

**Excelsior** LAESTER IMPROVEMENT.

Double Treadle, including one does Saws, thirty imitable Tred Sawing Patterns and prepared Wood, to the value of \$4. A new device for tightening Saws, Power Drilling attachment, Wrench, Oil Cup and Screw Driver. Speed, 200 strokes per minute. Saws, 1 1/2 inch thick. Price, complete, case and delivered on board cars or at Express office, \$12.

Saw only, without attachments, \$9.

**SMALL STEAM ENGINES.**

With Copper Boiler, to drive light Lathes, Scroll Saws, etc. Are all sizes from 1-8 up to 2 horse power; either plain castings, partly finished, or complete, ready for use.

The "Scientific American" of June 10, 1875, says of the above, in an extended Editorial, introducing our manufactures to the public: "It can turn wringers, churns, washing machines, or ice cream freezers, run coffee mills, pump water through a house, actuate foot lathes, scroll saws or light boxing machinery, run knitting or sewing machines, turn a grindstone or emery wheel, work ventilating or hand threshing machine cutters, meat or feed choppers, or sausage machines, drive small blowers for pneumatic dispatch tubes in a building, or for a 1 1/2 mile's length of pipe, or compress air or work an air pump on a small scale in a laboratory. These are a few only of the purposes to which it can be applied."

Also Engines and Boilers capable of propelling 25 to 35 inches. The boats have keel, stem, with rudder and tiller, row locks and cases. Those wishing a pleasure boat will find water for exploring expeditions and surviving parties. The Engine and Boiler can be easily detached from the boat, and is then available for Agricultural, Mechanical, Commercial or Domestic requirements or for the use of Amateurs, when power is needed for running light machinery.

Price of 10 foot boat, complete, \$425.00

Price of Engine and Boiler, without boat, including driving pulley, \$125.00

Illustrated Catalogue containing One Hundred Scroll Work Designs mailed to any address free on receipt of Stamp.

**GEORGE FARR, BUFFALO, N. Y., U. S. A.**

**LYMAN'S PATENT BOW-FACING ROWING GEAR.**

This invention enables an Oarsman to see where he is going. He sits with his face to the bow. Every rower knows how awkward it is when pulling single, or as bow-oar in a crew, to have to turn and watch the course. By using this arrangement the rower is brought into his proper position, and he can row as he would drive. There is NO LOSS OF POWER. Send for circular, directions and opinions of the press to the Patentee,

**WILLIAM LYMAN, Middlefield, Conn.**

OFFICE IN NEW YORK, 32 CORTLANDT STREET.

dec 25-1y

**The Kennel.**

**EMPIRE STATE KENNEL, BROOKLYN, L. I.**

**BRILLIANCE—RUFUS.**

We are now looking orders for blood-red Irish setter puppies, whelped Aug. 15, 1875, out of our red Irish setter bitch Belle (Prize winners: Second at Mineola, L. I., and Centennial medal and diploma), by Arnold Bury's champion Rufus. These puppies (eight dogs and three bitches) are the handsomest we have ever seen; they are all red, with no white, and, in appearance, like their mother's. Rufus is one of the best bred and handsomest dogs in the country, and winner of more show prizes than any other Irish dog, having gained three abroad and six in the U. S., including the Irish championship at New York (beating Elcho) and struck dog champion. Rufus is the sire of the following noted prize winners, all of one litter: Rufus II., Centennial Irish champion; Rory O'More, first New York (beating the get of Elcho and Plunkett); Fire Fly, first Centennial and second New York; 1st prize, second Centennial, and Fanchon first Kansas City. Belle is very handsome, being the heaviest feathered bitch in America. She is thoroughly broken on all kinds of game. For price, etc., address FISHER & BICKERTON, 179 Flatbush Avenue, Brooklyn, L. I.

### THE "FISHING LINE."

### Brook Trout, Grayling and

### Black Bass Fisheries

OF NORTHERN MICHIGAN, VIA

### Grand Rapids and Indiana Railroad.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly or trolled a spoon in the waters of the Grand Traverse Region will come again without solicitation. An other lover of the Rod are invited to try these waters, wherein

The fish names above, as also Muscunelange,

Pike and Pickerel, abound.

In no other streams east of the Rocky Mountains is the famous American Grayling found in such numbers.

Brook Trout Season opens May 1st.

Grayling Season opens June 1st.

The Sportsman can readily send trophies of his skill to his friends or "Club" at home, as ice for packing fish can be had at many points.

Take your family with you. The scenery of the North Woods and lakes is very beautiful. The air is pure, dry, and bracing. The climate peculiarly beneficial to those suffering with hay fever and asthma.

The Hotel Accommodations, while plain, are, as a rule, good, far surpassing the average in countries new enough to afford the finest of fishing.

After June 1st Round Trip Excursion Tickets sold to Point in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also, on and after July 1st, Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns, and Fishing Tackle Carried Free at owner's risk.

Camp Cars for Fishing Parties and Families at low rates.

It is our aim to make sportsmen feel "at home" on his route. For Tourists' Guide, containing full information as to Hotels, Boats, Guides, etc., and accurate maps of the Fishing Grounds, send to Forest and Stream office, or address

J. H. PAGE, G. P. & T. A., Grand Rapids, Mich.

Lafin & Rand Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of  
Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6 1/2 lbs. each, and canisters of 1 and 5 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFFG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs. and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb. All of the above give high velocities and are less resiliant than any other brands made, and are recommended and used by Capt. A. H. HOGARDUS, the "Champion Wing Shot of the World." **BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS.** MY ITALY POWDER of all kinds on hand and made to order. Safety Fuse, Frictional and Platinum Fuses.  
Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

THE  
HAZARD POWDER CO.  
MANUFACTURERS OF  
GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 3 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For lead, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/2 lbs., and cans of 5 lbs. FFFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting and the "Sea Shooting" FG is the standard Rifle powder of the country.

**Superior Mining and Blasting Powder.**  
GOVERNMENT CANNON & MUSKET POWDER;  
Also, special Explosive for EXPORT OF  
ANY REQUIRED GRAIN OR PROOF, MANU-  
FACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

88 WALL STREET, NEW YORK.

THE  
New Dittmar Powder.

THE CHAMPION POWDER OF THE WORLD  
For all off-hand shooting at short and long ranges. Unsurpassed for Cleanliness. Pleasant to shoot on account of little recoil and report. Desirable for hunting on account of little or no smoke. Unequalled for rapid firing, as it does not foul and heat up the barrel as black powder. Great accuracy, penetration and good pattern. Safer than black powder. Address  
CARL DITTMAR, NEPONSET, MASS.

New York, July 10, 1877.

EDITOR FOREST AND STREAM AND ROD AND GUN:

Please say, for the information of some of my friends who may be misled by current statements, that I am still on the same powder for all out-door shooting, which I have used for several years past, never having risked the use of the nitrated powders except when shooting in a confined space in-doors, when the smoke from any regular powder would produce a small rather offensive to some people, and cause somewhat greater obstruction to vision.

CAPT. A. H. HOGARDUS,  
Champion Wing Shot of the World.

Sportsmen's Goods.

BOSTON

SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,

BOSTON.

Each article—coat, trousers, vest and hat—have the name and manufacturer's address stamped upon it, and no suit is genuine without it bears this imprint.

The suit can be sent, securely packed, by mail to any part of the United States or Canada on receipt of \$1.25 above the price of the suit.

We make no discount except to the trade. We make but one quality, and that is the VERY BEST. The price of the suit complete is \$13.

The suit consists of coat, trousers, vest and choice of either cap with havelock, or hat.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are riveted, and nothing is neglected to make the whole suit complete in every way.

OUR HUNTING SHOES,

which are considered the best in use, are also sent by mail at an advance of 35 cents above the price \$5.50 per pair. These shoes are made to our special order to match our suits, and the design of the whole embraces the best points of the English and French equipments, combined with all necessary requirements for American service.

Such a popularity as the "Boston Shooting Suit" enjoys, has never been attained by any other similar garment in this country. It is in constant demand from all parts of America, and orders have been filled for Canada and England.

"Shipping clothing to England strikes us very much like sending 'coals to Newcastle,' but the merits of the BOSTON SHOOTING SUITS have been heard of in the Old Country, and that land of sportsmen has sent an order to Messrs. Simmons & Son, which will doubtless be followed by many others."—Boston Paper.

The author of "Tales of the Adirondacks," the Rev. W. H. Murray, one of our most enthusiastic sportsmen, says of it:

"We were shown the other day a new waterproof suit, specially adapted for sportsmen, designed and made up by Simmons & Son, of Boston, and to which we call the attention of all brethren of the out-door and shore-shooting fraternity, because it meets the demand of personal comfort and convenience beyond anything of home manufacture seen by us before. As a sportsman, we give it our unqualified endorsement, as combining the best points of the English suits, and in addition skillfully adapted to the necessities of the American service. It is a most admirable and satisfactory contrivance in color, style, waterproof quality and capacity. The coat is a marvel in this latter respect."

THE FOREST AND STREAM SAYS:

THE BOSTON SHOOTING SUIT.—One of the most successful manufacturers of waterproof shooting suits is the firm of G. W. Simmons & Son, Oak Hall, Boston. We had one of their suits on duty at Hunter's Camp, at Philadelphia Centennial Exhibition. It has grown gray in service, but is good for use yet. This suit is known as the "Boston Shooting Suit," in contradistinction no doubt, from the garments which are manufactured out West and at Washington, each of which has a local demand of its own.

A letter from San Francisco, Cal., says:

G. W. Simmons & Son:

GENTLEMEN—I have this day received the "Boston Shooting Suits" ordered from you on the 16th. My object in writing is simply to say that they came to hand by mail in perfect order, and I am more than satisfied with each article. They are all, if not more, than represented in your advertisement in Forest and Stream. They supply a want long felt here, and we have no doubt many will be ordered. I am obliged to you for sending by mail and thereby saving me several dollars. Enclosed please find a check to repay you for postage.

Yours very truly,

A letter from Iowa says: "My suit was received this P. M. It is entirely satisfactory in every way. Thanks for your promptness."

A letter from Indiana says:

DEAR SIRS—The suits came this morning and gave great satisfaction. I would like to order nine more. Hundreds of testimonials could be added.

DIRECTIONS FOR MEASUREMENT.

Around the breast. Inside seam of pantaloons.  
Around the waist. Size of head.  
Inside of seam or coat. Mention height and weight sleeve.

Price of Suit complete, with choice of hat or cap, \$13  
Note again, the coat and vest are all double-seamed, each pocket being riveted at corners with copper rivets. French hunting buttons on coat and vest. Each button-hole made of leather. The whole suit as described above is made of 10-oz. army duck, water-proofed by a patent process, and colored to the shade of dead grass. Each suit distinctly marked.

For those who prefer, we make a hunter's coat, with sleeves attached to the vest. We make but one grade of suit, and that is the very best in every particular.

An illustrated circular, containing full description of each garment, with sample of the material from which made, will be sent free on application.

Is really wonderful. Illustrated catalogue mailed on receipt of postage of four cents.

ESTABLISHED 1840.

## Gale's Patent Tents,

Adapted to all purposes where Lawn, Beach, Hunters' and Camp Tents are used; are eight feet high, seven feet square at bottom, will lodge four persons; can be set up or taken down and packed in five minutes, making a bundle four feet long, of twenty-five pounds weight. The pole in two parts, is joined together by a brass tube. They are wonderfully light, and yet very strong, and are the handiest and cheapest tents extant. Samples of goods and price list sent free, and the tent sent on receipt of price, or C. O. D. Prices from \$10 to \$15.

GALE &amp; CO.,

Boston, Mass.

## Painting.

## PAINTING.

EVERY ONE THEIR OWN PAINTER.

50 Per Cent. Saved.

We are manufacturing a very fine Pure Ready-mixed Paint, mixed in such a manner that any ordinary stable or farm hand can make as good a job painting as a painter can with paint mixed in the old way. This is because our paint does not set quick, and thus show marks of the brush. We sell it lower than materials can be bought in the ordinary way, and pay freight in certain sized orders.

Any gentleman wishing to paint up his buildings at small expense had better write, and have sent free our book.

Address 260 Front street,

TRIPLEX.

marked the PREMIER QUALITY

[Extract from FOREST AND STREAM, New York, December 25, 1878. Contributed by one of the Judges of  
Awards of Guns at the Centennial.]

"This action (The Triplex Lever Grip) combines in the highest degree strength and simplicity, and must  
rapidly secure the favor of all who test its merits.

COMPENSATING LUMP. Strongly recommended. It is invaluable, and should be ordered on  
every gun. Costs about \$10 extra. Choke-bores, medium or full. Our guns to be had of the principal  
dealers in the trade only.

PREMIER GUN WORKS, Birmingham, England.

## Paper and Metallic Shells

FOR

## Breech-Loading Shot Guns,

Manufactured by the

UNION METALLIC CARTRIDGE CO.,

BRIDGEPORT, CONN.

BERDAN'S PATENT  
SOLID ANVIL.

THE STURTEVANT SHELLS are the easiest reloaded.  
Do not have to unscrew the head nor use an awl to remove  
the exploded caps. THE PATENT MOVABLE ANVILS,  
made of steel wire, will not bend or break.

THE BERDAN PATENT SHELLS, new model, with  
Hobbs' patented waterproof primers, never miss fire, and are  
highly prized by all that have used them.

PAPER SHELLS.—By repeated experiments and great  
outlay for improved materials, and machinery made ex-  
pressly for the purpose, we can now warrant our BROWN  
PAPER SHELLS equal to any imported. They are sure  
fire, and will not burst in the gun.

Inquire of any of the dealers in sporting materials for  
the U. M. C. Co.'s Shells.

Not sold at retail by the manufacturers.

STURTEVANT'S PATENT  
MOVABLE ANVIL.

## "St. Louis Conical Base Paper Shell."

ST. LOUIS  
CONICAL BASE SHELL

Having made important improvements in our Shell, we  
can safely recommend them as equal, if not superior, in  
quality to any Paper Shell manufactured in this country or  
in Europe.

Among the advantages claimed for these Shells, are: A  
saving of 25 per cent. in the use of powder; also the great  
decrease in recoil. The sizes made are No. 10—2½, 2½,  
and 3 inches; No. 12—2½, 2½, and 2½ inches. Longer  
and 3 inches; No. 12—2½, 2½, and 2½ inches. Longer

Shells will be made at extra cost. They are not available. Sample, 100, sent by express on receipt of \$1.15  
for No. 12; \$1.30 for No. 10.

Factory and office, No. 2,239 De Kalb street, St. Louis, Mo.

St. Louis Patent Shell Manufacturing Company.

Capt. Bogardus' Patent Glass Ball Trap  
and Rough Balls.

These Traps and Balls patented by Bogardus and used by him many  
thousand times, proves them to be just what is wanted by all

SPORTSMEN'S CLUBS AND AMATEURS.

THE PATENT ROUGH BALL—The only Ball that will break sure  
when hit by shot. Use none but the best. Every ball marked. Patented  
April 10, 1877; Traps, March 13, 1877.

Geo. E. Hart & Co.,

NEWARK, N. J.

TRADE SUPPLIED.

HUBER & MERWIN'S CHAMPION BALL TRAP.

This certifies that I have used every trap in market, and find the CHAMPION GLASS BALL TRAP,  
for durability and perfection of its operation, superior to them all, and take pleasure in recommending  
the "Champion" to sporting clubs and my friends. (Signed)  
Aug 19

We call the attention of the fraternity  
to the above trap, claiming to be the  
plus ultra. It combines compactness  
with durability, and is arranged, by a  
swivel on the bed-plate, to throw a ball  
in any direction or at any elevation un-  
known to the shooter, a screen prevent-  
ing his seeing the direction in which the  
trap is set.

The spring, as the cnt will show, is  
made of a steel rod or wire, bent spirally  
at the point of attachment, thus receiving  
the concussion its entire length, and pre-  
venting breakage.

PRICE \$10.

FOR SALE BY

BARTON & CO., Sole Agents,

337 BROADWAY, NEW YORK.

Also the CHAMPION GLASS BALL TRAP,  
for durability and perfection of its operation, superior to them all, and take pleasure in recommending  
the "Champion" to sporting clubs and my friends. (Signed)  
IRA A. PAINE.

Founded July 4, 1808.

Thos. W. Sparks,

## Shot &amp; Bar Lead

MANUFACTURER.

Office 121 Walnut Street, Philadelphia.

Sportmen's Goods.

W. H. HOLABIRD,

Manufacturer of

Specialties in Clothing  
FOR SPORTSMEN.  
Valparaiso, Ind.

Shooting Suits complete, consisting of Coat, Vest,  
Pants and Cap, \$10. No. 1 Shooting Coats, water-  
proof and first-class in every particular, sent by  
mail, post-paid, \$6.

Holabird's New Game Bag; weighs 13 ounces.  
The most convenient and coolest garment ever  
offered to Sportsmen. Can be used in place of a  
coat; room for 50 shells; and 75 snipe or quail; by  
mail for \$2.

Holabird's New Cartridge Vest, capacity for fifty  
shells; simple and admirable for boat shooting;  
\$2.50. Fine Linen, Corduroy and Fustian suits made  
to order in the neatest and most desirable style.

Send 25 cents for my book on Dog Breaking and  
catalogue of goods. Money refunded if not satisfied.

## NO MORE BROKEN GLASS!

Paine & Holberton's composition balls can be used  
in any trap. Patent applied for.

Price per 100.....\$3

This ball is perfectly harmless, and is a benefit to  
have rather than an injury. Many accidents have  
occurred from the broken glass balls, and every day  
it is becoming more difficult to find places to prac-  
tice with the glass balls. These balls come packed  
500 in a barrel.

W. HOLBERTON, Sole Agent,

P. O. Box 5,100. 102 Nassau Street, N. Y.

### THE KING OF THE BROOK.

Give me the rod and reel,  
The wee strong line and the keen-barbed hook;  
Give me the joy all true fishers feel  
Who vanquish the King of the Brook!

He is a goodly prince:  
In his royal robe of red and gold,  
Like a sultan's, rich with sheeny tints,  
How he darts through the water cold!

A kingly home is his:  
The sparkling pool in the mad spring stream!  
Name me the palace brighter than this  
In the silvery ripple's gleam.

Ah, 'tis a glory rare,  
With footstep soft, and with bated breath,  
To tempt the king from his fastness fair,  
And battle him unto the death!

He dies as monarchs die  
Who of dastardly fear give no sign,  
But fight for life till their latest sigh—  
Royal proof of his royal line!

Ye who extol the town,  
Take it's wealth, its pride, its fleeting joys,  
Its mansions high, with their fronts of brown,  
Its beauty, its fashions, its toys.

But give me rod and reel,  
The wee strong line and the keen-barbed hook;  
Give me the joy all true fishers feel  
Who vanquish the King of the Brook!

M. A. KINGSFORD.

### Anglimania.

TIME was, when the approach of spring infused a quicker life into these veins—when the warming of the sun and the singing of purling streams sent me, with lithe limbs, up among the hills and high valleys, a devotee of that edifying religion taught by St. Izaak—the Art of Angling.

"That true joy that anglers feel" is little known by him who sits the live long day with his legs dangling over a dusty wharf feeling for flounders with a hoop-pole and chalk-line; nor yet by him, who, "rocked on the rolling deep," till his very stomach goes out of him, tugs away at a cod, or eke a halibut, till his fingers are worn to the bone, by much grabbing and gripping of the line, and flourishing of the gaff and the "mun-tle." Doubtless, the hearing something drop in the dust behind one, "flat as a flounder," has its little satisfactions—with reference to the frying-pan. The writer has himself experienced the laborious rapture of the strife in snaking and being snaked, alternately by a fifty-pound cod or a two hundred-pound halibut under the disadvantages of a strong tide, a forty fathom line and a five-pound lead; and he is able to say it is very like undergoing comfort. But after finishing a work of this kind, I never, when the season came around, felt an uncontrollable desire to go back and do it again.

But if there is anything in this world capable of affording unalloyed happiness, it's what the Shepherd, in "The Noctes," calls "throwing the flee" for the speckled denizens of the clear brooks and cool lakes. And he who has the gift, and has once acquired the skill, requisite to success, will prize this above all sports. He will become possessed of an anglimania. He will never see the glint of clear water but that he will look, happy, for the rainbow flash of the trout or listen for his spiteful break and quick plunge as he takes the flying game. And the true angler will take no more delight in looking upon a weedy pickerel-pond or a bullhead slue than in contemplating the black flood of Styx or Cocytus.

The trout, though a fastidious epicure, is greedy; and, if you know how to do it, and where to look for him, can be caught at almost all times and seasons, and even through the ice.

It is the custom in many places as soon as the snow is nearly gone and the ground thawed enough to dig worms, to sally forth eager for the first haul, and by soaking at the bottom of deep pools to catch a mess of trout. The poor, half-starved fish, not yet recovered from spawning, dull and stupid, manage to gorge the bait and are, with scarce a struggle, lifted out upon the bank. Their heads look large, their bodies are thin and flabby, their colors dim, and, as a luxury for the

table, they are hardly up to a sucker from the same waters. And yet these pot-poachers carry them home—usually with a few big chubs to grace (grease) the "string"—cook them with boue-pork in order to get a "game flavor," crack Jersey champagne over them, and boast of their exploits in trout fishing!

Then there is another class of trout fishers—save the mark!—who, from April to November, plunge into small streams with nets, baskets, lines, poles, etc., and literally "clean them out." And you will hear these fellows, too, brag over the splendid lot of trout they caught. Caught—Eh!

If I were a keeper of sheep, and not of fish, and had such fellows for neighbors, I should hope they wouldn't get sick of fish and begin to hanker after mutton.

In most waters in New York State the trout does not begin to take the fly in a manner satisfactory to the adept until—varying in different waters—from the 1st of June to the 1st of July. Indeed, my experience would put these limits nearly a month later. But on the southern slope of Long Island they affect to kill trout with the fly as early as the 1st of March; and in the celebrated Caledonia Spring it is said they may be killed in that way every month in the year. The trout, in brooks, is never in perfection until, leaving the sluggish waters, he is found in the rifts, and in lakes and deep rivers in the spring-holes.

Then it is that he begins to jump at the natural fly, and, after a few hot days and muggy nights, becomes capable of verifying that rather spry comparison expressed by the phrase, "quicker'n lightning." If the "Culprit Fay" had been condemned (instead of thrusting a dipper under the clumsy leap of a sturgeon) to catch one of the diamond drops under the rainbow arch of a trout, when in his prime he flips a fly, it is altogether probable that his high crime and misdemeanor of loving a mortal maid, would have been unatoned for still. In fact, it is possible that he would have given up the task in despair, and have gone and done it again just like any mortal.

For my part I struggle against the seductions of spring mornings, April showers and May suns. Even the glory of the apple blossoms cannot now entice me to the stream's side with minnow, grub, worm or spinner. But when the delicious air is laden with the aroma of the red clover blooms, sweet beyond all "the spicy gales of Araby the blest," then on some day, when a haze dims the brightness of the sun and a light cloud now and then hides his reddening disk, a warm southern or western breeze the while just curling the surface of the pools and broad shallows, set me down with a slow mate that loves "to go a angling," by some generous stream where saw-mills and tanneries and nets and sheep thieves are not, and then leave me "lapped in Elysium."

And now for the tackle. For a bait-rod you may use anything except a fly-rod. Fly-rods may be of any weight from the heavy ones for salmon down to those weighing six ounces for trout. Doubtless the strongest rod for its weight and the lightest rod for its strength is the Hexagonal, or six-splint bamboo; and these, as I think, are made in their perfection by Leonard, of Bangor, and Doctor Fowler, of Ithaca, N. Y. In length the rod should be from nine feet to eighteen feet. The latter is the length prescribed in "The Complete Angler." Those who have become habituated to any length will be apt to prefer that. Thirty years ago or so I found in the wilds of Pine Creek, in the month of June, a genial old gentleman whose religion was trout fishing. He was a brother of that Richard D. Davis, of Poughkeepsie, whose eloquence in the Hard Cider Campaign of 1840 charmed and carried away captive all hearts, whether of friend or foe; and whose maiden speech in the House of Representatives, Henry Clay and his compeers ran from the Senate Chamber to hear. This disciple of St. Izaak had a wilderness of all sorts of fishing apparatus. But his glory was a Conroy rod with a multiplier which held a hundred yards of line.

This rod was a *chef d'œuvre* of workmanship in those days, and when put together was twenty-one feet long. Interpolated by a native wherefore he used "such a long fish pole," he said he had been told that the townships about there severally had a regulation prohibiting non-residents from entering within their bounds and catching trout; and he had had this rod made so as to stand in one township and fish in the one adjoining.

It is a triumph of art and a streak of good luck for the best fabricator to produce a fly-rod that shall be perfect in all its parts. Some, like a rheumatic man, are stiff in the joints,

and recoil from the spring with a harsh jar, which is communicated to the hand. Some others, looking like the very doubles of the former, are so elastic and so lithe that the hand will feel the pitch and the recoil no more than it would the graceful swinging of the pendules of the willow. The rod must not be too yielding toward the hand, for then the motion will be weak, but so graduated that a quick turn of the wrist will send an increasing wave of motion to the tip as quickly as the brain sends its volition through the nerves.

The reel, like a woman, may be single or a multiplier. I used for many years a Conroy multiplier—the best in its day—but far too heavy. Now, the Orvis perforated, the Celluloid and Doctor Fowler's hard rubber reel, the last weighing only one ounce for a trout rod, are all that can be asked for ease and perfection of work. The line should be smooth and strong and small, and as heavy as possible in proportion to the size. Smallness and weight are well obtained by a silk line, braided, saturated with a paint composed of white lead and oil, and brought to a lead-color by lamp-black. The line for trout should not be less than thirty yards. Good fly-fishers differ as to the best length of the casting line and the number of flies. I have always used on ponds and large streams a casting-line of ten feet, with three flies. In small streams a yard and a half or two yards with one or two flies is better.

Now for the flies. "*Hic labor, hoc opus est.*" It is, no doubt, a fine thing to be competent to sit down on a mossy bank and out of your *omnium gatherum* of white crows' feathers, green monkey's fur, etc., construct a fly just like the living one there on the stream. But I have found it best to buy of those who knew how to tie a fly better than I did. Beyond comparison, the most durable, the most life-like, and in all respects the best flies I had ever seen down to some ten years ago were made by John McBride or in his family. He was a dweller by the Caledonia Spring. I could tell one of his flies from any other as far as I could see it—and so could a trout.

In "fly fysheyng" with an angle," as Dame Juliana Berners bath it, some prefer to fish up and some down stream. A good angler or fly-fisher will fish up or down, as pleases him or the trout; or if requisite will take his game on the flank. Other things being equal I prefer fishing down.

Now, mate, a few casts on a piece of barren water to straighten your line. A dozen yards below, the stream sparkles over a rift, and, growing deeper, eddies under a half immersed log, and then opens into a handsome pool below. Moving carefully and keeping the flies from the ground by springing the rod back and forth as I go, when arrived at just the right spot, I let the gay deceivers fall upon the rift. A bright flash and a quick splash and the wrist—not the arm from the shoulder or even the elbow—answers to the sight and sound as instantaneously as sight and hearing. The elastic rod responds to the signal and the trout is hooked.

At the same instant the tip and the arm group, the rod bends to a parabola. What a flutter! Keel the tip down, holding him there. No chance to play him here. It will not do to let him flounce long with the advantage of this current, nor will it do to let him down under the log into the pool. It is clear that he must come out. But the rod cannot lift him. How? The beach is low and gravelly; step backward, lower the tip and snake him out by sheer strength of the line. Auld Johnny's tackle is true, and there he comes throwing himself end over end. Hurrah! A thrust of a penknife in the neck—that is kindness and mercy—and in a wisp of grass he lies in the creel. Silver and green and gold; beautiful! Thirteen ounces avoirdupois.

All this while—and it wasn't long—my slow mate by a flank movement has hooked the match of mine in the pool below, and having room to play has stepped in with the game, and is carefully playing and taking all the chances. The trout goes this way and that with a desperate rush, but the steady and unrelenting elasticity of the rod checks and turns him, until, tamed at last, he floats, wearied and despairing, to the hand of the patient angler, almost. He is just carefully putting his hand on the capture, and, in stooping, has incautiously given a little slack line. Kerwhollup! The little hook, worn loose by long playing, drops out, and my mate's expectant hand shuts upon water. Reader, you may think Job had his patience pretty well tried, but we don't read of anything like this.

Now I remember me that I am a cripple, and we hipple

along down stream. Still! There was a rise, down where the water taking a deep swirl under the overhanging rock forms a handsome pool shallowing toward us to the shore. Wait a minute, till he gets settled. Now! My mate's flies fall, light as snow flakes, right over the spot where the hungry fellow broke. Jewwssalem! Three jump clear out of the water. Mate is a little startled, and for an instant his right hand forgets its cunning. He only hooks one, and that a light one, which he lifts easily to hand. The other two were whoppers. We draw carefully back out of sight and seat ourselves "sub tegmine fagi." Mate declares he'll never give a fish trout any slack again, and lamenting his luck, we while away a quarter of an hour. This time we practice a little strategy. We divide our forces. I give mate the post of honor—the attack in front. I hobble a circuit, and, approaching above, take position to charge the rear.

One! The casting lines are tossed from the thumb and finger of the left hand; up goes the tip with a jerk, and ten yards out behind go the flies. Two! Forward, out over the pool a yard above it they go, and, slightly recoiling, fall upon the water side by side like insects wearied with a long flight. The monarchs of the pool cannot endure that. Splash, plash, how the water flies and foams. We have them both. No slack this time, and, after a long labor of love, we lay them in our creels. Starry and mottled sides, scarlet fins and rose-pink bellies; one pound four and one pound six.

Again we move gently down the stream. There the capricious brook sheers to the left and cuts in under an alder-shaded bank, bound and kept in place by the interlaced roots. A dark, deep pool, and half over-reached by the branches drooping into the water, there is an open space like an arch beneath; but no skill of casting avails to enter it. How? There is a slight current. I hook the stretcher into a small piece of dry bark, place it carefully in the water some yards above, follow it, giving line, and it floats slowly down through the leafy arch to the lower end of the pool. Wait a second. Just a shake of the rod and the stretcher is free of the bark. The gray deceivers move up stream agitated by a scarce visible tremor of the rod, the dropper dabbling and dancing as it goes. The stretcher is just emerging from the green arch. "A water haul," says mate, "I guess you—thunder!" as a monster breaks like a sperm whale—only with a motion quicker—and gobbles the stretcher. The good line twangs like a fiddle string as the rod comes to its work. But if he gets down among those roots all is lost, and he is too heavy and too ugly for a main pull. O, St. Izaak! we vow a great chub to thy altar, if every thing holds for the space of seven wiggles of a trout's propeller!

In that time, forgetful of neuralgia and rheumatism, I leap in and stride to the opposite bank, keeping a tight rein. Then, risking the last fibre upon the strain, I succeed in persuading the contestant up stream far enough to clear the drooping branches and bring him outside. Here is room and verge enough, and here, after a brave struggle, the gallant fellow surrenders, and floats unresistingly to hand. Killed he weighs by the pocket spring one pound fifteen ounces. We couldn't make him bring down the other ounce, without ballasting him with pebbles, as I once knew an ambitious fisherman to do with a huge lake salmon.

Ugh! how these muscles twinge and these old joints grate as I wade carefully back and mate helps me up the bank.

Upon taking an observation we perceive the clouds have been gathering, and in a moment come a few drops of rain. Below us begins a long ripple, ending in a dark-looking pool seven or eight rods long and two or three wide. It is embowered with high, o'er-arching birches, and on the farther side, toward which the current inclines, the bottom is rough with large stones, and from the bank projects a half sunken tree top.

"Now, mate, while the clouds favor and the frequent drops ripple the surface, cast your flies and your fortunes upon that pool. Hold! what have you?" "Auld Johnny's 'grizzley king' for a stretcher, then the 'poor man's fly' and the 'dark fox' for a dropper."

"All right." I sit down and have the envious pleasure of seeing mate take a pair of half-pounders from the head of the pool. Another and another and another cast, lower and lower down, then over by the tree tops. "There she blows! clear out of the water and looking a cloth-yard long." By the eyes of our dame he hath hooked him! "Room enough—give him line but no slack." Mate and monster have it, forward and back, cross over, chaste down, outside and up the middle, till mate's partner wears and is handed to a grassy seat. Sure as you live he weighed—the trout did—two pounds are seventeen—no, seven ounces. That beats me and mate is "high hook." What a beauty!—the trout, not mate. By the way I never knew a very handsome man to be a good trout fisher, always excepting the present company, and, perhaps, old Dr. Bethune of blessed memory.

Then we discovered that it was 8 P. M. and raining. Taking shelter under the leaning trunk and wide leaves of a great basswood—"unter den Linden"—we spread our humble scrip, and made a late but delicious dinner. There, while the warm shower passed over us, were reviewed our exploits of the day and of other days, discussed the merits and defects of rod and line and flies, forgot the vexations of the world, and were happy.

The rain ceases, the sun blazes out in the West, and the bow of promise springs its seven-hued arch from one hill-top to the other, far to our left, as it were a great bridge spanning the gulf between. The grass shows a fresher green, the air is pure and exhilarating. The ephemera again hover over the stream, and under the dripping birches the small fry are leaping in the pool before us.

"Mate, you are young (he's only about fifty) and a poet withal. Does not this scene of beauty inspire you? Give us an improvisation."

"'Tis pretty," says he. "Nature looks as if she had just washed her face and combed her hair." Throwing back his head he spouted:

"The rainbow in the morning  
'S the sailor's warning;  
'The rainbow at night  
'S the sailor's delight."

"Seems to me I've heard that before." "Seems to me I have too. I'll give you something new:

"The sailor's warning  
'S the rainbow in the morning;  
'The rainbow at night  
'S the rainbow at n—"

Whutter r-r! plung g! and a great boiling eddy goes circling away from just outside the old tree-top. The young cod finished his new stanza with a "Whoop-ly," as he sprang to his feet and clenched his rod.

"Hold on, mate. I hoped to hear from you a real burst of poetic feeling." "Hang it! it's all bursted now. And don't you know expression destroys feeling? No; let us enjoy it in expressive silence. And don't you remember what Mr.

Tickler said to the shepherd? S y s he: 'James, never make verses when you can catch trout with a fly.'" Saying which, mate strode toward the pool. But the flies fell not with the grace and softness which mark the "casts" of the adept, but with a heavy splash as if delivered from the blow of a whip. The result—nothing. It may have been that the trout's "pertikler vanity" wasn't any fly on that line, or it may have been—as I am inclined to believe after all—that he had resolved not to rise. Mate casts along down the pool and lifts to hand a dozen small fry to let the chinks in his creel. Returning, he tries for the sole monarch again, but repeated casts fail to entice him.

"Come, mate, we have enough; let's go. You forget we've twenty miles to drive. Come again some warm evening at dusk, string out the 'Seth Green,' the 'Quaker' and the 'Red Fox,' and you'll raise him the first throw." H.

## INTRODUCTION AND SUCCESSION OF VERTEBRATE LIFE IN AMERICA.\*

By O. C. MARSH.

PRESIDENT OF THE BIOLOGICAL SECTION OF THE AMERICAN ASSOCIATION.

### SECOND PAPER.

REPTILES and Birds form the next great division of vertebrates, the Sauropsida, and of these the Reptiles are the older type, and may be first considered. While it may be stated with certainty that there is at present no evidence of the existence of this group in American rocks older than the Carboniferous, there is some doubt in regard to their appearance even in this period. Various foot-prints which strongly resemble those made by Lizards; a few well preserved remains similar to the corresponding bones in that group; and a few characteristic specimens, nearly identical with those from another order of this class, are known from American Coal Measures. These facts, and some others which point in the same direction, render it probable that we may soon have conclusive evidence of the presence of true Reptiles in this formation, and in our over-lying Permian, which is essentially a part of the same series. In the Permian rocks of Europe, true Reptiles have been found.

The Mesozoic Period has been called the Age of Reptiles, and during its continuance some of the strangest forms of reptilian life made their appearance, and became extinct. Near its commencement, while the Triassic shales and sandstones were being deposited, true reptiles were abundant. Among the most characteristic remains discovered are those of the genus *Belodon*, which is well known also in the Trias of Europe. It belongs to the Thecodont division of Reptiles, which have teeth in distinct sockets, and its nearest affinities are with the Crocodilia, of which order it may be considered the oldest known representative. In the same strata in which the *Belodonts* occur, remains of Dinosaurs are found, and it is a most interesting fact that these highest of reptiles should make their appearance, even in a generalized form, at this stage of the earth's history. The Dinosaurs, although true reptiles in all their more important characters, show certain well marked points of resemblance to existing birds of the order *Ratitia*, a group which includes the Ostriches; and it is not improbable that they were the parent stock from which birds originated.

During Triassic time, the Dinosaurs attained in America an enormous development both in variety of forms and in size. Although comparatively few of their bones have as yet been discovered in the rocks of this country, they have left unmistakable evidence of their presence in the foot-prints and other impressions on the shores of the waters which they frequented. The Triassic sandstone of the Connecticut Valley has long been famous for its fossil foot-prints, especially the so-called "bird-tracks," which are generally supposed to have been made by birds, the tracks of which many of them closely resemble. A careful investigation, however, of nearly all the specimens yet discovered, has convinced me that there is not a particle of evidence that any of these fossil impressions were made by birds. Most of these three-toed tracks were certainly not made by birds; but by quadrupeds, which usually walked upon their hind feet alone, and only occasionally put to the ground their smaller anterior extremities. I have myself detected the impressions of these anterior limbs in connection with the posterior foot-prints of nearly all of the supposed "bird-tracks" described, and have little doubt that they will eventually be found with all. These double impressions are precisely the kind which Dinosaurian reptiles would make, and as the only characteristic bones yet found in the same rocks belong to animals of this group, it is but fair to attribute all these foot-prints to Dinosaurs, even where no impressions of fore-feet have been detected, until some evidence appears that they were made by Birds. I have no doubt that Birds existed at this time, although at present the proof is wanting.

The principal genera of Triassic Reptiles known from osseous remains in this country are, *Amphisaurus* (*Megadactylus*), from the Connecticut Valley, *Bathysuchus*, from Prince Edward's Island, *Belodon* and *Clepsysaurus*. Other generic names which have been applied to foot-prints and to fragmentary remains, need not be here enumerated. A few remains of Reptiles have been found in undoubted Jurassic rocks of America, but they are not sufficiently well determined to be of service in this connection. Others have been reported from supposed Jurassic strata, which are now known to be Cretaceous. It will thus be seen that, although reptilian life was especially abundant during the Triassic and Jurassic periods, but few bones have been found. This is owing in part to the character of most of the rocks then formed, which were not well fitted for preserving such remains, although admirably adapted to retain foot-prints.

During the Cretaceous Period, Reptilian life in America attained its greatest development, and the sediments laid down

in the open seas and estuaries were usually most favorable to the preservation of a faithful record of its various phases. Without such a perfect matrix as some of these deposits afford many of the most interesting vertebrates recently brought to light from this formation would probably have remained unknown. The vast extent of these beds insures, moreover, many future discoveries of interest.

In the lowest Cretaceous strata of the Rocky Mountain region, the Dakota group, part of which at least represent the Wealden of Europe, remains of *Chelonias*, or Turtles, Crocodiles, and Dinosaurs occur, the last being especially abundant. The *Chelonias*, although known from the Jurassic of Europe, here appear for the first time in American rocks. Some of the earliest forms are allied to the modern genus *Trionyx*. In the higher Cretaceous beds, some *Chelonians* of enormous size have been found. They belong to the genus *Attochelys*, which has the ribs separate, as in the existing *Sphargis*, and presents other embryonic characters. A few genera appear to be related to the modern genus *Chelone*. The remaining Cretaceous species were mostly of the Emydoid type; and others were related to *Chelydra*. The more important genera of Cretaceous *Chelonians* known from characteristic specimens are *Atlantochelys* (*Protoschelys*), *Adocus*, *Bathremys*, *Compsemys*, *Platemoschus*, *Osteosaurus*, *Propleura*, *Eglogloma*, and *Taphrosphys*. Most of these genera were represented by several species, and the individuals were numerous. No land Tortoises have as yet been found in this formation. In American Tertiary deposits, *Chelonians* are abundant, especially in the fresh-water beds. They all show near affinities with modern types, and most of them can be referred to existing genera. In the Tertiary lake-basins of the West, land Tortoises are very numerous, and with them are many fresh-water forms of *Trionyx* and allied genera.

A striking feature of the American Cretaceous fauna, as contrasted with that of Europe, is the almost entire absence in our strata of species of *Ichthyosaurus* and *Plesiosaurus*, which abound in many other regions, but here seem to be replaced by the Mosasaurs. A few fragmentary remains have indeed been referred to these genera, but the determination may fairly be questioned. This is more than true of the proposed new order *Streptosaurus*, which was founded wholly on error. The order *Plesiosaurus*, however, is well represented, but mainly by forms more nearly related to the genus *Plesiosaurus* than to the type of the group. These were marine reptiles, all of large size, while some of them attained vast dimensions. So far as at present identified, they may be referred to the genera, *Cinobiosaurus*, *Discosaurus* (*Elaemosaurus*), and *Plesiosaurus*. The number of species is comparatively few, and none are known above the Cretaceous. The important suggestion of Gegenbaur, that the *Ichthyosaurs*, which include the *Plesiosaurs*, branched off from the Fishes, before the Amphibians, finds some support in American specimens recently discovered.

The Reptiles most characteristic of our American Cretaceous strata are the *Mosasaurs*, a group with a few representatives in other parts of the world. In our Cretaceous series, they ruled supreme, as their numbers, size, and carnivorous habits, enabled them to easily vanquish all rivals. Some were at least sixty feet in length, and the smallest ten or twelve. In the inland Cretaceous sea from which the Rocky Mountains were beginning to emerge, these ancient "Sea Serpents" abounded; and many were entombed in its muddy bottom. On one occasion as I rode through a valley washed out of this old ocean bed, I saw no less than seven different skeletons of these monsters in sight at once. The *Mosasaurs* were essentially swimming Lizards, with four well developed paddles, and they have little affinity with modern serpents, to which they had been compared. The species are quite numerous, but they belong to comparatively few genera, of which *Mosasaurus*, *Tylosaurus*, *Leptosaurus* and *Edestosaurus* have alone been identified with certainty. The genus *Mosasaurus* was first found in Europe. All the known species of the group are Cretaceous.

The *Crocodylia* are abundant in rocks of Cretaceous age in America, and two distinct types are represented. The older type, which is foreshadowed by *Belodon* of the Trias, has biconcave vertebrae, and shows marked affinities with the genus *Telosaurus*, from the Jura of Europe. The best known genus is *Hyposaurus*, of which there are several species, all more or less resembling in form the modern Gavial of the Ganges. A peculiar intermediate form is seen in *Dipsosaurus*, from the Wealden of the Rocky Mountains. The second type, which now makes its appearance for the first time, has procaval vertebrae, and in other respects resembles existing Crocodiles. The genera described are *Bolitosaurus*, *Holops* and *Tharosaurus*, none of which, so far as known, pass above the Cretaceous. Of *Crocodylia* with opisthoccal vertebrae, America, so far as we know, has none. Specimens similar to those so termed in Europe are not uncommon here, but they pertain to Dinosaurs. In the Eocene fresh-water beds of the West, *Crocodylians* are especially abundant, and all, with the exception of *Limnosaurus*, belong apparently to the genus *Crocodylus*, although some species show certain points of resemblance to existing Alligators. The Miocene lake-basins of the same region contain no remains of Crocodiles, so far as known, and the Pliocene deposits have afforded only a single species. The Tertiary marine beds of the Atlantic Coast contain comparatively few *Crocodylian* remains, and all are of modern types; the genus *Gavialis* having one Eocene species, and the Alligator being represented only in the latest deposits.

It is worthy of special mention in this connection, that no true *Lacertiles*, or Lizards, and no *Ophidians*, or Serpents, have yet been detected in American Cretaceous beds; although their remains, if present, would hardly have escaped observation in the regions explored. The former will doubtless be found, as several species occur in the Mesozoic of Europe; and perhaps the latter, although the Ophidians are apparently a more modern type. In the Eocene lake-basins of Western America, remains of Lizards are very numerous, and indicate species much larger than any existing to-day. Some of these, the *Glyptosaurus*, were protected by a highly ornamented bony coat of mail, and others were covered with scales like recent Lizards. A few resembled, in their more important characters, the modern Iguana. The genus best represented in the Eocene is, *Glyptosaurus*, *Iguanasaurus*, *Oreosaurus*, *Thinosaurus*, *Pinosaurus* and *Santia*. Some of these genera appear to have continued into the Miocene, but here, as well as in the Pliocene, few remains of this group have been found. It is not improbable that some of our extinct reptiles may prove to belong to *Rhynchocephala*, but at present this is uncertain. The genus *Urolophosaurus*, from Brazil, has biconcave vertebrae, and some other characters which point to that group. No *Dicynodonts* or *Theriodonts* have as yet been found in this country.

The first American Serpents, so far as now known, appear in the Eocene, which contains also the oldest European species. On the Atlantic border, the genus *Tritonophis* (*Phinophis*) is represented by several species of large size, one at least thirty feet in length, and all doubtless inhabitants of the sea. In the

\* Delivered before the American Association for the Advancement of Science, at Nashville, Tenn., Aug 31, 1871.

fresh-water Western Eocene, remains of snakes are abundant, but all are of moderate size. The largest of these were related to the modern Boa Constrictors. The genera described are *Stenurus*, *Lithophis* and *Linnophis*. The Miocene and Pliocene snakes from the same region are known only from a few fragmentary remains.

The *Pterosauria*, or flying lizards, are among the most interesting reptiles of Mesozoic time, and many of them left their remains in the soft sediment of our inland Cretaceous sea. These were veritable Dragons, having a spread of wings of from ten to twenty-five feet. They differed essentially from the smaller Pterodactyls found in the old world, in the entire absence of teeth, showing in this respect a resemblance to modern birds; and they possess other distinctive characters. They have therefore been placed in a new order, *Pteranodontia*, from the typical genus *Pteranodon*, of which five species are known. The only other genus is *Nyctosaurus*, represented by a single species. All the specimens yet found are from essentially the same horizon in the Chalk of Kansas. The report of discovery of remains of this order from older formations in this country is without foundation.

The strange reptiles known as *Dinosauria*, which, as we have seen were numerous during the deposition of our Triassic shales and sandstones, have not yet been found in American Jurassic, but were well represented here throughout the Cretaceous, and at its close became extinct. These animals possess a peculiar interest to the anatomist, since, although reptilian in all their main characters, they show clear affinities with the Birds, and have some features which may point to Mammals. The Cretaceous Dinosaurs were all of large size, and most of them walked on the hind feet alone, like modern Struthious birds. Two well marked types may be distinguished among the remains discovered in deposits of this age: the herbivorous forms, represented mainly by *Hadrosaurus*, a near ally of the *Iguanodon* of Europe; and their carnivorous enemies, of which *Dryopsaurus* (*Laelaps*) may be considered typical in this country, and *Megalosaurus* in Europe. Near the base of our Cretaceous formation, in beds which I regard as the equivalent of the European Wealden, the most gigantic forms of this order yet discovered have recently been brought to light. One of these monsters (*Titanosaurus montanus*), from Colorado, is by far the largest land animal yet discovered; its dimensions being greater than was supposed possible, in an animal that lived and moved upon the land. It was some fifty or sixty feet in length, and when erect, at least thirty feet in height. It doubtless fed upon the foliage of the mountain forests, portions of which are preserved with its remains. With *Titanosaurus*, the bones of smaller Dinosaurs, as well as those of Crocodiles and Turtles, are not uncommon. The recent discovery of these interesting remains, many and various, in strata that had long been pronounced by professional explorers barren of vertebrate fossils, should teach caution to those who decline to accept the imperfection of our knowledge to day as a fair plea for the supposed absence of intermediate forms.

In the marine Cretaceous beds of the West, only a single Dinosaur (*Hadrosaurus agilis*), has been found but in the higher fresh-water beds, which mark the close of this formation, their remains are numerous, and indicate several well marked species, if not genera. In the marine beds on the Atlantic Coast, the bones of Dinosaurs are frequently met with, and in the Upper Cretaceous Green-sand of New Jersey, the type specimens of *Hadrosaurus* and *Dryopsaurus* were found. In Cretaceous fresh-water deposits on the coast of Brazil, remains of this order occur, but the specimens hitherto discovered are not sufficiently characteristic for accurate determination. This is unfortunately true of many Dinosaurian fossils from North America, but the great number of these reptiles which lived here during the Cretaceous period promises many future discoveries, and substantial additions to our present knowledge of the group.

The first appearance of Birds in America, according to our present knowledge, was during the Cretaceous period, although many announcements have been made of their existence in preceding epochs. The evidence of their presence in the Trias, based on footprints and other impressions, is, at present, as we have seen, without value; although we may confidently await their discovery there, if not in older formations. *Archopteryx*, from the European Jura, the oldest bird known, and now fortunately represented by more than a single specimen, clearly indicates a much higher antiquity for the class. The earliest American forms, at present known, are the *Odonotornithes*, or Birds with teeth, which have been exhumed within the last few years, from the Chalk of Kansas. The two genera, *Hesperornis* and *Icthyornis*, are types of distinct orders, and differ from each other and from *Archopteryx* much more than do any existing birds among themselves; thus showing that Birds are now a closed type, and that the key to the history of the class must be sought for in the distant past.

In *Hesperornis*, we have a large aquatic bird, nearly six feet in length, with a strange combination of characters. The jaws are provided with teeth, set in grooves; the wings were rudimentary and useless, while the legs were very similar to those of modern diving birds. This last feature was merely an adaptation, as the more important characters are Struthious, showing that *Hesperornis* was essentially a carnivorous swimming Ostrich. *Icthyornis*, a small flying bird, was stranger still, as the teeth were in sockets, and the vertebrae biconcave, as in Fishes and a few Reptiles. *Apatornis* and other allied forms occur in the same beds, and probably all were provided with teeth. It is strange that the companions of these ancient toothed birds should have been Pterodactyls without teeth. In the later Cretaceous beds of the Atlantic coast various remains of aquatic birds have been found, but all are apparently distinct from those of the West. The known genera of American Cretaceous birds are: *Apatornis*, *Icthyornis*, *Graculornis*, *Hesperornis*, *Icthyornis*, *Laornis*, *Leontornis*, *Paleotringa* and *Telmatornis*. These are represented by some twenty species. In Europe but two species of Cretaceous birds are known, and both are based upon fragmentary specimens.

During the Tertiary Period Birds were numerous in this country, and all yet discovered appear to have belonged to modern types. The Eocene species described are mostly wading birds, but here, and in the later Tertiary deposits, some characteristic American forms make their appearance, strongly foreshadowing our present avian fauna. The extinct genera are the Eocene *Urotrornis*, related to the Woodpeckers, and *Alatornis*, which includes several species of Waders. Among the existing genera found in our Tertiary beds are: *Aquila*, *Bubo*, *Meleagris*, *Grus*, *Graculus*, *Puffinus* and *Urotrornis*. The Great Auk (*Alca impennis*), which was once very abundant on our Northern Coast, has become extinct within a few years.

In this brief summary of the past life of Reptiles and Birds in America, I have endeavored to exclude doubtful forms, and those very imperfectly known, preferring to present the con-

clusions reached by careful study, incomplete though they be, rather than weary you with a descriptive catalogue of all the fossils to which names have been applied. Even this condensed review can hardly fail to give you some conception of the wealth of our continent in the extinct forms of these groups, and thus to suggest what its actual life must have been.

Although the Trias offers at present the first unquestioned evidence of true Reptiles, we certainly should not be justified in supposing for a moment that older forms did not exist. So, too, in considering the different groups of Reptiles, which seem to make their first appearance at certain horizons, flourish for a time; and then decline, or disappear, every day brings evidence to show that they are but fragments of the unraveled strands which converge in the past to form the mystic cord uniting all life. If the attempt is made to follow back any single thread, and thus trace the lineage of a group, we are met by difficulties which the science of to-day can only partially remove. And yet the anatomist constantly sees in the fragments which he studies hints of relationship which are to him sure prophecies of future discoveries.

The genealogy of the *Chelonina* is at present unknown, and our American extinct forms, so far as we now have them, throw little light on their ancestry. This is essentially true, also, of our *Plesiosaurs*, *Lacertilla* and *Ophidia*, although suggestive facts are not wanting to indicate possible lines of descent. With the *Crocodylia*, however, the case seems to be different, and Huxley has clearly pointed out the path for investigation. It is probable that material already exists in our museum for tracing the group through several important steps in its development. We have already seen that the modern procelian type of this order goes back only to the Upper Cretaceous, while the *Belodonts* of our Triassic rocks, with their biconcave vertebrae, are the oldest known Crocodylians. Our Jurassic, unfortunately, throws but little light on the intermediate forms, but we know that the line was continued, as it was in the old world through *Telosaurus*. The beds of the Rocky Mountain Wealden have just furnished us with a genuine "missing link," a saurian (*Diplosaurus*) with essentially the skull and teeth of a modern Crocodile, and the vertebrae of its predecessor from the Trias. This peculiar reptile clearly represents an important stage in the progressive series, and evidently one soon after the separation of the Crocodile branch from the main stem. The modern Gavial type appears to have been developed about the same time, as the form was well established in the Upper Cretaceous genus, *Traosaurus*. The Telosaurian group, with biconcave vertebrae, evidently the parent stock of Crocodylians, became extinct with *Hyposaurus* of the same horizon, leaving the Crocodile and Gavial, with their more perfect procelian vertebrae, to contend for the supremacy. In the early Eocene both of these types were abundant, but some of the Crocodyles possessed characters pointing toward the Alligators, which do not appear to have been completely differentiated until later.

Nothing is really known to-day of the early genealogy of the *Pterosauria*, but our American forms, without teeth, are clearly the last stage in their development before this peculiar group became extinct. The oldest European form, *Dimorphodon*, from the Lower Lias, had the entire jaws armed with teeth, and was provided with a long tail. The later genus (*Pterodactylus*) retained the teeth, but had essentially lost the tail; while *Rhamphorhynchus* had retained the elongated tail, but had lost the teeth from the fore part of both jaws. In the genus *Pteranodon* from the American Cretaceous, the teeth are entirely absent, and the tail is a mere rudiment. In the gradual loss of the teeth and tail, these reptiles followed the same path as Birds, and might thus seem to approach them as many have supposed. This resemblance, however, is only a superficial one, as a study of the more important characters of the Pterodactyls shows that they are an aberrant type of Reptiles, totally off the line through which the Birds were developed. The announcement made not long since in Europe, and accepted by some American authors that the *Pterosauria*, in consequence of certain points in their structure, were essentially Birds, is directly disproved by American specimens far more perfect than those on which the conclusion was based.

It is now generally admitted by biologists who have made a study of the vertebrates that Birds have come down to us through the Dinosaurs, and the close affinity of the latter with recent Struthious Birds will hardly be questioned. The case amounts almost to a demonstration, if we compare, with Dinosaurs, their contemporaries, the Mesozoic Birds. The classes of Birds and Reptiles as now living are separated by a gulf so profound that a few years since it was cited by the opponents of evolution as the most important break in the animal series, and one which that doctrine could not bridge over. Since then, as Huxley has clearly shown, this gap has been virtually filled by the discovery of bird-like Reptiles and reptilian Birds. *Compsognathus* and *Archopteryx* of the Old World, and *Icthyornis* and *Hesperornis* of the New, are the stepping stones by which the evolutionist of to-day leads the doubting brother across the shallow remnant of the gulf once thought impassable.

(To be continued.)

#### For Forest and Stream and Rod and Gun. ON THE SAUBLE.

I HAD often heard of the great sport incident to the pursuit and capture of the celebrated grayling, but had looked upon him as a sort of mythological specimen akin to the sea serpent or dolphin of old. I had heard of him as a bold, free biter, gamy as a trout, and of a flavor equal, if not superior, to his speckled congener. Among my acquaintances none had ever seen him, so I could get no light from that source. Taking down my "Fishing Tourist" and "Sportsman's Gazetteer," I gleaned a little information relative to *Thymallus tricolor*. I found that he existed nowhere in America, but in the northern part of the southern peninsula of Michigan, in the Mainstem, AuSable, Muskegon, and a few smaller creeks and rivers. But that was a long way from home, and I never dared hope to match myself against this noble game fish. Be that as it may, when I received an invitation from a friend in Jackson, Mich., to join a party bound for Higgins' Lake and the AuSable River, there to camp, rest, and try the realities of the grayling fishing, I dropped everything, and the 7th of August, 1877, found me en route for Jackson. Arriving at Jackson I found my friend awaiting me. A day of busy packing followed, and we were off via the Jackson,

Lansing and Saginaw and Mackinaw division of the Michigan Central Railway (through the courtesy of the superintendent, we were provided a special car at a merely nominal cost). Our party consisted of about twenty-five ladies and gentlemen, and a merrier company one seldom sees. Give me young married people for real fun.

After leaving Bay City we were soon in the pine woods; past saw mills, lumber piles and rats of logs we sped, getting occasional glimpses of burned tracts, where charred and blackened tree-trunks, standing naked and desolate, gave token of the terrible work of recent forest fires. The smoke hung in thick masses ahead of us, and soon we were plunging through a tract of burning woodland. The heat was intense; windows were dropped, and the curious who stood on the platform were only too glad to retreat within the cars. This was soon passed, and, emerging into the pleasant sunlight, the ladies insisted upon a ride on the pilot. In vain anxious young husbands dilated on the folly and danger incident to such a proceeding. So, under the careful guidance of the conductor, they enjoyed this novel way of riding, and with the exception of dishevelled tresses, an occasional grease spot and an uncomfortable ringing in the head, were none the worse for the experience.

Eighty-six miles from Bay City the station of Pere Choney was reached. Here we were, indeed, in the heart of the wilderness. Long reaches of pine woods stretched away in every direction, the home of the deer and the bear. Our snorting, panting locomotive loomed strangely out of place in the midst of this primeval solitude.

Choney's consists of two hotels, a large saw-mill, a school house, a country store, and a number of dwelling houses. The place is new and situated on a gentle elevation, with pure, balsamic air. After an early supper we started in lumber wagons for Higgins' Lake, eight miles distant, arriving there at dusk. This is a lovely sheet of water seven miles in length by four in width, and is hemmed in on all sides by forests. Deer are plenty, and numbers of them are shot by fire hunting from a boat, as they come down to the lake to drink or to escape the torment of the fires. The lake strongly recommends itself to pleasure seekers and persons in quest of health. Its merits are complete isolation, fine springs, good perch and bass fishing, natural advantages for bathing, the water being perfectly clear and pure, while the bottom is the whitest sand. It is also safe for ladies and children to boat upon, being shallow for forty rods from shore. The balsamic odor of the pines and spruces, which one inhales at every respiration, is of great benefit to those suffering from pulmonary difficulties; and all through these extensive pinceries may be found consumptives deriving benefit from this life-impregnated air.

A few happy days at Camp Jackson sufficed for W. and I, and so bidding the friends good-by one fine morning, we were off for the AuSable—or, in the vernacular, Sauble. Retracing our old route through the forest we arrived at the station at noon, whence we again took the road which intersects the State road, seventeen miles from Choney's. This latter crosses the peninsula east and west, from Lakes Michigan to Huron. Choney's is undoubtedly the centre of all that region, taking in parts of Crawford and Roscommon counties, and will, I think, in time, become an important point of Michigan.

After a ten-mile drive over a gently rolling country, varied by alternate patches of woodland and open, we arrived at the cabin on the bank of the AuSable, erected by Mr. Cheney for the accommodation of sportsmen. Here we were left in charge of that prince of guides and polemen, Mr. John Jenkins, called for short, Jack; and right here let me say to any one who contemplates visiting the AuSable for fishing or hunting, that Jack's cabin is situated in the midst of the best grayling ground on the river, and near some of the best cross-ways for deer. Jack himself is a skillful poleman, hunter and cook; has a good dry cabin with comfortable bunks, staunch, well-made boats, and, best of all, he is not afraid of a wetting. This last is a great accomplishment for an AuSable poleman, for when the boat, in shooting a rapids, becomes a trifle unmanageable, the alternative is for one to get out and draw the boat from the suction, or for all to get wet. Jack boasts that he "never ducked a man yet;" and with him to detach, you will seldom lose a leader.

The AuSable at our cabin is a stream of perhaps thirty yards in width and averaging from one to six feet in depth, with a current like a mill race. Rapid follows rapid in quick succession, varied by an occasional swirling eddy where perhaps a fallen tree lies just far enough beneath the surface to show the jagged crests of its gnarled branches above the water, rising like a bristling *cheveau de frise*. It takes a quick and dextrous hand at the setting pole to pass these unscathed. I remember noticing a boat wedged tightly under one of these snags, where some poor *voyageur* had been spilled.

W. and I seated ourselves in the bow with rods, pipes and tobacco, and straw hats stuck full of flies, while Jack occupied the stern with setting pole and anchor, ready to land fish, adjust flies, impale hoppers or get out and wade, if such a thing need be to prevent a swamp. Pushing out into the current we were soon gliding down the river, when the rattling of the anchor chain and an admonitory "Now, boys!" from Jack, warned us that the time for our first cast had come. With a brown hackle and a snell baited with a kicking hopper whipped on our leaders, we cast. A rise, a strike, a little jerk to fasten him as we do the trout in New York, you know, and he was off; another and another cast, but with the same result. A few words of advice from Jack and we tried again. This time we had him sure, for by simply holding the rod stiff he firmly hooked himself the instant he struck the fly. How he did fight! How our reel did buzz and our nine-ounce rod bend under that frantic tugging! We were sure, as we played him back and forth, that he would go fifteen inches, but when we reeled him in all tired and submissive, and Jack lifted him out, imagine our surprise to find a fish only about eight inches in length.

Having learned the lesson we profited by it, and soon the well—a compartment in the centre of the boat having a hole in the bottom to let in the water—was a pretty sight. I never enjoyed such fishing; it was the acme of refined sport and equal to trout fishing every wail.

During our forenoon's fishing W. and I simultaneously got heavy strikes. So well did our captives use their "crowning glories" (dorsal fins) that against the heavy current we could hardly budge them. After playing them in the usual manner we reeled them in, when a cry from Jack, "You have both got dubs (doublets)," explained the heavy pull, and we each drew in a ten and a twelve inch grayling, both flies and grass-hoppers having been seized at the same instant.

So we angled until 3 p. m., and then came back to camp highly pleased with our first day's work among the grayling.

Thus the happy days passed on; we were always successful and the sport never cloyed. So when we bid Jack and the little log cabin on the banks of the AuSable farewell, and

rode through the quiet moonlit woods to Cheney's Station, it was with a feeling of regret and a firm resolve to repeat the trip, if possible, another year.

I found the most killing fly for August a brown hackle; but anything not too gaudy will do very well. To illustrate: Jack used a tuft of hair from the back of a "yaller dog," ornamented with a slip of sprucehen feather to take off the curse, and it proved very taking. Grasshoppers abound along the banks and are about equal to a fly as a successful lure. I would advise a light, single-handed rod a trifle stiffer than the ordinary trout rod. Stranger, don't imagine you will find any worms up there; there are none smaller than a massassager, and these are awful scarce, but very taking when you find them.

In all the accounts that have ever come under my notice relative to grayling angling, the advice is to proceed exactly the same as in trout fishing; but experience has taught me that in several essential points the method differs. Every fisherman knows that early morning and late in the afternoon is the time for trout. Not so with the grayling. In August 9 A. M. is early enough and 10 better. Then the small fish begin to rise, the larger ones coming later as the day wears on, until between twelve and one the largest are biting, and the sport is at its height. Again, when a trout takes the fly or bait, owing to the hardness of his mouth, it is necessary to strike him hard with a turn of the wrist to fasten the hook. On the contrary, when the grayling, whose mouth is small, tender and sensitive, strikes the fly, he is fairly hooked. Then keep a gentle strain on, never letting up or allowing any slack until the landing net is under him. It is better to fish down stream, whether in a boat or wading, as in the rapid current of the Au Sable it allows of a better cast. The grayling is not so wary as the trout—the little disturbance one makes in wading or poling amounts to nothing. A good trout fisherman, unacquainted with the habits of the grayling and attempting to fish in the Au Sable, would err in his selection of the favorable spots for a cast. I found by experience that the deep shady pools and whirling eddies were not the haunts of the grayling, but in the rapids and long sunny reaches of semi-rapid water, there he may lie ready to take the tempting lure.

The most effectual way when one wishes to kill a large number of fish is to wade, but it is hard work and wet work; and, as you have no earthly use for more than you can eat, and have no way to keep them alive as you do when fishing from a boat, the latter way is far preferable.

Eastern sportsmen desiring to take this trip will find August the best month for grayling. Take Great Western Railway to Detroit, Michigan Central to Bay City, thence north eighty-six miles by Mackinaw Division Michigan Central Railway to Cheney's, where you will find Mr. Cheney always ready with teams to take you to the river, and at the cabin door Mr. John Jenkins will stand with open arms and a fried grayling. Both these gentlemen are very moderate in their charges, and a fortnight may here be enjoyed that will beat all past experiences in fishing. Deer are very plenty along the Au Sable, and in season much sport may be had in their pursuit. Jack has a good dog and knows all the runways, and many a tale did he unfold to our admiring ears of how he shot this or that buck. There are a few mosquitoes and punkies along the river, but not enough to inconvenience one. Write to G. M. Cheney, Pere Cheney, Crawford Co., Mich., or John Jenkins, Esq., same address, for all information, and when you go, you are sure of game and fish in abundance and a jolly good time. H. W. D. L.

#### THE DUCK PASSES OF SHAKOPEE.

OF the many "passes," the largest one in point of game, known as the "Big Fly," is situated about three miles below the city of Shakopee, on the north side of the Minnesota River, and is easy of access by either land or water. It is a narrow neck of meadow bottom, dry at all times in the ducking season, and situated between two very long rice lakes. The grass on this meadow is cut in due season and stacked on the highest ridges or near a creek—Murphy's creek coming out of the easterly end of the westward lake. These haystacks generally serve the duck hunter as blinds or shelter.

About the latter part of September and through October the feathered game occupy these rice lakes in large numbers, passing over this strip of land from one to the other, in almost continual flight. On Saturday evenings when the railroad shops and foundries are closed, this pass is well occupied by machinists and laborers, who keep up a continuous fusillade until dark, that would almost lead a stranger to believe that the Chippeway and Sioux Indians were fighting another battle on this, their historic ground. Their last engagement on this ground was some fifteen years ago, when a large number of either tribe was wiped out. Quite a number of citizens witnessed this frightful butchery, even contributing powder and ball to the Sioux and taking care of their wounded. To describe the flight of ducks on a cloudy evening during the latter part of October, when they gather together in great numbers preparing to leave for a warmer climate, would be something beyond the power of my pen; it is simply immense. Thousands of birds are on the wing, flying mostly in an easterly direction; and later, as the day-light begins to fade into the gray of the evening, one would think from the terrific flights that the birds were aiming at the hunters' heads, for often we have to "duck" our heads to escape being knocked over. Standing near the west end of the eastern lake, the ducks begin to drop in their flight, frequently flying so low that the dogs bound into the air to catch the birds. Every one who has spent an evening at this pass has expressed astonishment at the number of ducks on the wing, which in appearance resemble rather the flight of wild pigeons. I have shot on this pass for five years, and have bagged as many as thirty-seven black-headed ducks in an hour. Very often we get a good flight of mallards mixed with spoon bills, and it is the sportsman's delight to bring to the ground these fat and plump birds; sometimes they fall so hard that they rebound many feet in the air.

Sportsmen from St. Paul, who frequent these passes, often fill a light buggy box full of ducks in a couple of hours' shooting. But the most successful days are when the Indians are on the lakes with their canoes, gathering rice or shooting, for

then the birds keep up a continual flight, and, in their confusion, huddle so closely together that it seems almost murder to shoot them.

Occasionally a good flight of geese and brant is seen also a species of duck which is here called the "canvas back," as it resembles that famous Chesapeake duck in all but the bill, which is narrow and of a grayish color.

Stemmer's Pass is next best to the Big Fly, and is situated about five miles below the city, on the same side of the river with it and in close proximity to the Bloomington Crossing—a flag station on the St. P. and S. C. R. R.—and is in high favor with the St. Paul sportsmen, as it is easy of access from the city by a good road over the level prairie. This pass is named after the owner of the premises, a very kind old Deutscher gentleman, who delights to entertain visitors, and throws his shooting grounds open to all comers.

The next in prominence are the famous Bloomington Lake passes, eight miles distant and reaching as far down as Hamilton Station; and, last, but not least, is the Little Fly, within a mile and a half from our city, on the north side of the river. Many of our citizens frequent this place on account of its close proximity to town, and a great many birds are bagged on favorable evenings, and he that has a staunch retriever obtains the greatest number of birds, as they usually fall into places inaccessible to man. The prospect for shooting this season is excellent, as we have had an almost continual drought, drying up all the smaller lakes and ponds—except those mentioned which are fed from innumerable springs situated at the foot of the Eden Prairie ridge. Ducks of all descriptions have been hatched here in large numbers, and the shooting season will open in a few days. The season for prairie chickens is in full blast, and carloads go by here on both the railroads coming from the Glencoe prairies by way of the Hastings & Dacotah R. R., and the big western prairies near St. James and Maderia on the St. P. & S. C. R. R. A couple of St. Paul sporting gentlemen were shooting on this latter road as far as Iowa lately, and attempted to ship their birds—some 275 in number—across the State line into our State, contrary to the statutes made and provided, and against the peace and dignity of the State of Iowa, which prohibits said shipment except at the rate of five dollars for each and every bird so shipped. They compromised the matter for a round thousand dollars. Shakopee, Minn., Aug. 23, 1877.

RUSTICS.

#### SPLIT BAMBOO RODS.

To Our Customers and the Public: In reply to the damaging reports which have been circulated respecting the quality of our split bamboo rods, by "dealers" who are unable to compete with us at our reduced prices, we have issued a circular which we shall be pleased to mail to any address, proving the falsity of their assertions.

—[Ado.]

CONROY, BISSETT & MALLESON,  
Manufacturers, 65 Fulton Street, N. Y.

#### Fish Culture.

✕ LETTER FROM SETH GREEN.—Rochester, Aug. 29.—I wish to caution people against drawing off old mill ponds during warm weather, or at any other time, unless they draw them off very slowly. If the gates are hoisted and the water comes down with a rush, it will kill all the fish for a half mile down the stream. It stirs up all the old decayed stuff in the stream, and is death to everything in the water below for a long distance. Last week the State Ponds at Caledonia came near losing all their breeding fish. The head of the stream is about one mile above the ponds. Half of the water comes out of the ground at the head of the stream and a dam was put across the creek, sixty years ago, about forty rods from the spring, making a pond of several acres. It is full of moss and all sorts of animalcules. Last week, the owner of the pond opened the gates and let the water down with a rush. It killed all the trout in the stream for a half mile below, and if it had not been for many large springs coming in on both sides of the creek, all the trout in the stream and ponds would have been killed; and it would take many years to restock the ponds as they are now. We have a large stock of brook trout that we use for breeders for stocking the waters of this State. We have the following kinds that we have raised from the egg: A great many salmon trout, some of them weighing nine pounds; we have a large number of California salmon, from one to three years old—the largest weighing one pound; Kennebec salmon from one to five years old, the largest weighing two and one-half pounds; California brook trout, two years old, the largest weighing one-half pound. We have grayling two years old, of our own raising, that are one foot long. We have a hybrid, a cross between the California salmon and brook trout, which is one and a half years old, and five inches long. We have also a cross between a salmon trout and a whitefish. We have eighteen ponds well filled with the above different kinds of fish, besides many boxes and troughs filled with the young. SETH GREEN.

WHAT'S IN AN OYSTER.—Apropos of the advent of the oyster, the Cape Ann *Advertiser* has been looking at our gustatory friend through a microscope:

Open an oyster, retain the liquor in the lower or deep shell, and if viewed through a microscope, it will be found to contain multitudes of small oysters, covered with shells and swimming nimbly about—one hundred and twenty of which extend but an inch. Besides these oysters, the liquor contains a variety of animalcules and pyramids of three distinct species of parasites. Sometimes their light represents a bluish star about the centre of the shell, which will be beautifully luminous in a dark room.

CALIFORNIA SHAD.—The waters of California were stocked with shad by Seth Green in 1871. The law prohibiting their capture expires the 3d of next December, and there is every indication that there will be a very large return for the outlay incurred on their introduction. Many shad have been accidentally taken in salmon traps and nets, the number thus captured being estimated as more than a thousand. The California Fish Commissioners have requested of Prof. Baird another consignment of 100,000 to be sent at the expense of the State.

✕

MANCHESTER, N. H., Sept. 1, 1877.

EDITOR FOREST AND STREAM:

Illness has prevented me for a month from writing you a short sketch of the progress of fish culture in New Hampshire, and I fear my notes may be some of them stale, but they may be of interest to some of your readers. On the 16th of July my colleague Powers and I, accompanied by Mr. E. B. Hodge of Plymouth, N. H., visited the hatching pond of Mr. Tomkinson, at Livermore's Falls, on the Pemigewasset, about four miles above Plymouth, to ascertain if it would be a suitable site for a State Hatching House for salmon, the Legislature at its late session having made an appropriation of \$1,000 for building such a house, and the Mass. Commissioners having agreed to join us in the matter and bear half the expenses, for the purpose of restocking the Merrimac and Connecticut rivers with this noble fish. We had also another object in view, viz., to ascertain the presence of the young salmon placed in the river in the summer of '76, from the Penobscot ova obtained in the autumn of '75. This was soon decided, as it took Mr. Hodge but a very short time to land half a dozen lively young fellows between four and five inches long, and one or two somewhat longer, who were soon returned uninjured to the river and sent off rejoicing. The next day Powers went with me up the B. C. & M. R. R. thirty miles to Warren, on the Bakus River branch, where he soon established the fact that, as the boys say, "the river was full of them." We also looked at some springs there, but decided that Livermore's Falls was the better place, and on the 7th of August Messrs. Powers and Hayes, accompanied by Commissioners Brackett and French, of Mass., visited the spot, confirmed our decision, and secured on favorable terms from Mr. Tomkinson, a ten-years' lease of the Springs with all the necessary land for the hatching house, pond, etc., etc., and contracted for the immediate erection of a hatching house, so as to use it this autumn for hatching 400,000 California Salmon, which Prof. Baird has kindly promised to the two States of Massachusetts and New Hampshire, and 20,000 land locked salmon which we also expect from Maine through his kindness. We shall also follow Seth Green's example, and hatch all the brook trout we can for distribution to our sadly depleted streams, which ignorant selfish fellows calling themselves sportsmen are fast depopulating. What do you say to Mr. Hodge's solemn statement that he weighed a basket of 200 trout brought in to Plymouth this summer, and found the weight just three pounds! Had there been eight less of them, or 192 trout, they would have scaled just  $\frac{1}{2}$  ounce each! Do you wonder that our streams are cleaned out?

We propose to give our whole attention to the Merrimac River at present, until the fishways at Holyoke and Turners Falls are made passable. The Holyoke fishway is a failure, because its mouth is too far down stream where the fish cannot find it, and it has got to be cut off in the middle and bent back to the foot of the dam—as has been done at Lawrence—before it will be of any use. The Lawrence fishway is all right, and by enlarging the openings of the Foster fishway at Amoskeag Falls, we have made it passable so that many large salmon have been seen this summer away up in the Pemigewasset. A friend of mine saw five lying side by side under the bridge at Plymouth, three weeks since, and they have been seen jumping Livermore's Falls, where we propose to put our pond. We shall build a new Brackett fishway at Amoskeag before next season, so as to be as perfect as possible.

Meanwhile we have not been idle in other directions. Messrs. Hays and Powers have transplanted a number of black bass from Sunapee Lake and Wakefield Pond, where they have bred very rapidly, to other waters in the State; and the last week in July Mr. Powers and I took 200,000 shad from Holyoke to the Upper Merrimac in two successive trips, placing 100,000 in the Winnepesaukee River, just above Tilton, and 100,000 in the Contoocook River in Hopkinton with but a very slight loss in transportation. My son, Mr. S. S. Webber, met us at Charlestown, N. H., where he was visiting, with a fresh relay of ice, so that, in spite of the heat, we were able to keep our water at about 67 deg. the whole trip.

We succeeded in getting a commission authorized by the Legislature and appointed by the Governor in July to act with us in preparing a new code of game and fish laws this winter, to be submitted to the next Legislature, and hope to get something nearly right, as the commission are all good sportsmen, while two of them are keen lawyers, and the third is a member of the Governor's council. "So much for Buckingham!"—I have no doubt you will say "Off with this head," for I have spun out my yarn unwittingly.

Yours very truly,

SAM. WEBBER.

NEVADA.—There is great mortality among the fish in the Carson River.

CALIFORNIA.—The Sacramento Fish Commissioners have instituted prosecution against the salmon fishermen for wholesale violation of the fish laws.

## Natural History.

## CRAWFISH.

THE habits of the crawfish (*Astacus*) differ somewhat with the species. For instance, those found in Canada and the Northeastern States (*A. bartonii*) prefer stony brooks, where they love to hide during the day, as I think they are all more or less nocturnal, while the *A. mississippiensis* of the Western States burrows vertically as well as laterally, and builds a cylinder or well on top of the ground, often ten inches high, where it ascends during a rise of the water, which it likes to leave at times. I have seen these mounds or burrows on the rolling prairies of Kansas, five miles from any visible stream; and it is well known to the frontiersmen that in digging a well it is safe to follow a crawfish hole down, as it is believed that they come up from an underground stream or stratum of water, instead of crawling over the prairie and burrowing down. This species is larger than the other, often measuring four and a half inches, while *A. bartonii* seldom if ever exceeds three. They breed much as the lobsters do; *i. e.*, the female carries the eggs in the appendages under her tail until they hatch, but differing from the lobster in the young undergoing no metamorphosis as most other decapods do. The sexes are distinct, and differ in the structure of the abdominal appendages, the first pair being soft in the female, who also has the genital orifices at the basis of the middle pair of legs, while those of the male are at the basis of the last pair. I noticed in some eggs that I hatched this year that the embryo was coiled in the egg with the ventral outward, and the yolk or umbilicus appeared to be behind, but was called away and did not complete the observations, as they were all hatched on returning.

They are great nuisances about fish ponds, especially in clay, where their burrow never closes, but remains a permanent drain. Dams and bridges have been destroyed by their undermining, and why your correspondent wishes to introduce them I do not know, unless for the table. They are good boiled or made into a salad, and I often eat them when opportunity occurs to get a quantity of sufficient size. If this is the object, perhaps the Oregon species (*A. oregonus* or *A. trochiloides*) would be preferable, as they are the largest, I think, of the fresh water forms. One found in the Columbia River is said to have grown to the length of eight inches. They are excellent bait for some fishes—the basses, etc. The name is sometimes spelled crayfish, and, according to Webster, "Is corrupted from O. II. German—*krebis*, now *krebs*; or from French, *crevice*, which is itself derived from *crebis*," and in many places in the interior, notably parts of western New York, Illinois and Indiana, they are locally known as *Dams*. Dams have been successfully protected from them by facing with saw-dust, or, better yet, spent tan bark, which settles down and fills the hole as fast as made.

J. FRED. MATHER.

A WAR WITH BATS.—A curious story comes from Dog Prairie, St. Charles county, concerning the manner in which the house of Mr. T. J. McAtee has recently become infested with bats. McAtee lives in a double log house. His attention was first directed to the neighborhood of his front gate, at which point he heard innumerable flitting noises like a storm in the distance. He saw what at first he took to be a black cloud approaching, but as it got nearer he realized that it was a horde of bats. As the swarm neared the house it lowered, and McAtee instinctively retreated from the formidable enemy, rushed through the front door, closed the shutter and lowered the window sashes. A considerable number found entrance into the room, and McAtee and a hired man succeeded in killing about one hundred. On the outside could be heard a tremendous commotion, as if the bats were swarming and fighting among themselves. McAtee went through the back door into the back yard and around to the south side of the house, where the horde had congregated. The scene at the window is described by him to have been of the most extraordinary character. The air was filled with myriads of bats, flying and circling about in all directions and darting against each other with audible force. A huge and writhing mass had settled on the window sill, and the entire frame as well as the wooden part of the sash was covered with them. The weather boarding for at least five feet on each side of the window and from the lower logs to the top of the house was covered with the black throng. A bright light shone through the window panes and everything on the outside was plainly visible. Though the greater part of the invaders showed a preference for this window, a general inspection showed that they were distributed over the entire premises. Every outhouse on the place was either invaded or surrounded. In the stable, where three horses were munching their evening oats, there was a dread pawing and whinnying, and an examination revealed the fact that every stall and trough was infested with bats, and McAtee deemed it a matter of prudence to turn the horses loose in the pasture. The dogs—of which there were six on the place—went around howling in dismay at the strange spectacle.

Overcome and confused by this phenomenal visitation, McAtee finally conceived a plan which resulted in the capture and death of a very large number of them. The window sash was raised, and thousands rushed in, and in five minutes there was not a vacant spot on ceiling, wall, floor, table, bedpost, bureau or chair. The window was then closed, and McAtee and his hired man began the work of destruction. The two men were armed with ax helves, and they made fearful havoc among the foe. The slaughter continued an hour and a half. The result, by actual count, was 4,103 dead bats, and their carcasses filled a large barrel which holds over five bushels. Though this onslaught greatly diminished the number of invaders there were still hundreds, and perhaps thousands, of them left, though, owing to the darkness, it was found impracticable to make further war on them. Next morning when McAtee awoke not a bat was to be seen, all the survivors having disappeared as mysteriously as they came.

It seems, however, that the bats were determined to make McAtee's house their haunt, and the following night they swarmed as formidably as on their first visit, and over three thousand were killed. They still persist in coming, and up to this time there have been upward of seventeen thousand slain, and, though there is a visible and gratifying falling off in the number of invaders, they yet infest the premises in sufficient numbers to be very troublesome. It is believed that they come from an immense thicket about ten miles up the Missouri River, where they breed in countless quantities. It is known that this thicket or swamp is thickly infested with them, and still hunters have often found them so numerous in certain spots that they could not make headway without great annoyance. McAtee considers the visitation a serious calamity, and is carrying on a relentless war of extermination. The invading bat is of the common insectivorous species, quadrupedal and with a body much like that of a mouse. The story is certainly an extraordinary one, and its truth is vouched for by several reliable witnesses.—*St. Louis Globe Democrat*, Sept. 3.

A JAPANESE IN THE AQUARIUM.—A young Japanese student who has been visiting the New York Aquarium describes his visit in a letter to the *Tokio Times*, July 28. He says:

"But that which interested me personally was the beautiful three-tailed gold fish, solitary, but in his glory, with this label on his tank: 'The three-tailed Kingyo—Japan. Offered \$2,000.' You know what kind I mean. I should think it was a very fine specimen of our Kingyo. Its body was not more than two inches long, and was beautifully colored, white and red; but its tail, in three branches, was near four inches long. Is it strange that I felt a sort of kinship existing between me and this lonely creature on that spot? I was at once reminded of Bayard Taylor's experience with the lion at the Central Park Menagerie. I brought my face close to the tank and whispered in Japanese, 'Ohayau, Mr. Kingyo,' when, lo and behold, Mr. Kingyo made straight to my face, and to me seemed to make signs of recognition at me. Perhaps it was only my nose he recognized, and took it for a remarkably inviting bait; and to say the truth, he did nibble affectionately and most eagerly at that organ through the thick partition of the glass tank."

ORTOLANS.—Your special correspondent, under date, Washington, Aug. 10th, in writing of rail shooting, speaks of those birds as ortolans. Why is this? I have supposed the ortolan (*Emberiza hortulana*) belongs to the Bunting family, and was not aware that this species (ortolan) inhabits this country. As their name indicates, they are not a marsh bird, but whose characteristics are quite the reverse of those of the rail family. If in this, however, I am in error, I shall be glad to be set aright. Again, he says, "Feed birds, unlike the ortolan, seldom penetrate into the interior of this country." I am sure your correspondent, upon further inquiry, will find that they quite commonly penetrate the whole interior of this country. I have seen them upon our Nebraska prairies quite frequently during the past ten or twelve years, and they gather in flocks here before starting South, in autumn—the same as I observed them in Vermont 25 years ago. Yours truly,

Omaha, Aug. 21, 1877.

B. E. B. KENNEDY.

[The above writer evidently confounds the bobolink (*Dolichonyx oryzivorus*) with sora rail, or ortolan (*Porzana carolina*). The sora rail we have frequently met on the prairies of Nebraska.—Ed.]

DO FISHES HEAR?—Apropos of this question, which has already been discussed in *FOREST AND STREAM*, the experience of Mr. Frank Hale, of Pigeon Cove, Mass., is interesting, as told by the *Cape Ann Advertiser*:

Mr. Hale, often visited the brook at the rear of his lot and found that articles of food thrown in were eagerly consumed by some eels that inhabited it. Daily feeding the eels established a friendly acquaintance, so that they in time fed directly out of his hand. Later, the friendship is so cordial on their part, that when he approaches the brook and makes a sort of whistling noise to call them, they swim briskly up from their haunt down stream, come to his hand held in the water, fondle and play lovingly around his fingers, and eat gratefully and very heartily, too, of the fish and mackerel he brings them: one large one, fully two feet long, and very large around and heavy; two smaller ones, who joined the happy family since the old one began the acquaintance; and one a little younger, who has come in only lately. The old one is so sociable that he allows Mr. H. to lift him quite out of the water, play with him, passing his slippery form from hand to hand very freely. How much farther this singular acquaintance may be carried does not yet appear. What subtle link of Darwinian kindred there may be between eels and humans we shall perhaps know by-and-by.

DISGUST.—A writer in the *Revue des Deux Mondes* says that disgust, on ultimate analysis, will be found to be an instinctive sentiment of protection, varying with species, and with the alimentation, habits and education of individuals. It is in consequence of the hereditary instinct which has apprised our ancestors that certain animals and substances might be dangerous for us. He points out that disgust sometimes attaches to the total form of objects, and may diminish and become extinct as scientific analysis disjoins the parts of the repugnant whole. Thus a spider, viewed as a whole, is a repulsive creature; but take a leg or an eye of it and study in the microscope the marvelous arrangement of those organs, and the sight will awaken admiration instead of disgust. Again, habit is evidently an important factor in feelings of disgust. To eat frogs or snails is repugnant to us, yet we eat without disgust such things as black pudding, tripe, liver, high game and decayed cheese. The aversion to horse flesh is not readily accounted for, except by habit.

—Immense flocks of swallows haunt a little copse in West-erly. Hundreds of thousands of these birds gather, filling the air and confusing the mind with their twittering. They come singly, in pairs, by the score, in hundreds, and even in flocks of thousands, until there seems to be no room in the air for more. All at once, as if by magic, they shoot into the copse and disappear. It is really a wonderful sight. Western people visit the place every evening, and many come over even from Watch Hill and Stonington to witness the singular phenomenon. They have been known to gather there for a number of years, but in numbers they excel this year.—*Providence Journal*.

—A French ornithologist has taken the trouble to find out at what hour during the summer the commonest small birds wake up and begin to sing. The result of his inquiry shows that the earliest riser of all is the greenfinch, who tunes up at about half past 1 A. M., some hours before the more robust and melodious species of finches are ready for work. The second to put in an appearance is the blackcap, who is to be heard at half past 2, or thereabouts; and half an hour later the quail makes his first attempt at a musical performance. It is nearly 4 o'clock, and the sun is well above the horizon, before the first real songster appears in the person of the blackbird, who precedes the thrush about half an hour, and the chirp of the robin is about the same length of time before that of the wren. Finally, the house sparrow and the tom tit occupy the last place on the list.

TORTOISES AS WEATHER INDICATORS.—If there be any truth in a paper read by a French savant at a recent meeting of the Academy of Sciences in Paris, every well-regulated household should have one or more tortoises about the premises. According to M. Bouchard, tortoises take extraordinary precautions against cold weather. Their instinct tells them in the milder seasons when the thermometer is likely to fall to freezing point, and toward the end of autumn warns them also of the approach of winter. In both cases they take precaution to screen themselves from cold, and by carefully observing them, M. Bouchard has for years been enabled to regulate his household. At the end of autumn, when the winter threatens to be severe, tortoises creep deep into the earth, so as to completely conceal themselves from view. If, on the contrary, the winter promises to be mild, they scarcely go down an inch or two, just enough to protect the openings of their shells. Last January, which was so mild, they even went about. Last month, the thermometer standing at 50 deg. Fahrenheit, our author saw his tortoises creep into the ground, and that very night the glass fell to 28 deg. Fahrenheit. On the 1st inst., the mercury being at 110 deg. Fahrenheit in the sun, one of the tortoises hid itself; on the following morning there was hoar frost.

—The Mt. Sterling, Pa., *Democrat* says: A large rattlesnake was killed in Breathitt county, a few days ago, that proved to be quite a curiosity. It was perfectly formed, save it had two well-developed necks and heads. The prongs of the necks were about four inches long, and the snake used both heads at the same time, striking with both and thrusting out its tongues in a spiteful manner, and had the appearance of two snakes—so much so that the parties who killed it did not discover the deformity until his snakeship was dead. We give Judge E. C. Strong, of Breathitt, as authority for the above, and he says it can be substantiated by a dozen good witnesses.

—The sea lion in the Coney Island Aquarium was taken sick a few days ago. How to relieve his ailments was a question that puzzled his keeper. The following device was finally adopted: A fresh herring was procured and cleaned, it was then filled with castor oil. When it was thrown into the tank, the sea lion seized and swallowed it in a second, and has recovered his wonted good health, and is now as noisy as ever.

ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDEN DURING WEEK ENDING TUESDAY, SEPT. 4, 1877.—One night heron (*Nycticorax nycticorax*), presented; two ropher tortoises (*Testudo carolina*), presented; one alligator (*A. mississippiensis*), presented; one great horned owl (*Bubo virginianus*), presented; one llama (*Lama peruviana*), born in garden; one diamond rattlesnake (*Crotalus adamanteus*), presented; two chicken snakes (*Ophibolus getulus*), presented; one black snake (*Boscama constrictor*), presented; two glass snakes (*Ophiocercus ventralis*), presented; two alligators (*A. mississippiensis*), purchased; twenty-three gray lizards (*S. undulatus*), purchased; seven chameleons (*A. principalis*), purchased; one whip snake (*M. flagelliformis*), purchased; one green snake (*Cyclophis vernalis*) purchased.

ARTHUR E. BROWN, Gen'l Supt.

ARRIVALS AT PHILADELPHIA ZOOLOGICAL GARDENS FOR WEEK ENDING TUESDAY, SEPT. 11.—One raccoon, *Procyon lotor*, presented; one gray fox, *Vulpes virginianus*, do; three canary birds, presented; two laughing gulls, *Larus atricilla*, presented; one woodchuck, *Arctomys monax*, presented; twenty-four gray lizards, *Scoloporus undulatus*, purchased; fourteen chameleons, *Anolis principalis*, do.

ARTHUR E. BROWN.

—Camp's automatic cartridge loader is an invention that must commend itself to sportsmen. Two receivers are filled, one with powder, the other with shot, and they deliver the charges to each shell as desired, only three motions being required to load. Try it.—[See adv.]

## Woodland, Farm and Garden.

## EFFECTS OF AUTUMN FOLIAGE.

NOW that the season is well advanced, and summer merges into autumn's lap, and the gorgeous fall tints of our trees and shrubs develop more and more every day, it would be well for those interested in beautifying their country homes to study well the effects of this coloring, and, when possible, have their trees so planted in future that a flower garden, as it were, will be presented to the eye long after the flowers themselves have faded. Last season we saw a country seat, planted some years since with special reference to this idea, and now that the selected specimens have grown and rounded the various groups into perfect fullness, the exquisite blending and contrast of colors may well be termed surprisingly beautiful. The scarlet of the Scarlet Oak, the yellow of the Sassafras, the crimson of the Liquid Amber or Gum Tree and Pepperidge, the orange of the Red Maple and Sugar Maple in one group will be, in these later days, almost dazzling, and then to heighten the effect, if that were possible, the American Ivy, with its brilliant festoons of crimson leaves, and the green Briar with its golden-yellow foliage will twine

about and festoon all the undergrowth and branches. This is but one illustration of what has been done, and the grounds which it brightens and beautifies contain many other groupings of similar character. Native plants have not been excluded simply because they fail to possess the merit of rarity, but even the every day and common Sumach is to be seen in groups and singly, wherever its bright scarlet tints can be made tributary to the general effect. Probably no one species presents such a diversity of color as the Red or Swamp Maple (*Acer rubrum*). On one leaf we have before now been able to trace ten distinct colors and shades, and all in such harmonious combinations as to create the impression of a direct and special design. There are also many of our common native shrubs that can be made objects of beauty by the display of a little taste in planting them. As, for instance, the wild Blackberry with the deepest shade of crimson on its autumn foliage. Examples might be multiplied, but enough has been said to illustrate our idea of a neglected phase in landscape adornment. Now is the time to note all the varying tints for more practical use hereafter, and if the subject receive the attention to which its merits entitle it, the time will come when our foreign visitors will have no occasion to repeat what is still a frequent question, "Why do you not make use of the most beautiful feature of your forests?"

We have heard so much of late years of the quantity of plants and flowers used for decoration at some of the large parties and balls given by some of our millionaires, and the following paragraph from the *Gardener's Chronicle*, London, will exemplify how they do it in England:

We are informed that at a ball in Belgrave Square on the 9th ult. Mr. Wills supplied and arranged in one day 59 large Palms, *Dracænas*, etc., from 12 to 20 feet high, including many splendid specimens of *Cocos flexuosa*, 15 feet high; 60 Palms, from 6 to 15 feet high; 188 various Palms and foliage plants, from 4 to 10 feet high; 1 extra large *Scaevola elegans*, 25 feet high; 292 foliage plants and Palms, from 8 to 6 feet high; 10 large *Phormium tenax*, 6 by 10 feet; 107 plants of Wills' new hybrid *Dracænas*, from 3 to 5 feet; 72 large Ferns, from 3 to 7 feet high; 84 *Cyperus*, various, 688 Creeping Jenny (*Lysimachia*), 2,880 *Lycopodium denticulatum*, 84 handsome foliaged *Dezonias*, 209 *Adiantum cuneatum*, 109 *A. farleyense*, 50 *Sedums*, 50 *Panicum variegatum*, 60 large *Ivies* in pots, 10 feet high, 20 *Cocos Weddelliana* for centre of refreshment tables; 1416 choice flowering plants, 150 handsome *Liliums* (specimens), 72 *Crassula coccinea* (specimens), 48 choice *Orchids*, etc., 72 *Isolepis gracilis*, 72 *Tradescantias*, 150 various creeping and trailing plants; total, 7271 plants, 72 spikes-Tuberose, handsome; 6500 cut Roses, *Stephanotis*, cut *Orchids*, etc., 22 tons clear block ice, 5 tons of *Derbyshire spar*, 1 ton of virgin cork bark, 4 vanloads of green moss (equal to 1200 bunches). Large grottos were constructed, water for fountains, waterfalls, etc., laid on. The total cost of the above considerably exceeded £1,000. Thus it will be seen that the cost of such entertainments has been much underrated by the general press. Of the taste and good sense that prompts such lavish expenditure we say nothing.

J. R.—Many thanks. Your asters are very fair, but not up to the mark. They look as if more liberal watering would have improved them.

J. D.—*Dioncea muscipula* (Venus' fly-trap) can be had from any of our principal nurserymen. As it goes to rest in the winter season it will do little good with you till toward spring.

P. W.—The yellow flower is *Solidago altissima*, a very beautiful and striking species. The purple one, *Vernonia novboracensis* or Iron weed, and the pinkish one with the strong camphor scent, *Pleuchea camphorata*, the latter you must have gathered in a salt meadow. Please number them in future.—Ed.]

WESTERN FLORA.—The party of scientists, among whom are Professor Asa Gray, of Harvard College and Sir Joseph D. Hooker, of Europe, who have been making special scientific explorations in Kansas, Colorado, Wyoming and Nevada, have collected over 600 species of plants. The botanical results of the expedition are to be embodied in the report of Professor Hayden's survey.

THE IVY GREEN.—A slip of the English ivy, the original slip of which was taken from off Shakespeare's grave, has been planted before the front wall of the Suffolk, Conn., Episcopal Church.

—The Entomological Commissioners who were sent out West by the Government say there need be no fear of grasshoppers this year.

—There is a sunflower in Adrian, Mich., the stalk of which is 11 feet 8 inches high and 11 inches in circumference, and bears 99 blossoms.—Ed.

—A large mushroom is said to have forced its way through twelve inches of concrete covered with a thick layer of asphalt in the floor of the Savings Bank Department of the General Post Office in London.

—Peck & Snyder have issued a complete Archery Manual, giving full directions as to the use of the long bow, etc. At their house in Nassau street will be found a full line of sporting goods.

## Sea and River Fishing.

### FISH IN SEASON IN SEPTEMBER.

| FRESH WATER.                                 | SALT WATER.                                      |
|--|--|
| Trout, <i>Salmo fontinalis</i> .             | Sea Bass, <i>Sciaenops ocellatus</i> .           |
| Salmon, <i>Salmo salar</i> .                 | Sheepshead, <i>Archosargus probatocephalus</i> . |
| Salmon Trout, <i>Salmo confinis</i> .        | Striped Bass, <i>Morone saxatilis</i> .          |

| Pike or Pickerel, <i>Esox lucius</i> .       | Bonito, <i>Sarda pelamys</i> .                   |
| Yellow Perch, <i>Perca flavescens</i> .      | Kingfish, <i>Menticirrhus nebulosus</i> .        |

FISH IN MARKET.—Owing to the severe storms of the past week, the stalls do not present such an appearance of plenty as marked them a short time ago. Our quotations are:

Striped bass, 18 to 25 cents per pound; smelts, 25 cents; bluefish, 10 cents; salmon, frozen, 30 cents; mackerel, 15 cents; weakfish, 15 cents; Spanish mackerel, 20 cents; green turtle, 15 cents; terrapin, \$15; halibut, 15 cents; haddock, 6 cents; king-fish, 25 cents; codfish, 8 cents; blackfish, 15 cents; flounders, 8 to 10 cents; sea bass, 18 cents; eels, 18 cents; lobsters, 8 cents; scollops, \$1.75 per gal.; soft clams, 30 to 60 cents per 100; Salmon trout, 18 cents; sheepshead, 25 cents; whitefish, 15 cents; hard shell crabs, \$3.50 per 100; soft crabs, \$1.50 per dozen.

Mr. KINCO HOUSE, Moosehead Lake, Sept. 5.—The September fishing provinces to be unusually fine this year. I took four trout in North Bay yesterday, aggregating ten and a half pounds. The Kinco House was never better patronized.

MONSTER TURTLE.—As Dr. Walton and the Rev. Mr. Hazlewood were returning to the city from a yachting cruise, they saw an enormous sea turtle swimming near Naskeag Point. Three men got a rope attached to him, but instead of being able to pull the prize ashore it could easily pull them to the water, and after making their rope fast to a tree they awaited the going down of the tide, which left him high and dry. The doctor made the following measurements. From tip of nose to the tail, 8 feet; between the tips of the flippers, 11 feet; length of shell, 5 feet 7 inches; width of shell, 4 feet 6 inches; length of flipper, 3 feet 6 inches; weight of flippers 40 pounds; weight of head, 25 pounds. The doctor estimates, the total weight at 800 pounds. The turtle proved to be blind, his eyes having been put out with charges of buck-shot, which he had received at some time. The fact of his being blind is supposed to be one of the causes of his straying so far from the usual haunts of turtles of his kind. It is evidently the largest turtle ever captured on the coast of Maine.—*Bangor Whig*.

NEW HAMPSHIRE—White Mountains.—"Josh Billings," who has been a guest at the Glen House this summer has fished every day while there. His catches are large in number—200 one day and 400 another—of weight there is no record.

Ferrisburg, Vt., Sept. 10.—Pike, perch and bass fishing very fair at the present time.

MASSACHUSETTS—New Bedford, Sept. 7.—The bass fishermen have been very successful the past ten days, especially at No Man's Land, where some thirty have been caught, the largest scoring sixty-seven pounds. At Cuttyhunk and south side of Martha's Vineyard also good catches have been reported; fishing at Cuttyhunk has previously been very poor.

CONOMA.

MOVEMENTS OF THE FISHING FLEET.—Recent arrivals from the Bay St. Lawrence report the mackerel fishery a failure there, as well as on our own shores, and some of the vessels had not seen a mackerel for a fortnight before leaving the Bay. The vessels already arrived, representing the portion of the fleet meeting with the best success, report an average catch of 188 bbls., which would not be more than half a fare in ordinary seasons, and will not pay the expenses of the voyage, even at present high prices. Unless the majority of the fleet, still remaining in the Bay, find better fishing this month, which is not deemed probable, most of the vessels will be obliged to return empty, and the mackerel fishery will prove a lamentable failure this season. The Shore fleet are doing nothing of consequence. Sch. Maud Muller met with a streak of luck off Portland a few days since, and took a fare of 170 bbls. mackerel at one haul of the seine, but the rest of the fleet have not been so fortunate, and report mackerel scarce and shy.

The number of fishing arrivals reported at this port the past week has been 69, as follows: Banks, 11, with 600,000 lbs. codfish, 245,000 lbs. halibut; 31 from Georges, with about 375,000 lbs. codfish, 6,000 lbs. halibut; 5 from the Bay St. Lawrence, with 800 bbls. mackerel; 22 from Shore trips, with 600 bbls.

The masters of the vessels returning from the Bay St. Lawrence agree in the opinion that the mackerel have left the Bay and that the fall fishery will be a failure.—*Cape Ann Advertiser*, Sept. 7.

Beach Haven.—Striped bass fishing is to be had here through September. The best time for catching them is during the first two hours of the flood tide. Bait with soft crabs.

Kinsey's Ashley House, Barnegat Inlet, Sept. 8.—Storming past three days—2d, 3d, and 4th. From 50 to 200 bluefish for a day were taken by yachts outside the inlet. One party of ladies and children caught 78 on the 2d in front of the house.

PENNSYLVANIA—Edenburgh.—A. Harris, of New Castle, recently captured a salmon weighing nine pounds eleven ounces. This is the first salmon taken in this vicinity for twelve or fifteen years.

Clearfield, Sept. 8.—Bass fishing is at its height. Famous strings are made by amateurs and experts. The river is still infested with dam builders, who are now, however, likely to come to grief as the Sheriff and District Attorney have taken them in hand.

Phoenixville.—A bass weighing five pounds was recently captured in the Schuylkill.

DELAWARE.—The *Germantown Telegraph* gives welcome news of a new and more expeditious route to the perch fishing grounds of Betterton. Leaving Broad and Prime streets, in the Baltimore Railroad's fine cars at 8 A. M., or 5½ P. M., you get off at Still Pond, which is about six miles from Betterton, where you take a conveyance, which is always to be had, and in an hour you are at Betterton, making 5½ hours in all. There are generally many boats every day on the "fishing ground," but there is room enough and to spare for all. Storms are to be provided against by up anchor and scudding in a bee-line for the shore. Perch are more numerous this season than for several years past.

KENTUCKY—Louisville, Sept. 10.—A party of city anglers are at Kelley's Island, Lake Erie, where bass fishing is reported excellent. Gen. Geo. B. Hodge is spending his vacation, shooting and fishing, at English Lake, Ind. Hal Griswold and Geo. James leave to-morrow for Fourteen-mile creek to spend several days. J. Val Cowling, H. M. Griswold and others will spend six weeks camping on the Kanakee, hunting and fishing. They leave the last of the month. R. M. Cunningham and several other gentlemen left to-day for Lawrence on White River, Indiana, to fish during the week. Fishing is reported excellent there. Mr. J. R. Middleton returned Wednesday from an extensive fishing excursion in Wisconsin. He caught one pickerel that weighed twelve pounds.

DETROIT, Sept. 8.—E. W. Reynolds, Charles Ives, William Radcliff and Robert Baker arrived home on Tuesday last from a ten day cruise at the St. Clair Flats. They had very fair success, getting 103 bass, and 67 pike. On the 3d inst. L. W. Hallock caught 32 black bass and 2 pickerel. The pickerel weighed 12 pounds each. E. O. Dunfee and L. W. Hallock, on Sept. 4, caught 24 black bass; H. D. Potter caught 26 black bass on the 5th inst.; Hon. S. Chandler, Geo. Jerome and Alfred E. Brush caught, on Sept. 6, in one hour, 50 perch, Mr. Brush catching also a ten pound pickerel.

BOVER.

CALIFORNIA, Watsonville.—The citizens of Watsonville to make the Pajaro Valley a favorite resort for hunting and fishing, have organized a Piscicultural Society, and the pretty lakes toward the foothills are to be stocked with fish.

—"Going a fishing" is the Californian editor's way of announcing the suspension of his paper, from and after date.

LABRADOR FISHERIES.—After a scientific exploration of the coast of Labrador by Professor Hind, it was found that the fish on the southern shore of the peninsula have alarmingly decreased in number since 1870, and the result of the salmon, cod, mackerel, and herring fisheries this season fully sustain the Professor's opinion. Immediately on his return to St. John's, N. F., where he was to report to Sir John Glover, the Governor, he published a warning to the merchants and out-fitters of that island, that if they did not employ larger vessels to sail to the extreme northern coast of Labrador, one of their most valuable resources would soon be in a condition of hopeless decay. The extreme northern waters are, according to Hind's report, teeming with fish, which would suffer no perceptible depletion after twenty years' successive fishing; while on the other hand the fishing grounds of the southern coast would recover their ancient yield, if the Colonial Government were to legislate against fishing in that part of Labrador for ten or fifteen years.

HALIFAX, Sept. 9.—The Fishery Commission, it is understood, gave a decision on Friday, previous to adjourning, which completely destroys the idea that the Washington treaty put an end to all disputes relative to the North American fisheries. If the report is correct—and it seems to be well founded—counsel acting for the United States asked the Commissioners to rule that the commission do not consider it within their province to award compensation or take into consideration the advantage to American fishermen of transshipping cargoes, or buying bait, ice, and supplies. Two days were spent in argument of this question, nearly all counsel of both sides taking part. The counsel for Great Britain took strong ground against the propositions. A large part of the British case was devoted to pointing out the advantages to American fishermen of being in a position to purchase bait and supplies, a claim for large compensation being founded thereon. The American counsel contended that the Washington treaty gave no such privileges to their fishermen, and that the present commission should not take them into consideration. The idea of the Americans seems to be that a large number of our people, being interested in trade with American fishermen, will prevent the Dominion Government from interfering with the latter if they can under present laws, or introducing new legislation for such a purpose. The Commissioners gave unanimous decision that they were incompetent to award compensation for transshipment of cargoes in British waters, or for purchase of ice, bait and supplies.

—"Far be it from us to doubt the word of a brother editor," says the *La Crosse Sun*. "We believe them all to be truthful men; but when the *Durand Times* says that the water is so low at the mouth of the Chippewa River that catfish have to employ mud turtles to tow them over the bar, we feel as though the editor must be away, and some local minister filling his place."

—Brandon House, Watterstone & Barton Proprietors, Greenwood Lake, Orange Co., N. Y. Black bass biting well. The cool weather gives excellent opportunities for fishing. Reduced rates; now is the time for sport. Take Montclair and Greenwood Lake Railroad, foot of Desbrosses St.

QUERY.—I like fish stories and have myself caught sharks, and without being captious, and for the purpose of general information, I would like to ask the contributor of "Red Snapper Fishing in the Gulf of Mexico," in Aug. 30th issue, if he intended to infer that the indications of getting the second ten gallons of oil from the one hundred and twenty-five pounds of sharks' liver were real good. Oil weighs about seven pounds per gallon, and that liver was rich in oil and would not leave any scrap.

So long as your correspondent confined himself to fish, I had nothing to say, for fish caught by myself have never lessened either in number or weight when relating the circumstances of their capture afterward; but oil is a slippery subject. B.

Austin, Texas, Sep. 7, 1877.

FISHING FOR RATS.—Recently several lads were seen to enter the main sewer on the left bank of the Seine at Paris by one of the barred outlets to the river. A policeman, curious to know what they were about to do, followed them, and found them seated by the edge of the turbid current fishing

for rats with a strong line and hook, the latter baited with a morsel of bacon, partially fried. When taken to the Commissary of Police they explained that they sold the skins of water-rats at from 20c. to 30c. each, according to size, for manufacturing into "kid" gloves for ladies. One of them, who was not net fishing, when questioned as to his means of earning a livelihood, stated that he was "un flot" (a wave), that is to say, in the evening, at one of the theatres, he passed backward and forward beneath canvas, painted in shades of blue, to imitate the motions of waves at sea; but the official detained him for vagabondage, considering the calling in question too vague to give a living.

## The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed; signs of suffering, etc.

—E. S. Wanmaker, of Hoboken, N. J., has a most excellent breeding, rearing and boarding kennel. He makes a specialty of breaking dogs for the Southern market.—See advertisement in another column.

—W. N. Rowley's terrier dog, which took prizes at Charleston and Quebec, has come to an ignoble end by being run over by a truck in Detroit.

LUNATICS AT THE DOG SHOW.—A novel feature of the Boston Dog Show was the visit, on Friday, of the patients of the South Boston Lunatic Asylum.

A DOG'S STRATAGEM.—The Sunday Mercury tells this story:

A gentleman in Westchester county is the fortunate owner of two dogs, one an honest Newfoundland, and the other a little black-and-tan terrier. One cold night last winter, a friend who happened to be at the gentleman's house, heard the little dog barking at a furious rate, and inquired the cause. "I'll tell you," said the gentleman; "both dogs occupy one house, and the big dog, on the principle that might makes right, takes the inside. But here's a piece of canine strategy. The little fellow runs into the yard and barks and barks, till the big fellow comes out to see what's the matter, when the black-and-tan takes the opportunity to slip into the kennel, and so secure the snug inside berth. Strange to say, as often as this trick has been played on the big dog, he seems to grow no wiser, but is sold every time."

SHOOTING A HUNTER'S DOG.—A case of interest to hunters and owners of country property was recently tried in Marin county, California. An employe of Claude Callot, of Ross Landing, went out hunting, taking Callot's dog, a valuable pointer, with him. The dog raised a fox and chased it upon the land of William Geoppart, who got his gun and went in the direction of the dog and fox. The employe heard the report of a gun, and shortly afterward the dog came home wounded in the legs. Callot thereupon had Geoppart arrested for malicious mischief in shooting the dog. The charge being proved before Justice Hughes, of San Rafael, the latter found the defendant guilty, and fined him \$1 and costs. Callot then brought a civil suit against Geoppart for the value of the dog, which he fixed at \$399.99. The case was tried one day last week, and judgment rendered in favor of the owner of the dog for \$250. The case will be appealed to the higher courts.

[We are glad to see the ball rolling in the right direction at last.—Ed.]

NAME CLAIMED.—I claim the name of Gypsy for my liver and white cocker bitch, by M. P. McKoon's Captain, out of his Bess, whelped July 13, 1877. D. M. SHARPNACK. Petroleum, West Va., Sep. 1.

## CANINE THERAPEUTICS AND PATHOLOGY—Seventh Paper.

CLASSIFICATION is highly advantageous as affording the opportunity of presenting in one view, and in comparatively few words, all the common properties and uses of any number of remedies; so that, in the subsequent description of them severally, that which is not peculiar to each may be omitted, and thus spare a vast amount of repetition. And it is essential as by fixing in the mind the properties of classes, and thus serving to recall these properties in relation to any individual article, simply by the remembrance of the class to which it belongs; it aids memory, and enables one to gather and retain an amount of knowledge which would be quite unattainable were remedies taken up and each completely analyzed by itself.

Every mode of classification is open to criticism in one or more of its details, but that of Wood seems to combine the greatest number of most desirable qualities, and for that reason has been selected.

Remedies are classified by this author first as *systemic* and *non-systemic*. To say that the former comprises those that act directly upon the system, and the latter those which act indirectly or upon extraneous bodies contained within the system, will be sufficient explanation. The first embraces the great body of remedies; the second but four small classes, which are retained merely for practical convenience, as it is desirable

that the substances composing them be associated together in the memory.

*Systemic remedies* are either general or local.

1. GENERAL REMEDIES may be considered as those which extend their action throughout the whole living system; or, operating upon one or more of the functions—as the circulatory or nervous systems—make themselves felt throughout the whole body, though not strictly universal in their dual influence. Such are necessarily either Stimulant, Sedative or Alterative; that is, either elevate, depress or alter the systemic actions.

*Stimulants*.—If the operation of stimulants be closely observed, it will be noticed that some are slow, moderate and lasting; others, on the contrary, are quick, caetergie and proportionately brief in their action; the two sets, however, run together by almost insensible gradations. This difference of operation was made, by Dr. Murray, of Edinburgh, the basis of a division of general stimulants into two sets, which he designated respectively as permanent and diffusible stimulants.

Permanent stimulants are of two classes, viz.: *Tonics*, or medicines characterized by their general stimulating influence over the functions, operating slowly, moderately and somewhat durably, either directly through the circulation or, secondarily, through the digestive function. *Astringents*—medicines which produce contraction of living tissues.

Diffusible stimulants are also of two classes.

1. *Arterial*, or those that increase the action of the heart and arteries, and along with this effect—and probably consequent upon it—causing an elevation of the animal temperature. 2. *Cerebro-spinal Stimulants*. These are of three kinds: a. Nervous Stimulants, characterized by a special but equable influence over the nervous system, generally stimulating in some degree—though not necessarily—the circulation also. They are more generally known as Antispasmodics or Nervines, by which names they will be called hereafter. b. *Cerebral Stimulants*, with more or less influence on the circulation—sometimes powerful—and are peculiarly characterized by their control over the special cerebral functions. They embrace some of the most energetic articles of the materia medica, as alcohol and opium. We shall have occasion to refer to these under the title of *stimulant narcotics*. c. *Spinal stimulants* acting specially, so far as their operation is known, on the reflex motor functions.

*Sedatives*.—These are remedies which directly depress the vital functions. While a few operate universally, as cold and water, most of them, like stimulants, act exclusively or especially on one of the two great systems, the circulatory, namely, and the nervous; hence we have:

1. *Arterial sedatives*, which act mainly, if not exclusively, in their primary influence, upon the heart and arteries, without any direct effect on the cerebro-spinal functions. They are also called *refrigerants*, as reduction of temperature is among the results of circulatory depression.

2. *Cerebro-Spinal Sedatives*; which may be advantageously divided into: a. *Nervous Sedatives*, or those that reduce generally the nervous functions, without any special reference to the brain. They uniformly, either by a conjoint primary action, or, secondarily, through their influence upon the nerves, reduce the force of the circulation also. These will be frequently spoken of as Sedative Narcotics. 3. *Cerebral Sedatives*—remedies which, while they depress the circulation either primarily or secondarily, exert a special and marked influence, of a sedative character, on the cerebral functions. Like the preceding class, they would rank with medicines usually known as sedative narcotics.

*Alteratives*.—Alteratives are medicines which insensibly change the functions or organization, without necessarily elevating or depressing vital actions, and the influence of which is mainly recognized by their effect in disease. They may be stimulant or sedative, and may produce various local effects which would rank them in other classes; but it is not through these that special curative effects are produced which entitle them to the name by which they are distinguished. Knowing so little of their mode of action, we are not possessed of sufficient grounds for subdividing them. Perhaps a simpler definition of alteratives would be, medicines which modify the nutrition of the body without producing any antecedent phenomena.

II. LOCAL REMEDIES, or those that act indirectly, or upon some special part or organ. We do not include in this section—in reference, at least, to their peculiar and characteristic properties—the general remedies which may sometimes be made to act locally by confining them to a particular part, as opium, for example, and belladonna, both of which are sometimes applied to the surface with the view of affecting exclusively the neighborhood of their application. The section includes only medicines which either have a special direction to some particular organ or part of the body, to whatever portion of it they may be applied, or which, if possessed of general powers, are employed locally for some effect different from the general; as, for instance, cantharides, as used for blistering purposes, which effect is not incident to its internal use as a medicine.

With few exceptions, all the local remedies are more or less stimulant; and the possession, therefore, of this property or that of depression, does not constitute a sufficient ground of distinction between them. Consequently, we seek other classification, and hence are most conveniently arranged according as they are employed to affect the functions, or change the organization, or to act merely as mechanical agents.

*Local Remedies*—Acting on the Functions.—The subdivisions of these are all ultimate classes of medicines, and are as follows:

1. *Emetics*, which operate on the stomach, producing vomiting; 2. *Cathartics*, which operate on the bowels, producing evacuation per anum; 3. *Diuretics*, which act on the kidneys, increasing the secretion of urine; 4. *Diaphoretics*, which act on the skin, causing or increasing perspiration; 5. *Expectorants*, which act on the lungs causing expectoration; 6. *Cholagogues*, which act on the liver, increasing the secretion of bile; 7. *Emenagogues*, which act on the uterus, exciting or increasing its secretions; 8. *Uterine-Motor Stimulants*, which favor uterine contraction; 9. *Sialagogues*, which increase the secretion of saliva; and, 10. *Errhines* or *Sternutatories*, which operate on the nostrils, causing an increased secretion and sneezing.

*Local Remedies Affecting the Organization*.—The subdivisions of these are also ultimate classes, and are as follows:

1. *Rubefacients*, inflaming the skin; 2. *Epispastics*, producing blisters; and, 3. *Escarotics*, destroying the life of a part and producing a slough.

*Local Remedies Acting Mechanically*.—These include, besides the various mechanical influences hereafter to be mentioned, the following classes of medicines:

1. *Demulcents*, bland, viscid liquids, which cover surfaces and protect them from irritation, or mingled with acrid substances obtund their acrimony; 2. *Emollients*, which soften and relax; 3. *Dilutents*, which dilute the fluids of the body; and, 4. *Protectives*, which operate by covering the surface and preventing the contact of air.

Of the ultimate classes which compose the *Non-Systemic Remedies*, we have

1. *Antacids*, which neutralize acids in the stomach, or elsewhere in the system; 2. *Absorbents*, which by absorbing acid or irritating matters, prevent or diminish their irritant action; 3. *Solvents*, which effect the solution in the stomach of substances otherwise insoluble; and, 4. *Anthelmintics*, which cause the expulsion of worms from the bowels.

The following is a tabular view of the foregoing classification, the ultimate classes being in italics.

### SYSTEMIC REMEDIES.

#### GENERAL REMEDIES,

##### Stimulants,

##### Permanent Stimulants,

##### *Astringents,*

##### *Tonics,*

##### Diffusible Stimulants,

##### *Arterial Stimulants,*

##### Cerebro-nervous Stimulants,

##### *Nervous Stimulants,* or *(nervines and antispasmodics,*

##### *Cerebral stimulants,* or *Stimulant narcotics,*

##### *Spinal Stimulants.*

##### Sedatives,

##### *Arterial Sedatives,* or *Refrigerants.*

##### Cerebro-nervous Sedatives,

##### *Nervous Sedatives,*

##### *Cerebral Sedatives,*

##### or *Sedative Narcotics.*

##### Alteratives.

#### LOCAL REMEDIES,

##### Affecting the Functions.

##### *Emetics,*

##### *Cathartics,*

#### NON-SYSTEMIC REMEDIES.

##### *Antacids,*

##### *Absorbents,*

##### *Solvents,*

##### *Anthelmintics.*

No apology seems necessary for drawing upon a well-known author for the material of this section, or even for adapting his language to teach the desired system. It is as near perfect as the present state of our knowledge permits, perhaps, though not entirely original with Dr. Wood.

The attention of the reader is particularly requested to a few considerations, which are necessary to a proper understanding of this arrangement. The remedies named in the several classes, while they agree in the possession of the peculiar property which characterizes the class, often differ much in other respects, and in many instances are applicable to very different purposes. They are classified so far as possible according to their most distinctive property, or that for which they are most valuable therapeutically, and then, in the description of each remedy, all its other remedial properties and applications are noted, so that its individual character may be well understood.

Again, it happens, not unfrequently, that a remedy belonging to one class, has additional powers which serve to rank it in another. In such cases, it is considered in both, being treated of at large in that with which its most important therapeutic character would rank it, and in the other, only so far as may concern its categorical position. In therapeutics it is not any particular medicinal substance or remedial agent that we have in our minds, but the condition of disease calling for certain remedial influences; and it is important that our knowledge should be so arranged in the memory as most readily to suggest the particular medicine, that may be best calculated to exert this influence. This object is certainly better attained by ranking all the remedies together calculated to meet each indication, and to have them associated in our mind, than by having the whole character of each body, in all its different relations and applications, impressed upon us at one exclusive view. Thus it will be more useful, practically, when we have occasion for an arterial sedative, emetic, expectorant or diaphoretic, to have tartar emetic associated with each of these classes in our recollection, than to know it only as a preparation of antimony having a great diversity of properties, and thus be compelled to think over it, along, perhaps, with a num-

ber of other bodies, in order to ascertain whether any one of these properties may suit our present purpose.

In reference to the modes of operating or the several remedies in producing the effects which serve to classify them, we shall offer and enforce those views which seem most in accordance with reason and experience, not omitting, however, to allude to others which may have been advanced. At the same time we desire always to be understood as considering the knowledge upon this point to be provisional in a great measure, and liable to be materially modified in the progress of discovery.

**ALGERIAN GREYHOUNDS.**—These greyhounds are held in the highest esteem, and are considered as very valuable, large sums of money being frequently paid for good specimens. Their color is generally a light-brindle mousey tint, without any admixture of any other color. They are generally tall, stoutish, very powerful, and fairly fast. Their heads are rather peculiar, inasmuch that they show the *os occipitis* quite as much as many hounds; and they have, withal, an uncommonly long pair of jaws, which gives them a rather wolfy appearance. They are generally desperate fighters, and are, as a rule, very troublesome with strangers, being apt to seize any individual whose looks or dress do not exactly coincide with their own opinions on the matter. And as their masters gather delight in seeing any onslaught of the sort, and tacitly or openly encourage them in such little diversions, why it is not always safe for the bare-legged beggars of the province of Algiers or Tunis to get into too close contact with these sharp-toothed customers. I bear in mind now a treat of the sort we had when we landed at Algiers (for the first time, as far as I was concerned) about eight years ago. We were "doing the Mediterranean," and, of course, *faucile principes*, Gibraltar had our first visit; its opposite neighbor, Algiers, came next in our attention, and we got there ashore early in the morning, so as to see what was to be seen before the mid-day heat had rendered walking well-nigh impossible. Two or three vagabonds who were loafing in the sun, and scowling at us, suddenly got up and began scampering away. Coming up the street was an Arab chief, on his gray horse, and by his side trotted a very handsome *Sloughi* (greyhound). Whether the said chief had said something, or not, to the dog it would be hard to say, for his countenance remained throughout perfectly imperturbable; but, anyhow, the coursing we had then and there was an infinite treat to our men, who fairly roared with laughter. The way this *Sloughi* went after one, then the other, and then the third of these beggars, and gave a wrench here and a wrench there, was, to say the least, very suggestive. In a moment the place was cleared, and the dog went back to his master, who looked as serious as ever, but I strongly suspect that in his innermost soul he was delighted. All *Sloughis* are marked by their owners with a star on the forehead, why, I cannot tell, a mere custom, I presume. It is also said that their fore-legs are occasionally fired to give strength to the articulation. Why the Arabs are so fond of their greyhounds, however, is very easily explained. First of all, since their many periodical insurrections, by which they have repeatedly tried to set the French authorities at defiance, the French have found it expedient to forbid the sale of gunpowder to the tribes, for fear they should use that powder against themselves. This being the case, any Arab who has sporting tendencies must either resort to some device in order to procure gunpowder, or, failing in getting any, he must sport without. But sport he shall, for the love of sport is in him a second nature. He would decidedly prefer using a gun. The noise of the explosion, the flash of the flame, the smell of gunpowder, are all very dear to his soul, but if he cannot get the precious compound, his dog and his hawk will amply supply his needs. Not that he cares much himself for game, mutton is his favorite dish on gala days; but when away in the wilderness he likes to pick up whatever game he finds, or, if near a town, he kills birds and hares for the markets; for I need not state that the European residents have naturally caused a very great demand for anything of the sort.

Now, a good *Sloughi* experiences no difficulty whatsoever in keeping his master and family in great comparative comfort. The price of a hare will keep them all for a week; so no wonder the Arab prizes the clever *Sloughi*, who never or rarely misses his quarry. Of course, it will readily be understood that there is no question about fair coursing in such proceedings. A hare is found, let the greyhound kill it and bring it back, and he is a good greyhound; let him miss it and miss killing others, and his own fate will be pretty clear. In short it is merely a question of market. Most Algerian greyhounds hunt for their own game, and have a very fair amount of scenting powers. They are, to tell the truth, likely to own this last property all to themselves, for, although the British officers garrisoned at Gibraltar and the French officers who reside in Algeria, have repeatedly imported pointers, setters and spaniels into the Algerian territory, it has always been found that eventually these dogs lost their scenting faculties to an alarming extent, and their offspring are almost invariably noseless. Therefore the *Sloughi* is likely to be the only canine assistant to be relied upon, and he thrives on the terrific heat which dulls his European cousin's faculties.

The Algerian greyhound, like ours, is very "tender." As soon as winter draws nigh he is wrapped up in his clothing, and the greatest care is paid him. In fact, throughout his life, he is regularly made a pet of. It is not unusual by any means to see very young puppies nursed by the women, as though they were babies, and sharing with the babies in all their privileges. Should a *Sloughi* bitch die in giving birth to her litter, the youngsters are at once handed over to the care of the women who rarely fail to give a very good account of their charges. When a good dog has achieved a reputation, the owners of bitches flock to his master from hundreds of miles for the dog's services, pretty much as is done within the shores of the "little tight island," but in the desert the journeys have to be performed on horseback, and a great deal of time and trouble have necessarily to be taken to ensure a desirable crossing. Such is the horror of Arabs for any low admixture of our blood that they sometimes kill the bitches that have granted their favours to sheep dogs and other breeds, or, if they spare her life, her progeny is doomed. When, however, the connection is of the desirable sort, many are the applications made for puppies, even before the puppies are born. When three or four months old the youngsters are made to race after and kill rats. When five or six months old they are entered to hares; but it is only when fully a year old that they are shipped at gazelles, and then, accord-

ing to General Dumas, only among ones, so as not to exhaust the dogs. It is only when fully developed that they are brought to course full-grown gazelles. The way in which the latter sport is carried out is simple enough. The dog is secured by a leash, and hunts the scent like a Lynx. When the gazelles are discovered the master slips his dog, who thereupon chooses among the herd a particular animal, to which he devotes his attention, generally with success, if he is up to the mark; but it does really take some running to secure a three-year old gazelle, so, generally, the greyhound runs cunning, until he gets near enough for a rush, when he puts on all steam and springs on his quarry. For hares, no precautions, such as putting the dogs in slips, are taken. The Arab, either on horseback or on foot, accompanies the dogs, who are loose, and he beats the ground, while they hunt about for scent. As soon as a hare is started, at her the *Sloughis* go, and, of course, she is soon collared.

These greyhounds are also employed for partridge hawking. The sportsman carries his hawk on his turban, and when the greyhounds flush a bird or a covey, away sails the hawk after them, and soon secures one. Formerly, however, only the chiefs of tribes kept either hawks or greyhounds. It would have been then considered perfectly ridiculous for any man but one of gentle blood to own either. No matter whether rich or poor, the chief was almost by his birthright entitled to such companions in the chase; but no matter how well off a commoner might have been, he would have been laughed at and derided by his tribe fellows if he had the impudence to take up greyhounds and hawks. Now, however, things have altered. Since the conquest of Algeria by the French many of the chiefs have lost their authority and not a few have been killed. Their French manners told on the old notions, and now any one who can afford it may keep either a *Sloughi* or a hawk, or both, with, however, this distinction, that the well-to-do Arab keeps them for sport, whereas his poorer brethren resort to them simply as means of subsistence. No wonder then that such a value is set upon the Algerian greyhound! When a *Sloughi* dies, General Dumas tells that it is, for his master's family, the greatest calamity that could possibly affect it; since he literally earned the daily bread. In the ordinary routine of life the dog is treated as well as the head of the family himself, being fed on the best that the resources of the tent can procure, and he sleeps usually by the side of his master, sharing the same couch. These dogs' affection for their masters is quite touching. Some die of grief if their master remains away for any length of time, and all pine away from the moment they are separated from him. On his return, however, the wildest joy prevails in the household, and it is not rare for the *Sloughi* to spring on his master's saddle for his caresses. Very many of these greyhounds wear ornaments of all kinds round their necks, and some of these fancy collars, when the dogs belong to rich men, are very valuable; whereas the *Sloughi* who belongs to a poor man is adorned in a rough-and-ready fashion with common shells, strung together on a bit of common twine. In short, no matter who owns him, the *Sloughi* is pretty sure to be very well treated. This is all the more curious that all other breeds of dogs are invariably looked upon with contempt by the Arabs. They cannot rank a pointer or a setter, for instance, with their *Sloughis*. They have not the sense to. They do not understand the subtlety of a dog standing to his point and being backed by his companion. They only admire a display of speed, because it appeals to their eyes without fatiguing themselves; hence the great adoration which they pay to the *Sloughis*. The dog that can catch the game is the dog, by excellence, for them, and no doubt they are quite right in their way; for of what earthly use would a pointer or setter be to men who cannot shoot, either flying or running. As a matter of fact, most Arabs, when accompanying Europeans as guides, are wonderfully struck by the work of the Pagan's dogs; but they preserve a very stolid countenance, and only among themselves do they discuss the performance, and, whilst admitting the admirable fashion in which their French or English employers manage their sport, yet they invariably conclude their discussion by the exclamation, "It is all very well, but give us a good *Sloughi*, and then we want no gun, and no powder and no shot to secure our game!" Of course, as far as that goes, it is right enough from their point of view.

Some *Sloughis* belonging to poachers are trained to half-point at game, when their masters, if they own guns, put the hares on the ground, and if they have no guns they knock the hares on the heads in their forms with clubs, or when partridges are flushed, they throw, in the "brown" of the covey, a short, heavy stick, which rarely fails to bring down to mother earth a few of the feathered tribe. That it takes a good deal of practice to be successful in any undertaking of the sort many sportsmen will admit readily, but that it is being done by many of these men as their daily avocation is well known to European residents in Algeria, and a visit to the markets on any day will convince the most skeptical. Almost all the birds brought there will show, as plain as could be, marks of the sticks, by their smashed heads and broken wings; but no gunshot will be found in them. As for the hares, they are either caught by the *Sloughis* or smashed with clubs by the *Sloughis'* owners, and not one hare in a thousand will show traces of shot, that is when they come from the tribes, for now and then a European finds too much of his game on his hands, and sells it, in which case, of course, every head of it has been duly shot.

Some of the European residents have, of late, imported greyhounds of their own, or procured some *Sloughis*, and a good deal of coursing now takes place in the neighborhood of all large towns, wherever consulates or large stations are established. Thus, many of the French officers garrisoned at Algiers are to be seen with their British *confreres* from the other shore, now and then, cavalcading about in the country in search of a little excitement with their swift dogs; but gazelles are only to be found now in the desert, and one must ride many wearisome miles to indulge in the sport.

Wild boars are also roused by *Sloughis*, but the dogs have only to harass them and drive them on. They could not kill the boars. The Arabs, however, despise boars. To them they are *unclean* animals, and when they kill one they never touch it, but allow it to rot away where it fell, and carnivora and birds of prey are welcome to make a meal of it.

To resume, then, the *Sloughi*, or Algerian greyhound, is essentially the sporting dog for Algeria. None other is acknowledged by the native population, and he (the *Sloughi*), when good, is looked upon there almost as a demi-god.—*ATLANTIC IN THE LIVE STOCK JOURNAL.*

**THE "KENNEL REGISTER."**—I take this means of answering certain questions constantly asked me regarding the *Register*: 1st. The labor of compiling is so great the *Register* will not be sent before the early part of 1875.

2d. The price cannot be determined till the book is in press. 3d. It is utterly impossible to give now the numbers of dogs'

entry in the completed volume, as the pedigrees sent in must be divided into classes and arranged alphabetically before numbers can be assigned.

4th. The entries closed the first of this month, and cannot be extended for any purpose, so that no pedigrees can be received except those for which blanks have been already forwarded. It is intended to issue a volume yearly, and those dogs not included in Vol. I. can appear in its successors.

ARNOLD BURGESS, Compiler Kennel Register.  
Hilledale, Mich., Sept. 3.

**Boston Dog Show.**—The Show closed Saturday evening, having been a success in every way, though it is much to be regretted that there were not more exhibits in the first division. The awards are as follows:

Division 1.—Sporting Dogs.—Class 2.—Champion Irish setters.—Best dog, No. 1, Elcho, William Jarvis, Claremont, N. H., 1st premium, \$25; no competition. No bitches entered in this class.

Class 3.—Champion Gordon setters.—1st prize, \$25, Shot, belonging to A. F. Copeland of Boston. No bitches, no competition.

In 1st, 4th and 5th classes there were no entries.

Open Classes.—Class 6.—Native English Setters. 1st prize, \$20, to L. J. Calley, Boston; 2d prize, \$10, to J. Cleaves, Mount Pleasant; J. A. Lakin of Westfield, dog Ned, B. Norton of East Boston, C. A. Tozer of Boston, Francis Harrington of Salem, very highly commended. Best bitch, \$20, to John S. Sides, Portsmouth, N. H.; 2d best, \$10, E. E. Hardy's Diana of Brooklyn; J. Dobson's dog of Boston, very highly commended. Best dog puppy, \$10, E. E. Hardy's Rungler. Best bitch puppy, \$10, Chelsea.

Class 7.—Imported red or red and white Irish Setters. 1st prize, for dog, \$20, J. Evans, Newton; second best dog, \$10, Dexter H. Follett, Boston.

Class 8.—Native red or red and white Setters. 1st prize, \$20, C. M. Barrett; 2d prize, \$10, A. Nelson, Portsmouth, N. H.; W. B. Linsley's dog, Bolton Long's dog, very highly commended; Mr. Hollingsworth's dog, M. E. Hervey's dog, highly commended. Best bitch, \$20, to J. A. Davis, Boston; 2d best, \$10, Daniel Sharp, Jr., Boston. Bull dog puppy, \$10, M. Heckle, Granville; best bitch puppy, \$10, Edwin Roswell, Lynn.

Class 9.—Gordon Setters, black and tan or black, white and tan, either native or imported, 1st prize, \$20, to J. H. Doane of New Bedford; 2d best, \$10, S. Bradstreet, Jr., Dorchester; Fred A. Taft, Dunham, very highly commended; W. J. Wright, Duxbury; C. A. Tozer, Boston, highly commended. Best bitch, \$20, to S. W. Redman, Burlington; 2d, \$10, to Dr. John H. Wright, Brighton. Best dog puppy, \$10, to E. D. Mandell, Jr., New Bedford; A. C. Mudge, Boston, very highly commended. Best bitch puppy, \$10, Wm. Clegg, East Attleboro; H. L. Kinsley, Stoughton, very highly commended.

Class 10.—Pointers, of 50 pounds weight or over. Best dog, \$20, Martin L. Keith, Boston; 2d, \$10, G. L. B. Tyler, West Newton; L. M. Rand, Worcester, very highly commended. Best bitch, \$20, to G. H. C. Hadley, Milford; 2d best, \$10, to No. 7, no name.

Class 11.—Pointers under 50 pounds weight. Best dog, \$50, L. M. Rand, Worcester; 2d best, \$10, T. B. Warren, Chelsea. Best bitch, \$20, Dr. Ed. J. Foster, Boston; 2d best, \$10, L. M. Rand, Worcester.

Class 12.—Pointer puppies. Best dog, \$10, to Charles Allen. Best bitch, \$10, James Carroll, Portsmouth, N. H.; F. Fagan, Boston, very highly commended.

Class 13.—Retrieving and Field Spaniels, other than pure Irish.—1st prize, \$15, Charles F. Curtis, Boston; 2d, \$10, M. H. Bradley, City Point, South Boston. No 10 in this class, being the only pure Irish dog in the show, was recommended for a special prize of \$10.

Class 14.—Cocker Spaniels.—Best, \$15, to Charles Allen of Worcester; 2d best, \$10, to C. F. & A. C. Joslyan, Malden.

Class 15.—Fox-hounds.—Best couple, No. 203, 1st prize, \$15, Lewis P. Bartlett, Arlington; 2d best couple, Nos. 5 and 10, \$10, Charles Brown.

Class 16.—Fox Terriers.—Best, \$15, James Lawrence, Groton; 2d best, \$10, A. I. Watts, Boston.

A special prize of \$5 was awarded to Dr. N. W. Hawes of Boston for his Irish retriever Lena, and her six pups of that strain.

Medals were awarded as follows: William Jarvis, Elcho, L. M. Rand, Worcester; S. Parkman Shaw, Longwood; Arthur H. Nichols, Boston; Edward Faxon, Boston; William Hooper, Dorchester; Albert E. Proctor, Boston; H. K. Horton, Quincy; C. E. Fuller, Boston, and F. A. Newlan, Boston.

It is worthy of mention that three prizes in the above list were given to dogs of the Rock strain—one first prize for the best native setter; the second prize for bitches, and the first prize for the best dog pup. E. E. Hardy's pair of bitches of the Rock strain were highly commended.

## Yachting and Boating.

### HIGH WATER FOR THE WEEK.

**CAPE MAY REGATTA.**—The race from Sandy Hook to Cape May and return, for the Bennett Challenge Cup, was sailed by the four yachts Dreadnaught, Idler, Rambler and Vesta. They started at a little past 5 o'clock P. M., Sept. 4th. The race resulted as follows:

| Name.            | Start. Tuesday. | Finish. Thursday.     | Elapsed time. |
|------------------|-----------------|-----------------------|---------------|
| Idler.....       | 5 00 50 P. M.   | 9 40 44 A. M.         | 40 30 54      |
| Rambler.....     | 5 10 11 P. M.   | 12 14 40 A. M.        | 49 03 49      |
| Vesta.....       | 5 11 00 P. M.   | 1 45 50 P. M.         | 44 34 00      |
| Dreadnaught..... | 5 00 50 P. M.   | Did not round lights. |               |

**MASSACHUSETTS—Nahant Yacht Club.**—The last regatta of this club for the season of 1877 was sailed off Nahant last Wednesday. There were two prizes of silver for each class where more than two yachts sailed. The courses were: First class—From starting point off Steamboat wharf, thence to

buoy off Whithrop Head, leaving it on the port, to Whistle buoy off the Graves, leaving it on the port, and back to the point of starting; for the second, third and fourth classes—from starting point to the buoy off Whithrop Head, rounding the same and back to point of starting. The following is the summary:

| FIRST CLASS.              |         |            | Actual Time. |
|---------------------------|---------|------------|--------------|
| Name and Owner.           | Length. | H. M. S.   |              |
| Shadow, J. Bryant.        | 34 06   | 1 48 53    |              |
| Breeze, J. G. Minot.      | 46 00   | 1 52 06    |              |
| SECOND CLASS.             |         |            |              |
| Peri, George Lee.         | 18 06   | 1 34 23    |              |
| Sankey, John Bryant.      | 18 04   | 1 40 51    |              |
| Edith, W. C. Burrage.     | 19 04   | 2 05 40    | Withdrawn.   |
| Water Lily, P. Grant, Jr. | 19 00   |            |              |
| Arctura, J. C. Sharp, Jr. | 19 00   |            |              |
| THIRD CLASS.              |         |            |              |
| Bessie, G. P. Upham, Jr.  | 17 04   | 1 46 45    |              |
| Nora, R. G. Shelling.     | 16 11   | 1 50 02    |              |
| Avis, W. C. Haskell.      | 17 01   | Not taken. |              |
| FOURTH CLASS.             |         |            |              |
| Splash, C. E. Hodges.     | 10 04   | 1 53 36    |              |
| Gracie, G. Minot.         | 12 00   | Not taken. |              |

**NEW YORK.—Troy, Sept. 5, and 6.**—The regatta of the Upper Hudson Regatta Association was rowed over a course of one mile and a half straightaway. The races were: Four-oared shells—Entries: Wolvenhooks and Cohoes. The boats fouled, but rowed ahead, the Wolvenhooks coming in first. The Cohoes' claim of foul was allowed. Pair-oared race—Entries: W. R. Hill and M. Monahan, of the Albany Olympic Club; C. Jameson and M. Fenton, of the Albany Mutuals. Won by the former in 12m. 4/5s. Junior Singles—First heat won by Higgins of Cohoes in 11m. 42/5s. In the second heat Miles, of the Wolvenhook; Harries, of the Mutuals; Wharrington, of the Waterlarks, and Fulton, of the Mohawks, started. Won by Miles in 11m. 55/5s, Fuller second, Harries third and Wharrington last. Double scull race—Entries: Wolvenhooks, Miles and Craig; Laureates, Smith and Prescott; Ulysses, Thayer and Marshall; Mutuals, Hays and Brink and Mosley. Won by the Mutuals in 10m. 20/5s, Ulysses second, the Laureates and Wolvenhooks distanced. Six-oared gig race—Entries: Mutuals, Olympics and Ulysses. Won by Olympics in 9m. 5s. Adams second, in 9m. 9/5s. First heat of the senior singles—Williams, of the Waterlarks, and Tompkins, of the Wolvenhooks, were the contestants. Tompkins won in 10m. 30s. Second heat—Entries: H. A. Viets, Laureate Club, and F. A. Davey, Mutual Club. Won by Davey in 10m. 14/5s. Final heat won by Tompkins in 10m. 15/5s. Four-oared race—Entries: The Ulysses, C. F. McMurray, F. Spotten, W. S. Fiack and F. E. Adams; The Mohawks, M. Fuller, J. C. Reed, C. Vanderveer and J. Healey; The Olympics, J. H. Given, C. Gould, W. R. Bliss and Martin Monahan. Won by the Olympics in 8m. 55s. Fifley, 9m. 53/5s; Mohawks, 9m. 7s. Final heat of four-oared race—Won by Olympic in 8m. 51/5s. The Cohoes time was 9m. 83/5s. Junior sculls—Final heat won by Higgins in 6m. 38s. Miles' time was 10m. 24s.

**MANHATTAN YACHT CLUB, Sept. 11.**—The first union regatta of this club was sailed over a course for the first, second, third and fourth classes was from an anchorage off 103d street to the southward and eastward of Ward's Island; thence to the northward and westward of South Brother and Riker's islands; thence to the southward and eastward of Throggs Point Buoy; thence to the westward of Stepping Stones Light, and thence to and around the Gangway Buoy, returning to the same course, passing between the home stake and the club house. The course for the fifth class was the same as the others, excepting that when round the light at Stepping Stones they returned to the starting point. The prizes were elaborate gold badges. The official time was as follows:

| FIRST CLASS CABIN BOATS. |               |                 |  |
|--------------------------|---------------|-----------------|--|
| Name                     | Elapsed Time. | Corrected Time. |  |
| C. H. Arthur.            | 4 14 02       | 4 14 21         |  |
| Petrel.                  | 4 49 20       | 4 43 20         |  |
| SECOND CLASS—OPEN BOATS. |               |                 |  |
| Dare Devil.              | 3 57 23       | 3 53 23         |  |
| Polly.                   | 4 29 00       | 4 29 00         |  |
| THIRD CLASS—OPEN BOATS.  |               |                 |  |
| Puck and Luck.           | 4 03 25       | 4 03 25         |  |
| Clara S.                 | 4 33 45       | 4 32 37 1/2     |  |
| Artful Dodger.           | 4 20 40       | 4 17 57 1/2     |  |
| FOURTH CLASS.            |               |                 |  |
| Sophia Emma.             | 4 19 10       | 4 18 20         |  |
| Conquette.               | 4 25 45       | 4 25 45         |  |
| Geo. B. Deane.           | 4 28 45       | 4 28 45         |  |
| FIFTH CLASS.             |               |                 |  |
| Wave.                    | 3 23 30       | 3 23 20         |  |
| Carrie D.                | 3 31 30       | 3 31 30         |  |
| Albee.                   | 3 41 30       | 3 39 30         |  |
| Ship Jack.               | 3 42 30       | 3 42 30         |  |
| H. P.                    | 3 46 30       | 3 42 40         |  |
| C. H. Longstreet.        | 3 49 30       | 3 48 40         |  |
| A. Varian, Jr.           | 4 06 30       | 4 04 40         |  |

## CANOE NOTES.

ON the Passaic this summer canoeing has increased in favor. One year ago Newark boasted six canoes, among them the Delaware, Dragon, Saranac and Qui Vive. Now there are not less than fifteen, including the Rambler, Passaic, Delaware, Thetis, Spray, Arrow, Josephine, Bess and Qui Vive II, with several that are nameless. It is no unusual thing to see two or three of these pretty crafts cruising in company on a pleasant afternoon, and certainly they present a fine picture, gracefully careening under the pressure of their white sail. The favorite rig is the standing lug. The Qui Vive II carries a lug main with jib and dandy. She weighs when empty 43 1/2 lbs., or 51 lbs. with fittings complete. On Monday, Sept. 2, the Passaic, under the paddle of her owner, Mr. Fred Hussey, of Orange, started on a cruise around Long Island. He goes eastward through the bays of the south side and returns by the Sound.

On Wednesday, Sept. 5, the Qui Vive II was sailed by her owner from Newark to New York. The distance was accomplished in four hours. The run up New York bay was made under all sail in less than two hours. The roughest water was encountered between Governor's Island and the Anchor Line piers, and although no apron was used, only about half a cup of water found its way into the well, and that came from cross seas caused by steamboat swells.

MAGVA.

**NEW JERSEY.—Elizabethport, Sept. 8.**—First annual regatta of the Rowing Association, Staten Island Sound. There was but one race, that for double sculls. The crews entered were:

Bartlett and Moore, Boyd and Rogers, Cooley and Kellogg, Kendall and Davis, Darling and Husband, Darling and Diedrick, Ballantine and Marsh. The course was a mile and return. Bartlett and Moore won the race in 20m. 30s.

—The Oceanic Yacht Club, of Jersey City, has elected the following officers for the ensuing year: Commodore, Charles F. Taylor; Vice Commodore, George Smith; Treasurer, Louis Heller; Secretary, William W. Poland; Measurer, John Demarest.

## New Publications

THE ATLANTIC has a continuation of Mr. Aldrich's story, "The Queen of Sheba," Mr. Howell's "A Counterfeit Presentation," Mr. Whipple's papers on Dickens (this being on "Great Expectations," and Edward H. Knight's "Crude and Curious Inventions at the Centennial." T. R. Lounsbury contributes an interesting study of the "Fictitious Lives of Chaucer," and Eugene Benson has a paper on "Dr. Stendhal." David A. Wells discusses the important question, "Are Titles and Deeds Property?" Charles Hale has a pleasant descriptive paper on "Consular Service and Society in Egypt." There are several poems and a sad little story, "The Child of the State."

LITTONCOTT'S has two illustrated articles, "Among the Kabyles," by E. C. Bruce, and "A Paduan Holiday," is described by Charlotte Adams. Howard M. Jenkins has a sketch of the "Battle of Brandywine," and there is a paper on "Madame Patterson Bonaparte," and Edward Duryea writes of "Our Blackbirds." The departments of poetry and fiction are well filled.

THE GALAXY opens with a discussion, by Isaac Newton, of the question, "Has the Day of Great Navies Passed?" and a somewhat kindred subject, "The American Army," is treated by F. Whitaker. "Americanisms" is by Richard Grant White, of course. There are interesting articles on "Inez De Castro, of Portugal," "Venice," "Points of Interest in England," "A Chapter of Oddities," and a more serious one on "The Municipal Debt of the United States." Poetry and fiction are well represented, and the editorial departments are up to the usual standard of vivacity and timeliness, which usually characterizes them.

St. Nicholas presents as a frontispiece a spirited picture of Col. Kane's coach. The opening article is descriptive of "Young Folks' Fun in Central Park." There is a charming Scottish story by McDonald; a rollicking story entitled "Drummer Fritz and His Exploits," and among a host of other good things is a well written account of "An American Circus in Brittany." Who but a schoolma'am, and the "Little Schoolma'am" at that, would ever have thought of that paper on "School Luncheons?"

## Answers to Correspondents.

### No Notice Taken of Anonymous Communications.

E. Kuhn, City.—Read the notice at the head of our kennel column and govern your puppy accordingly.

J. O. F., Hornellsville, N. Y.—What is the price of "Long Range Rifle Shooting?" Ans. 25 cents.

SUBSCRIBER, Menomonee, Wis.—Your description is too meagre; see head of kennel column.

F. G. L., Waltham, Mass.—From your description we are unable to point out the fault with your gun. Consult a gunmaker.

F. H., Boston.—Shepherd dogs are "collies." Fishing is quite inferior in Chataqua Lake, N. Y., owing to the depredations of poachers.

J. J., Milwaukee.—Are the "unaccountables" which so often occur at Creedmoor made when new shells or old are used, or both? Ans. both.

B. DE S. P., Ithaca.—We know of no one at present who was a greyhound for sale. Try advertising in our columns. Mr. Waddell will probably give you good testimonials if you write him.

C. L. I., Phila.—My setter dog is very tender about the ears. Although there are no aches visible he will yelp at the slightest twitch of the ear. Ans. Should not trouble about him at present.

W. T. H., New Bedford.—What kind of sport, hunting and fishing can I find in southern Georgia, or northern Alabama this fall and winter? Ans. Deer, bear, wild fowl, bass, etc.

W. T. R., N. Y.—To show good penetration how many sheets of paper should a ten-gauge breech-loader penetrate with 3/4 drs. powder, 1 1/4 oz. No. 8 shot at 40 yards? Ans. 30 to 35 sheets; 120 pellets would be fair penetration.

J. C. M., Concord, N. H.—What is the correct number of pellets in the oz. of English chilled shot of the different sizes? Ans. A. A. 40; A. 50; B. 58; B. 75; 1, 82; 2, 112; 3, 135; 4, 177; 5, 215; 6, 230; 7, 241; 8, 600; 9, 951; 10, 1,726.

STIGEL, Cockeysville, Md.—What is the time on pheasants, quail and woodcock in season in Pennsylvania? Ans. Woodcock from July 4 to January 1. Quail October 15 to December 15. Ruffed grouse October 1 to January 1. Traps, nets, snares, etc., prohibited.

G. H. Jones, Louisville, Ky.—Is the bird known in South Carolina as the rice bird, in Virginia as the reed bird, further north as the ortolan and bobolink one and the same bird? Ans. The bird known as reed and rice bird is the bobolink (*Dolichonyx oryzivorus*). But the ortolan is the sora, or common rail (*Porzana carolina*).

F. S., Boston.—Can you tell me where within 48 hour's rail of Boston I can get good woodcock and partridge shooting for two weeks in October? Ans. The reports from Laconia, N. H. would seem to point this out as a favorable locality.

R. H., Brooklyn.—Entries for the Judd short range and champion matches are to be made at office of N. K. A. 23 Park Row, or at range on days of match. In Judd match minimum trigger pull 6 lbs. in other matches named not less than 8 lbs.

S. T., N. Y.—Will you inform me whether robins may be shot this year on Long Island and also when the season for ducks begins? Ans. Do not shoot robins at any season. You may kill ducks from September 1 to May 1.

ROD AND REEL, Fall River.—Will you please inform me the right name for the fish I send you in a paper box? All persons in this vicinity are stuck on the proper name for this fish. Ans. The fish is a yellow caranx (*caranx crysoleus*). It is also known as the yellow mackerel (*seaber crysoleus*). It runs with the butter fish, and is not uncommon in Eastern waters.

J. W. F. W., South Boston.—Allowing the split nose to be a deformity only, is it liable to occur with the setter as well as the pointer dog? or in other words is it a sign of cross breeding with the pointer when he split nose happens with the setter? Ans. Very likely to be.

J. G. McK., Peterboro, N. H.—I have a 38 cal. muzzle-loader weighing 7 lbs., bullet a flat pointed cone, weighing 136 grains. How many grains of powder ought I to use for shooting 200 to 500 yards? I have been using about 30 grains and it carries accurate up to the distance named; Can I use a different shape of bullet and get better results? Ans. With a hardened bullet larger charges might be used with good effect.

H. E. W., Phenix.—Myself and three companions have decided on a hunting trip to Florida. We intend starting Nov. 1. Now, can you tell us a desirable locality to make our objective point? We intend to camp and board ourselves, if we can. Ans. Escambia county would be a good point; may be reached via steamer or rail from Pensacola.

WACO, Waco, Texas.—When, in shooting double balls, a man fires both barrels of his gun at one, when the traps are sprung, is he allowed two more balls? or are the two scored against him in case he misses? or if he hits one and misses the other what is he entitled to according to Bogardus' rules? Ans. He is entitled to what he breaks and nothing more. It was his own fault.

F. H. P., San Francisco.—Can you give me any information regarding the habits and manner of breeding of the fresh-water crawfish, or small lobster? On the vineyard belonging to our firm we have a trout stream and are about to lay out a few fish ponds. Among others we would like to raise some of these crawfish which are very rare on this coast. I should also wish you to recommend me a good work on fish culture. Ans. See our natural history column.

W. H. W., Louisville, Ky.—1. Is the bird known as the quail in the East and as the partridge in the South and West a quail or a partridge? 2. Is the ruffed grouse called the partridge in the East and the pheasant in the West a pheasant or not? 3. Have we any pheasants in the U. S.? 4. The bird quail belongs to the family of *Perdix*, genus *Oryx*, though it is not a true representative of the partridge family. 2. It is not a partridge or a pheasant, but simply a grouse—ruffed grouse. 3. No.

G. A. S., Nyack, N. Y.—Please prescribe for my setter pup, 5 weeks old, fed on bread, milk, and well-cooked meat; eyes bright and clear, and do not notice any change in appearance. Breathing regular; bowels rather open; appetite generally good; is in a clean and warm place, plenty of sun, ventilation, etc. He has passed in his stools things that look like white worms from 1 1/2 to 3 inches long and nearly as thick as a match. They do not seem to have any life. Ans. Use prescription No. 2 of "Gazetteer" in doses as per table on page 542.

NIMROD, New York.—Do you know of any place beyond Harlem River and in the neighborhood of Jerome Park where one can drive and have a little private practice with shot-gun and short range rifle? don't want any public resort, but would like to pay for use of private grounds. Ans. We do not. By advertising in our columns you will probably secure that which you desire.

—Washing in all ages and all religions has had a sort of religious significance, its effects are so important to the physical and consequently to the moral well-being. Soap may, therefore, be looked on as one of the consecrated necessities. No wonder, then, that B. T. Babitt's Toilet Soap, recently introduced, takes such a hold on popular favor. Why not, indeed? Its components are of the purest oils and there is no need of artificial fragrance. It is the most emollient and delicious of toilet soaps.—*Adv.*

S. R. G., Philadelphia.—Does it injure nickel-plated and blued pistol barrels to keep them constantly covered with grease? I have heard that oil or grease softens the metal and renders it more liable to rust after the lubricating substance is removed. I live in a very moist atmosphere and find that grease is the only thing that will keep my pistol-barrels from rusting. Ans. Certainly not. On the contrary, good lubricating material devoid of acids is beneficial. Vegetable oils are usually objectionable, as containing an acid and hence they predispose metals to rust. If this is removed, or if animal oils are used no harm can possibly result.

C. L. A., Stoughton, Mass.—Will you kindly send me recipe for a vermifuge, avoiding area nut, for my pointer, one year old, who is evidently troubled with worms? Ans. Santonine, 8 to 10 grains; quinine, 3 grains; lepidandrin, 2 grains; aloin, 1/2 grain; powder and mix intimately, and divide into three powders, which give three times a day on three alternate days. The morning of the day on which the powders are given give the dog a dose of either salad or castor oil. This makes nine powders and three doses of oil the animal will receive. One day's dosing, followed by oil is usually sufficient, but to thoroughly eradicate the parasites the above way is best.

SHARBOTT LAKE, Ont.—Any one who understands the habits of the black bass and knows when and how to fish for them will not be disappointed here. They run large, averaging 3 lbs. weight and there seems to be two varieties. I do not confound the Oswego with the black, but one variety of the latter seeming to be blacker, chunkier and more gamey than the other, which is the same as found in the St. Lawrence. These black fellows are known here as "humpbacks." Perhaps one is the male and the other the female, and as the fish run larger than in the river, the difference is more easily distinguishable. Ans. We cannot undertake to decide from the meagre description given.

R. E. P., Bloomington, Ill.—Would you please define for me and several other friends (who, with me, are admirers of your paper) the difference between these three fishes—the pike, the pickerel, the muskellunge. We have an argument on hand with reference to these fishes, it being contended by one party that they are all one fish in different stages of growth; by another that they are fish of the same species in the same class that a cat belongs to the tiger family. If you will settle this matter for us we shall be much obliged. Further, what is the fish called a wall-eyed pike? are there two kinds of pike—wall-eyed and another kind? Ans. You will find this matter fully discussed on page 360 of the FOREST AND STREAM of July 5th, 1877. The wall-eyed pike is the pike perch (*Lucoperca stictostion Americanum*, Aud.) or pickerel of the Lake Huron Fishermen.

W. H. A., Williamstam, Ct.—I have a setter pup seven months old who has some kind of disease breaking out on him which causes a good deal of scratching. The disease, as near as I can describe it, is as follows: The skin has a whitish, scaly appearance; the hair comes out, and by scratching he makes it bleed and look very bad. It first appeared on his head, but is now spreading down his fore legs and on his belly. Please give me a prescription. Ans. Wash with juniper tar soap (Cazwell, Hazard & Co.'s). Give a teaspoonful of the following three times a day: acetate of potash, 2 1/2 drs; fluid extract of balmony and fluid extract of boneset, each 2 1/2 drs; fluid extract of taraxacum, 1/2 oz; sweet spirits of nitre (Sulphur), 6 drs; syrup sarsaparilla, 1 oz., and water to make 4 ounces. Also apply externally, blackwash as before recommended in these columns until the eruption seems to be healing, then apply the two following solutions with a sponge, mixing them in equal parts just before using: 1. Sulphuret of potassa, 2 oz.; water, 1 pint. 2. Muriatic acid, 2 oz.; water, 1 pint.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCUCLATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

#### CALENDAR OF EVENTS FOR THE COMING WEEK.

**Friday, Sep. 14.**—Trotting: Dubuque, Ia.; St. Joseph, Mo.; Milwaukee, Wis.; Edenburg, Pa.; Long Branch, N. J.; Fort Wayne, Ind.; Pottstown, Pa.; Beacon Park, Boston; Albany, N. Y.; Toronto. Base ball: Chicago vs. Hartford, Brooklyn; Springfield, O. vs. Mutual, at Jansville, Wis.; St. Louis vs. Lowell, at Lowell; Hornell vs. Standard, at Hamilton, Can.; Rochester vs. Buffalo, at Buffalo; Monticello vs. Star of Greenville, at Jersey City. Creedmoor: International Rifle Match, Ottawa (Can.); Metropolitan Rifle Ass'n Match. Regatta of Triton Boat Club, on the Passaic.

**Saturday, Sep. 15.**—Trotting: St. Joseph, Mo.; Long Branch, Toronto. Base ball: Chicago vs. Hartford, at Brooklyn; St. Louis vs. Boston, at Boston; Cincinnati vs. Louisville, at Louisville; Hornell vs. Buffalo, at Buffalo; Jefferson vs. Star of Greenville, at Brooklyn, E. D.; Chelsea vs. Orange, at Orange, N. J.; Alaska vs. Winona, at West Brighton, S. I.; Monticello vs. Montclair, at Jersey City; Syracuse Stars vs. Indianapolis, at Pittsburgh; Champion vs. Milwaukee, at Milwaukee; Rochester vs. Cricket, at Rochester. Creedmoor: International Rifle Match.

**Monday, Sep. 17.**—Trotting: Zanesville, O. Running meeting at Lexington, Ky. Base ball: Champion N. Milwaukee, at Milwaukee; Rochester vs. Cricket, at Rochester; Athletic vs. Norristown Mutuals, at Phila.; Eckford vs. Targor, at Phila.; St. Louis vs. Resolute, at Elizabeth. Shooting tournament at Kansas City.

**Tuesday, Sep. 18.**—Trotting: Zanesville, O.; Potsdam, N. Y.; Poughkeepsie, N. Y.; Clarion, Pa.; Hartford, Conn.; Chicago, Ill.; Narragansett Park, R. I.; Beaver, Pa.; Dover, N. H. Base ball: Chicago vs. Boston, at Boston; St. Louis vs. Hartford, at Brooklyn; Union vs. Independents, at Norwalk, Conn. Shooting at Kansas City, as above.

**Wednesday, Sep. 19.**—Trotting, as above; also Marsden, Conn.; Catskill, N. Y. Running meeting, as above. Base ball: St. Louis vs. Athletics, at Philadelphia.

**Thursday, Sep. 20.**—Trotting, as above, also at Westchester, at Westchester, Pa. Running meeting as above. Base ball: St. Louis vs. Brooklyn, at Brooklyn; Chicago vs. Boston, at Boston. American Rifle Association, Glenbrook.

**SITTING BULL.**—A dispatch from Fort Walsh, Cypress Hills, British North-West Territories, states that it has been discovered that Sitting Bull is no other than Chas. Jacobs, a half breed native of Fort Garry, and an alumnus of St. John's College there. He is an Ojibbera by birth, and the son of Henry Jacobs, an interpreter, living on the Manitoulin Islands of the Great Lakes.

#### THE SOUTHERN SHORE OF LONG ISLAND.

SHOULD any one turn his eyes toward Long Island as a summer retreat, he may have discovered on the northern shore, about fifty miles from New York, a place called Sayville—presumably the village upon the "say." We choose this point for reasons which will hereafter appear. It is situated about a quarter of a mile from the Long Island Railroad depot, and about three-quarters from the beach. The town itself presents a somewhat scattered appearance, as though elbow-room were plenty and land cheap. It is furthermore, quiet, and if not exactly like the land of the "lotos," in which "it seemed always afternoon," the resemblance is sufficiently close to satisfy the requirements of any reasonable denizen of the city in quest of rest and peace. There is no meadow land in the immediate vicinity, and as a consequence mosquitoes are very rare, and malaria unknown. We dispose of these objections in advance, because they represent the two subjects which first call for inquiry on the part of visitors.

As to the positive advantages of the town, it is the centre of a district, in any part of which there are beautiful walks and drives. There are also a good bathing beach, excellent and safe, boating and yachting, and fishing both in sea, lake and stream. Under the direction of Major W. E. Underhill, a gentleman long connected with the Southside Club, and now at Sayville, we pushed explorations in every direction. First, we visited the grounds of Mr. Wilber, which lie on the shore a short distance west of the town. The residence commands a magnificent view of the Great South Bay and the beach, about five miles seaward, and round it are fields and groves, suggestive of rural occupation and secluded leisure. Under the trees near the shore a party of picnickers regaled themselves, and near-by were the evidences that a clam bake formed part of the day's programme. Undisturbed by "a chiel among them takin' notes" they enjoyed themselves hugely, while we continued our tour of inspection. A judiciously selected belt of trees to the west gives ample shelter on that side, and a thick undergrowth affords in places excellent cover for game. Through it runs a narrow lane, beautifully shaded by trees alive with song-birds, and giving glimpses as we pass of the open country to the west. Nothing was wanted to complete the picture but the haymakers, upon whom we very shortly came as they closed their forenoon's labor. The entire place, both house and grounds, is admirable, alike for its beauty and for its all-pervading air of quiet. It is just the kind of retreat to suit a sportsman and country gentleman, who, to his love of the chase, adds a taste for an occasional indulgence in less active operations.

Returning to Sayville, we start for a drive to the west, and at the end of about four miles reach the club-house. It lies close to the shore of a lake, the extent of which we cannot see from the road. The lake nestles charmingly among the trees, and, although small, gives abundant sport to the Waltonian members of the club. It is the best possible place to seek a change from the city club, in the exclusiveness of which it shares, while it transcends it in freedom and society. Where could the *habitué* of the stately city club find a better retreat than in this picturesque building, with its surroundings of sport and charming scenery? He would find a change, but not too great a change; only a country version of the city life he loves. Keeping still further to the west, we pass the Lorillard mansion, and further off see the house occupied by the trainer of the great turfman's stud. We look back with some curiosity toward the cradle of the stars whose victories at Monmouth Park, Jerome Park, or elsewhere, are recorded every week, and conclude that in such a place, and with such advantages, it should not be a hard matter to carry off the honors of the course. About a hundred yards further we reach a point in the road commanding a magnificent view of the land sloping downward to the shore, and of the bay beyond, studded with innumerable sailing craft. Off in that direction, to the southeast, lies Fire Island, and across the intervening expanse of rippling water the yachts are moving like sea-birds on the wing.

As we return to our starting point let us answer an objection that may be raised, viz., that so far we have only looked at what may be called the wealthy side of Sayville. This course was adopted advisedly, for the reason that here the wealthy have been the pioneers. Prospecting like Joshua's spies, they "viewed the land," and finding it healthy, rich and pleasant, they chose their settlements, while Sayville was yet a *terra incognita* to the great mass of panting and enervated humanity in the cities. The rich residents have monopolized nothing but the ground they purchased. They only showed a discrimination worthy of emulation. All the attractions of Sayville are substantially as open to the man who can only snatch a week's holiday as to the millionaire.

Turning now to the east, we drive slowly through Blue Point, looking anxiously for signs of its great oyster industry, and finding it a clean, orderly town, lying a little nearer the beach than its neighbor, Sayville; drive on to a picturesque town, with the euphonious name of Patchogue. Here the Southern Railroad ends, and as we push on to Bellport the ride is made none the less enjoyable by the thought of being beyond the railway system. Everywhere we find the same variety of scenery, the same liberal distribution of attractions, the same proffered alternatives of occupation or amusements.

Our next excursion from Sayville was almost due north, through fine woods and farmlands to Lake Ronkonkoma, a sheet of water not nearly so well known as it deserves to be.

It lies almost seven miles from Sayville and two from Lakeland, in the very centre of Long Island. As we approach it from the south it presented a view of unexcelled sweetness and beauty. A light breeze faintly stirred its placid surface, and one or two small sailing boats gleamed in the sunshine against the background of hills and forest. Keeping to the eastern shore we mounted a gentle ascent, and soon found a point from which we could look down upon the lake spread out in all its splendor at our feet. Its Indian name signifies Sand Pond, but for what reason it was applied as a distinctive title we cannot discover. The greater part of the beach is pebbly and firm, and only at the northern extremities is of the character implied in its name. It is said to be about fifty feet above the waters of the sea, and to rise for seven years and then as gradually to fall for an equal period. A high bank of bluff bounds it on the east, and on the west the shore appears equally steep. A fringe of trees surrounds the lake. When we first viewed it the sun was rapidly sinking down to its couch in the west, and its reflection on the water and the gloomy boundary of forest and knoll made up a scene which very few imagine to exist within fifty miles of New York. To how many, we asked ourselves, is even the name Ronkonkoma familiar? After passing about half way around we turned and left it with regret, but with a resolve that in the hereafter a longer time should be devoted to the contemplation of its picturesque beauty.

And now let us turn to what, after all, is the great attraction of Sayville—its proximity to the sea. We reach the shore easily, and in a few minutes are in a catboat dancing over the waters of Great South Bay, tacking to starboard and larboard in the face of a breeze fresh from the ocean. Thirteen feet below us are the beds from which are taken the famous oysters of Blue Point, and soon we are being initiated into the process of oyster fishing. The wind is delightful, and as the boat skirts along, the few miles between the shore and the Great South Beach are passed over unheeded. In about an hour we land on the beach, and are walking, with the sound of the ocean surf in our ears, up to the Ocean Pavilion. The Pavilion has just been opened, but bids fair to be a resort for sailing parties from every point on Long Island shore between Bellport and Babylon. As we reach the arbor the roar of the tumbling waves becomes louder, and in a few minutes we are in the presence of old ocean. The beach is nothing more than a narrow sand bank, separating the bay, and showing patches here and there of shrubbery from the sea. Directly in front of us the great waves are dashing overall that is left of the wreck of the Vicksburg. Further to the west, about a quarter of a mile, the wreck of another noble vessel, the Great Western, lies broadside on the shore. There is matter enough here for moralizing if one is in the humor—two dismantled wrecks, the huge billows thundering over them, and a few sea-birds screaming above as the spray is thrown up in lofty jets. The wind was moderate, and far away near the horizon were the white sails of two ships, the only moving things upon the waste of waters stretching to the South and West. From a hillock of sand a view can be had to both north and south of the quiet bay, sheltered by the natural breakwater upon which we stand, and of the outside sea. At this point, as at Fire Island, the visitor has the option of bathing either in the surf or in the still waters of the bay. The hours pass swiftly in the enjoyment of the novelty, and of the invigorating breeze, and it is evening and dark before we board the yacht for the return trip. There was no moonlight, but the stars were out in brilliant myriads, and the skipper steered by the Pole star for lack of a light at the landing. A few sailing boats were out, and flitted past into the darkness, and as the wind was fair we returned to Sayville in about half the time it had taken us to go out to the Pavilion.

We have now given an idea of what can be seen and done at Sayville in the way of scenery and recreation, treating it as a centre of holiday operations. There is occupation to be found suited to every mood, and if visitors do not enjoy themselves we know where the blame should be laid.

"THE ONLY ILLUSTRATED."—From its "little fountain" flows forth a rill of authority on canine matters. *Poo majores assurgit.*

We were honored by a call from Hon. J. Hayes Ackley, of New Orleans, last Saturday, who remains at the hotel Brunswick a few days.

ENLARGING.—Mr. Eugene Blackford is enlarging his quarters in Fulton Market. Surely this is evidence of prosperity, and we know of no one who deserves such better.

MUSIC.—Rudolph Aronson, on Monday evening last, formally opened to the public his Musical Emporium, at 10 Union Square. An enjoyable time it proved, several noted artists and amateurs participating.

—The mean mid-day temperature at New Smyrna, Fla., for the month of August was 84 deg. The maximum was 91 deg., the minimum 73 deg.

THE MASSACHUSETTS GAME LAW.—In another column we print a rejoinder from Mr. Lathrop. If the correspondents from our Massachusetts friends has done nothing more it has demonstrated the necessity of a better understanding and more unanimous action among the sportsmen of that State if the present inefficient law is to be improved. The question is who made the old law, but how can more efficient legislation be secured.

GAME PROTECTION.

EDITOR FOREST AND STREAM:

Allow me a line or two in response to Dr. Ordway's letter of the 25th.

It is true I did make the original draft of the game bill that was submitted to the sportsmen last winter, but the objectionable clause was not in it then, but was "amended" into the bill afterward. I was not aware that I was "trying with bombast to belittle the hotel keepers and sportsmen of Boston." I only told facts, and without "bombast." I know that it is not attempted to enforce the law at Boston, and any law is "inoperative" that is not enforced. I am as anxious to get a good law as is Dr. Ordway, and I hope to see a good game bill some time, and should be glad indeed of all the "accumulated wisdom" and aid that the doctor or his society could give us in acquiring one. One thing, however, is true; but there must be more unanimity of opinion among sportsmen concerning close seasons and strict protection before we can attain supreme success. The "killed in the commonwealth" clause in the present bill was inserted by a sportsman, and so the bill was impaired by its professed friends. One thing is patent to all who have had to do with the passage of a bill in the Legislature, and that is that there are more antagonistic elements to meet, I believe, than there are concerning fish legislation. The hotel keepers make merchandise of birds and proclaim that they will serve them, whatever the law is, when they please (and this in Boston, too), and the farmers are largely jealous of game protective laws, and they must be conciliated and convinced. Even sportsmen with diverse views block successful issue. But in the happy time to come, Doctor (perhaps when we are all dead), the game laws may be made perfect. I hope we both may live and see it, and to that end I work; and believe me I do not detract from the "Anglers' Association" a particle of praise to which they are entitled. I am glad the Doctor announced that he prefers "Mr. Hallock's opinion on the legality of any fish or game law" to mine. A most excellent choice, no doubt, for it leaves me what I prefer—my own opinion.

The types made bad work in one place in my last letter. In that part giving the illustration of A selling game to B, "killed in town" should be "killed in Conn."

Springfield, Aug. 31, 1877. E. H. LATHROP.

Philadelphia, Sep. 7.—Wm. B. Elliott, formerly Collector of Internal Revenue for this district, was arrested on the 4th inst. by agents of the Philadelphia Sportsmen's Club, for violation of the game laws of this State, having killed fourteen rail birds before the season. He was fined the usual amount (five dollars for each bird) and costs, seventy-six dollars, making it rather expensive shooting. This is the second time Mr. Elliott has been arrested for a similar offence.

Robert Swan and John J. Kennedy were also arrested for shooting reed birds out of season, and for shooting on Sunday, on the marsh near Darby Creek. They were taken before Mayor Forewood, of Chester, and fined.

Several other arrests have been made by the Agents of this Club, who are doing their utmost to enforce the game laws.

THE GAME LAWS IN NOVA SCOTIA.

HALIFAX, Sept. 1, 1877.

EDITOR FOREST AND STREAM:

The 1st of September is a great day with sportsmen among the stubble fields of Old England, and here in Nova Scotia too, in a smaller way, we have some excitement among the lovers of field sports, for on this day commences the open season for woodcock (*Philohela minor*)—the finest and most delicious of American game birds. Hares and rabbits may also be legally killed from this date. Partridge shooting will commence on the first of October. This day is also especially interesting as making an epoch in the history of the game laws of Nova Scotia—for the old laws which for the last three years have been in force expire, and the new law comes into operation—under this law it will be lawful to kill moose and cariboo during the months of October, November, December and January. Not more than three moose and five cariboo can be lawfully killed by any one person or number of persons forming a hunting party in any one season. Another new feature introduced is the issuing of game licenses, about which I would like to say a word, if you will kindly give me space, as it is a novelty in colonial legislation. First of all, let me remind those disposed to carp at it, of the great advantages a sportsman in the colonies enjoys over his brethren in England. There you cannot hang a gun over your mantelpiece (if it is only to kill cats in your backyard) without having to pay a gun license of ten shillings; then you have to pay from three to four pounds sterling for a shooting license; and that is not all, for you must then bargain with the owner of the preserves, who perhaps will not let you shoot at all. In this country, until now, the game of our forests has been free to all as the air we breathe, and because the withdrawal of the Government grant (from which the Commissioners and Wardens salaries were paid) has necessitated the imposition of a small tax, a shout of indignation, I understand, has arisen from a certain class, who, I think, should be very thankful that they are let off so easily.

The arguments in favor of the system (if any such were needed) are briefly contained in the following extract from my last report to the Government:

"The game is appurtenant to the soil, and belongs to the people of Nova Scotia, just as much as in England it does to the lord of the manor. Our forests are the people's preserves, and if we protect them we have the right to regulate the way in which they are to be used. The inhabitants of Nova Scotia have to contribute to the general revenues of the Province in order to carry on the different departments of the public service. Out of these revenues a certain sum has been expended for the last three years to defray the expenses of preserving the game. Is it fair then that outsiders, who pay nothing, should step in and enjoy the benefits which have resulted from this protection, equally with those who had to bear the burden of the expense, and the responsibility and trouble of

carrying out the laws? I do not anticipate that there will be much opposition to the proposed amendment. A clause is inserted in the act providing that no person, not having his domicile in Nova Scotia, shall enjoy the privileges of the game laws unless he first obtain a license from the Provincial Secretary's office, signed by the Chief Game Commissioner and countersigned by the Provincial Secretary or deputy, for which he shall pay twenty dollars into that office. Licenses to be in force for a year.

"Officers of the Army and Navy on service in this garrison are placed in a different category, and it is proposed to issue licenses to them on the payment of five dollars a year, to which I think there can be no reasonable objection. In addition to the justice of this enactment in itself, there is another reason in its favor which should have some weight. It is proposed that these license fees should be paid into the Provincial Secretary's office, and form a fund toward defraying the expense of carrying out the law."

The game licenses have been very neatly printed by the Queen's printer, and can be procured in the city at the Provincial Secretary's office, or from the Chief Game Commissioner; and in the country, in Queen's County, from W. S. Crocker, Game Commissioner, Brookfield; from Game Commissioner A. Bigny, Wentworth, Cumberland County; E. C. Dawson, New Glasgow; Duncan McDonald, English Town, Victoria Co., C. B.; D. W. Arichibald, Sheet Harbor, and Samuel Murphy, Mount Uniacke, and from Game Wardens, W. S. Gilpin, Digby; Thomas Kirk, Jr., Parrsboro; Ephraim Cook, Acadia Mines, Londonderry, and John L. Smith, St. Mary's; and the Issuers of Marriage Licenses in the following places: Liverpool, Digby, Yarmouth, Shelburne, Amherst, Sydney, C. B., and from Thomas Crosskill, Bridgetown, Annapolis Co.

The Game Protection Society has endeavored by every means in its power to give the utmost publicity to the new law by the distribution of hundreds of large posters throughout the Province, and by printing it in pamphlet form which can be procured from the Secretary. And although I am well aware of the legal maxim, *Ignorantia legis non excusat*, yet our object is to remove all possible cause of complaint on the part of those who, when detected, may seek refuge for their offense in alleged ignorance of the law.

The law which to-day comes into operation is undoubtedly sound in principle, as it is nearly perfect in detail, and it only remains for its friends to see that it is enforced.

The withdrawal of the Government grant no doubt will create some difficulty, but I am happy to say that all the Commissioners and Wardens, without an exception, have agreed to continue their services gratuitously for this year in the hope that next session the small grant (\$1,950) will be renewed. Of course they cannot be expected to give the same time and attention to it as when they were paid officials, but yet it is gratifying to find them willing to do what they can. I call the attention of policemen, market clerks, etc., to the clause of the act affecting them as follows:

"13. It shall be the duty of all Justices of the Peace, Stipendiary Magistrates, constables, policemen and market clerks to enforce the provisions of this act and of any other enactment for the preservation of useful birds and animals, whenever the infringement thereof comes under their notice, under a penalty of not less than \$10 for each omission of duty."

A knowledge of these facts may be of benefit to those of your readers who may contemplate visiting Nova Scotia next month, as it contains a list of parties from whom game licenses can be procured without the necessity of coming to Halifax. The class to whom I allude as objecting to the licence clause I need not tell you are not American citizens, several of whom have already taken out their licences and paid the fee without grumbling.

FITZ. COCHRAN,  
Chief Game Commissioner.

ILLINOIS GAME LAWS.—The Revised Statute of Illinois for 1877, Section 1, reads: "That it shall be unlawful for any person or persons to hunt or pursue, kill or trap, net, ensnare, or otherwise destroy any prairie hen or chicken or any woodcock, between the fifteenth day of January and the first day of September in each and every year; or any deer, fawn, wild turkey, ruffed grouse (commonly called partridge) or pheasant, between the first day of February and the first day of October in each and every year, or any quail between the first day of February and the first day of November in each and every year, or any wild goose, duck, snipe, brant or other water fowl between the first day of May and the fifteenth day of August of each and every year."

—Apropos of a tinker having been sentenced to two months' imprisonment with hard labor for breaking the leg of a game fowl, the *Pall Mall Gazette* thinks it unfortunate that the fellow should have been tried before Justice Partridge.

VIRGINIA FISH AND GAME ASSOCIATION.—This association, of which Mr. Chas. T. Palmer is the President, is to hold a meeting at Richmond, on Wednesday of fair-week. The society is actively engaged in preparing casts of the fishes of the State for exhibition on that occasion. Gen. Vance is to make a speech, and all possible efforts are to be employed to secure public attention to this important subject.

To persons seeking healthful recreation and enjoyment, without being subjected to the usual annoyances of "fashionable" sea-side resorts, the Franklin House, Plymouth, Mass., affords unusual opportunities, having unusual facilities for harbor, river or surf bathing, while splendid opportunities for boating in either smooth or rough water may be enjoyed at choice. Cooling breezes, comfortable rooms, a well supplied table, and a reasonable scale of prices are all to be found here.

NOTICE TO SPORTSMEN.—Having received so many communications asking us for information in regard to our six-section bamboo trout, black bass, grise and salmon rods, we have prepared a circular on the subject, which we shall take pleasure in forwarding to any address. We keep on hand all grades, the prices of which range from \$15 to \$150. We put our stamp only on the best, in order to protect our customers and our reputation, for we are unwilling to sell a poor rod with a false enamel (made by burning and staining to imitate the genuine article) without letting our customers know just what they are getting.

P. O. Box 1,294.—Adv. ABBEY & IMBRIE, 38 Maiden Lane.

OUR WASHINGTON LETTER.

SHOOTING ON CHINCOTEAGUE ISLAND—WILLET, CURLEW, GRAYBACKS, ETC.—FATAL ACCIDENT—MARSH SHOOTING—ADVANTAGES OF ADVERTISING IN FOREST AND STREAM, ETC., ETC.

WASHINGTON, D. C., Sept. 5, 1877.

CHINCOTEAGUE ISLAND on the coast of Virginia, is so rapidly becoming a favorite resort for sportsmen not only from Washington, but from New York, Philadelphia and Baltimore, that a brief description of the place, the shooting, fishing, etc., it is hoped may be interesting, now that the birds are plentiful and the accommodations for visitors ample. What known as the Eastern Shore of Virginia is a peninsula composed of Accomack and Northampton Counties, lying between the Atlantic Ocean and Chesapeake Bay. Chincoteague Island is in the Atlantic, just east of Accomack County, and separated from it by a body of water known as Chincoteague Bay. The shores of this bay on both sides are covered by extensive salt-water marshes which furnish abundant food and ample shelter for willet (*Totanus semipalmatus*), gray backs (*Tringa canutus*), long billed curlew (*Numenius longirostris*), Esquimaux curlew (*Numenius borealis*), and various species of snipe, sandpipers, and other birds usually found upon the salt marshes of our middle districts.

General W. D. Whipple, of General Sherman's Staff; Col. Harry Clark, the efficient Washington agent of the National Press Association, and Master Walter Whipple, a son of the General, recently spent a week at Chincoteague, and had magnificent sport, although the season was just opening. Upon their arrival there they found the hotel crowded with summer visitors from Baltimore, Philadelphia and other cities, but fortunately they were provided with letters of introduction to Lieut. Herring, commanding the revenue marine schooner Report, and that officer had them comfortably quartered. One of the crew of the vessel proved himself to be an excellent cook, and the birds killed during the day were served by him in a style not to be excelled by any professional.

Willet were found to be most plentiful, as they breed in the marshes surrounding the island. Indeed this bird I believe breeds all along the coast from the mouth of the Mississippi to New York, but passes the winter on the shores of South Carolina, Georgia, Florida, and the Gulf coast, where it is known as the stone curlew. The propensity of the bird to remain in the immediate vicinity of the coast is such that it is seldom met with inland even along the shores of large rivers. It is at all times shy and wary, so that in approaching it the sportsman must use the greatest caution. After being once shot at, they watch your motions very closely, and the cry of one bird seems to alarm all within hearing. When wounded and brought to water they swim tolerably well but cannot dive. The young birds now are fat and juicy, and the breeding season being over they are found in flocks, it being their habit for several families to join after that season and live harmoniously together.

The long-billed curlew, the largest of this species found in North America, is the only one which may be classed as a permanent resident. It breeds to a great extent about Chincoteague, though not so abundantly as on the more southern coast of the United States. They are not easily approached, and, besides, it takes a good charge to bring them down. When wounded they skulk off among the thickest vegetation, where they remain perfectly silent. The flesh of this bird does not compare with that of the willet as a delicacy, although many persons consider it good, and they are always found for sale in our Southern markets.

The gray-backs, or red breasted sand pipers, when young and fat, are very palatable. In season they are plentiful, feeding on the small shell fish found at a short distance below the surface, oftentimes in heaps like masses of wet grain. But to give an extended description of the many desirable birds found in the neighborhood of this island would be almost impossible. It affords delightful sport in fishing as well as shooting. Oysters are abundant, and probably there is no place on the Atlantic coast, where the sportsman can enjoy himself more than at Chincoteague. There are a number of persons residing in that vicinity who make a business of furnishing boats and piloting them in search of sport. The gentlemen named who recently visited the island were fortunate enough to secure the services of a veteran guide named Decatur Birch, commonly known as "Cale." He provided the boat, and conducted them to the most desirable shooting places for the very moderate sum of two dollars a day. He is thoroughly posted in his business, and his services are well worth that sum. The hotel at Chincoteague is four stories high, containing about forty-eight rooms, and it should be advertised in the columns of FOREST AND STREAM AND ROD AND GUN, which would greatly add to its popularity and let sportsmen know something about the facilities which the proprietor has to care for them.

The route to the island from New York is by the line of the Old Dominion Steamship Company to Lewes, Delaware, as will more fully appear by reference to the advertisement of that company in another column. There are also other routes thereto from Philadelphia and Baltimore.

A distressing accident occurred on one of the marshes near this city yesterday, which resulted in the death of a youth about fourteen years of age. By some accident the load in the gun in the hands of his companion was discharged, and the contents lodged in the boy's head, causing death in a few hours. It is too often the case that boys not large enough to

level a gun are permitted to go with companions who are reckless, and numerous accidents result therefrom.

Many ortolan have been killed on the marshes in the neighborhood of this city, but reed birds thus far are very scarce. The markets and restaurants are well supplied with ortolan, and the birds are in fair condition.

There is an absurd law here which forbids the shooting of ortolan and reed bird before the 5th of September, and a still more absurd one passed by the authorities of Prince George County, Md., which prohibits the shooting of them on the marshes of the Patuxent prior to the 15th of September. These birds arrive on the marshes in this vicinity, as well as those of the Patuxent, during the last ten days in August, and, as they do not breed in this locality, there is no reason why they should be protected longer than the 1st of September, by which time they are always in good order and fit to kill. The birds breed on the borders of the great lakes of the north, and tarry here on their return south. The young birds are with them, but full grown. As they are frequently driven further south by a sudden cold snap which occurs before the 20th of September, we have but little opportunity to shoot them; indeed many of the birds leave the marshes of the Patuxent before the close season expires, and the shooting there is destroyed on account of an absurd law.

Some of our Washington tradesmen who make a specialty of goods used by sportsmen, would do well to follow the example of Mr. Geo. C. Henning, the enterprising tailor, who offers very good articles in the shape of hunting suits, shooting coats, etc., and makes known his goods through the advertising columns of *FOREST AND STREAM* and *ROD AND GUN*. He is aware of the fact that the paper has a large circulation in Washington, and he has always found it paid to patronize its advertising columns. There are other dealers here who would add to their business by judicious advertising, and the journal best suited for that purpose is the one which is read by sportsmen. The experience of Mr. Henning is like that of other wide-awake dealers all over the country, and that is that every dollar spent in advertising in *FOREST AND STREAM* is repaid tenfold by the increased trade brought by such advertisement.

## The Rifle.

### THE INTERNATIONAL MATCH.

In our next we hope to give the full story of the great international match, and chronicle for the seventh time a victory for the "Yankee lads." Saturday last the practice was brought to a finish. The close of this preliminary practice gives opportunity for a brief comparison before the final struggle, and certainly the British chances do not seem very bright in such a bringing-together of statistics. The men in these trial days, rehearsals of the great match in every respect, have striven their best, and in the absence of the distracting influences of great crowds, and without the pressure of a last final effort, the scores doubtless exhibit the full power of the teams. The Britishers have fired six full scores, but on two of these days the Americans did not fire by their side. Taking the six last practice shoots of the separate teams the following exhibit is reached:

#### AMERICAN TEAM.

| Evans.....          | 194      | 183      | 203      | 203      | 191      | 188      | 1,162  |
| A. B. Halliday..... | 195      | 198      | 195      | 198      | 201      | 198      | 1,159  |
| Col. Penton.....    | 179      | 189      | 199      | 189      | 199      | 192      | 1,147  |
| Total.....          | 1,536    | 1,574    | 1,618    | 1,584    | 1,569    | 1,549    | 9,410  |

This would show an average score per day of 1,569 for the English, against 1,609 for the American team. It is noteworthy, too, that the three Irishmen head the British side, followed by the lone Scotsman, these four gentlemen shooting the Rigby rifle, while the four Metford shooting Englishmen foot the squad. On the 28th and 29th ult., the double days' score shows a lead for the Americans of 137 points, while on the 4th and 5th insts., when the teams again shot together, the scores were 97 in favor of the Americans. The British riflemen, while acknowledged to be, as Sir Henry claims, the best team which Great Britain could send out, are deficient as compared with the American in the matter of system in team practice, of position in firing, and in the matter of rifles. In questions of individual expertness and in wind judgment they do not appear to be one whit behind, while in experience they are far in advance of the home squad.

The competition is against the best team which Great Britain, the only long-range shooting nation of Europe, can produce. On it the Englishmen have rested their entire hopes, and their assertion in advance that a victory for American riflemen during the present week will leave them beyond dispute the master marksmen of the world, gains point from the claim of the English riflemen last year that a success over the Scotch, Irish, Australian and Canadian riflemen was but a divided victory after all, and not until

the imperial team is defeated will the British representatives fail to consider themselves as good as the best. With a hot day victory is almost certain to the home squad; with a broken, tempestuous day, the balance may incline either way, while with a fish-tail wind and undefined light poor scores may throw a nominal victory on either side. The contestants themselves wish a fine shooting day, high scores and a nip-and-tuck contest. Everything has been done to insure a perfectly fair match, and should failure meet the visitors they can put no fraction of their defection to any lack of opportunity given them by the American riflemen and the American National Rifle Association.

### THE FALL MEETING AT CREEDMOOR.

With fine weather and pleasant surroundings of wind and sky, the fifth annual fall prize meeting opened at Creedmoor on Monday morning last, with every promise of a most successful carrying out. Careful preparation had been made, and the details worked more smoothly than at any previous gathering. The duties were more carefully defined and sub-divided, and the working officers did not touch upon each other's department. Gen. Woodward made the excellent executive officer he always is, and in the selection of an adjutant to relieve him from the importunities of the "press gang," introduced a most happy innovation. Capt. Story wrestled with the exasperating problem of score-tickets, and, with such aid as he possessed, got the returns out with fair celerity.

The morning opened with a full line of 200 yards targets, from side to side of the range, ready for the peppering of the 217 entries of the Judd match, which was entered upon at 9 o'clock, and fired off without special interest, other than an uncalculated-for bit of impertinence inflicted upon Lieut. Penton of the British team by a sprout of a scorer. The record of the leading scores is shown in the following summary (Weapon, any military rifle; distance, 200 yards; position, standing; rounds, 7; entrance fee, \$1; open to all comers; 217 entries):

|                     |                |                     |                |
|---------------------|----------------|---------------------|----------------|
| E.W. Whitlock.....  | 4 5 4 5 5 5-33 | J.R. Nichols.....   | 4 5 4 5 4 4-30 |
| W.H. Glider.....    | 5 6 4 4 5 4-32 | Dudley Selph.....   | 5 5 4 4 4 4-30 |

| G.D. Hobarth.....   | 5 4 4 4 5 5-31 | J.P. Warren.....    | 4 4 4 4 4 3-30 |
| A.F. Finley.....    | 5 4 4 4 4 4-31 | Geo. White.....     | 4 4 4 4 4 3-30 |
| W. Brockhoff.....   | 5 4 4 4 4 4-30 | J.L. Price.....     | 4 4 4 4 4 3-30 |
| J.L. Bondell.....   | 5 4 4 4 4 4-30 | H.T. Clark.....     | 5 4 4 4 4 3-30 |
| W.M. Farrow.....    | 29             | W.A. Perry.....     | 29             |
| J.R. Grohman.....   | 29             | J.V. Oliver.....    | 28             |
| E.W. Burd.....      | 29             | Jas. Cook.....      | 28             |
| C.G. Reamer.....    | 29             | R.H. Stafford.....  | 28             |
| E.A. Eason.....     | 29             | J.L. Mills.....     | 28             |
| S.V. Kennedy.....   | 29             | J.L. Farley.....    | 28             |
| A. Crosey.....      | 29             | F.N. Holbrook.....  | 28             |
| E.H. Sanford.....   | 29             | J.E. Steison.....   | 28             |
| W. Brockhoff.....   | 29             | Jos. Turley.....    | 28             |
| S.F. Keagland.....  | 29             | B. Mix.....         | 28             |
| E.H. Ladd.....      | 29             | R. Walker.....      | 28             |
| E.H. Snook.....     | 29             | R.G. Post.....      | 28             |
| E.H. Snook.....     | 29             | C.P. Le Breton..... | 28             |
| T.H. Holton.....    | 29             | W.F. Leeman.....    | 28             |
| T.R. Murphy.....    | 29             | J. McComb.....      | 28             |

The short-range match followed close upon the Judd match. The only difference between the matches being in the matter of rifles—in the one match of military pattern, and in the other of any build. The scores did not seem to show any very decided improvement on an average, and the leading score stood the same in each match. In this second contest of the meeting, the record showed (Open to all comers; weapon, any rifle; distance, 200 yards; seven rounds; position standing; entrance fee, \$1; 267 entries):

|                       |                |                       |                |

Recess was now for a time the order of the range, and while the marksmen scrambled for beer and sandwiches, the only provender accessible, the old-range targets were changed from 3d to 2d class, in anticipation of the afternoon's mid-range work. On the new range the cavalry proceeded with their carbine match at 200 yards, and for the first time in ever so long the Yates men did not have everything their own way, and the "water cooler" which the Syracuse men so feared to get will not yet fall to their lot. The Washington Grey Troop headed the list with a good first place, and celebrated their victory by a reception in the evening to the visiting men at their runcry in the city. The record of the Cavalry Match stood (Open to teams of seven from any troop, or other organization armed with carbines of the National Guard S. N. Y.; to appear in the uniform of their corps; distance, 200 yards; position, standing; rounds, seven; weapon, Remington breech-loading carbine, State model; trigger pull not less than six pounds; entrance fee, \$1 each man; ten teams):

| Total.....              | 173            |

At the 500 yds. range two matches were contested—first, that for the Army and Navy Cup and then that for the Gatling Gun. The first is open to the entry of teams from any military organization, but the militia were the only contestants, though it was hoped and expected that a team from the Willets Point Engineer corps would represent the regular army. The Oswego "woodchuck" shooters showed a clean pair of heels to the whole crowd, and made a very creditable showing with 328 in the possible 420. The scores running:

| THE ARMY AND NAVY CUP MATCH.  |                |
|---|----------------|
| Open to teams of twelve from all regularly organized military organizations in the United States, including regular army, navy and marine corps. Weapon, such military rifle as has been issued at the public expense to the organization which the team represents. Distance, 500 yards. Rounds, seven; position, any within the rules. Entrance fee, \$1 each competitor. |                |
| Forty-eighth Regiment.  |                |
| Lieut. Col. C.V. Houghton.....  | 5 4 5 4 5 4-32 |
| Captain A. Curtis.....  | 4 5 5 5 5 5-31 |

| Private J.P. Hall.....  | 2 3 5 3 2 3-20 |
| Total.....  | 328            |

The Gatling Gun Match, fought at the conclusion of the Army and Navy Match, was another success for the Oswego men. The Seventh made a strong bid for the gun, but the "woodchuck" shooters proved too much for them, and a second first prize was booked for Oswego. The record of the match showed (open to teams of twelve from any regiment or battalion in the State of New York; weapon, Remington State model, 500 yards, seven rounds, any position):

| FORTY-EIGHTH REGIMENT.            |                |

| Total.....                        | 376            |

The first stage of the Champion's Match was fired through by the seventy-seven entrants at 200 yards, and out of the possible 50 no less than three 47's were made by Fulton, Capt. Burns, of California, and G. L. Moore, of Yonkers. There was some shooting at the running deer during the day. The repeating rifle, which was the day prize, was taken by an officer of the association, together with a liberal amount of maledictions for the manner in which the match was summarily closed by another member of the directory. At present we can only say that the match ended very abruptly.

The second day of the fall meeting at Creedmoor passed off even more uneventfully than the first. Three team matches for the State and First and Second Division prizes filled the programme. There were no protests, no charges of unfair play; and while there were, of course, many disappointed teams, the results were arrived at after full, free, open endeavor on the part of all. The same excellent order which marked the first day was again maintained. The morning was given up to off-hand shooting in the opening stages of the three matches named. During the afternoon hours the 500-yards stages were contested, and long before sundown the closing gun had been fired, the conclusions announced and the men were either snugly under canvas in their tent houses on the range or were off cityward.

The State match was a genuine surprise, the great majority of those who have been watching the performances of the team were of opinion that the 48th Oswego Regt. would be the lucky squad, and particularly was the opinion held after their brilliant victories in the Gatling Gun and Army and Navy Cup matches of the day before. At the 200-yard range the 7th Regt. were leading, though they were closely pressed. In opening at 500, however, Capt. Jas. L. Price, of the 7th team, made a curious blunder, and through his oversight lost his score at that range. When the gun fired announcing the opening of the second stage of the match, Capt. Price was at the pool target, and forgetful of the rule which says, "Any member of a squad or firing party who shall absent himself without leave during the firing, or fire a shot from any other firing point before the squad has completed its shooting (except in pursuance of orders) shall be disqualified in that competition." As Capt. Price had fired at the pool target after

The match had opened for the second stage, his score at that range was declared void by the executive officer when his attention was called to the circumstances of the case. But even without this the 7th team would have had only fourth place, the 14th team having a safe first by 13 points over the 23d, and 17 over the 48th boys. The "Woodchuck" was fully routed, and while they have done well and shown themselves fit to rank with the first, the Oswego men did not hold their own against the red-capped representatives of the Veteran Regiment of Brooklyn. (Open to teams of twelve from each regiment or battalion of infantry of the National Guard of the State of New York; all competitors must appear in the uniform of their corps; distance, 200 and 500 yards; position, standing at 200, any at 500; weapon, Remington rifle, State model; rounds, five, at each distance; entrance fee, \$1 each; sixteen teams competing; first prize, State trophy, presented by Governor Robinson, value \$500; second prize, \$100 trophy; third prize, \$75 silver vase, and fourth prize, a \$50 trophy):

| Fifteenth Battalion.....    | 194 | 176 | 370 |

In the First Division match there was a good fight for first place, and notwithstanding the fact the Seventh secured a lead at 200 yards, the superior shooting of the Scotch element in the Seventy-first Regiment team secured them the honors, after a close round, at 500 yards. It was, in fact, a victory for the old Seventy-ninth Highlanders, and "Auld Scotia" and her sons felt proud of their power. Of the nine regiments in the First Division, six only were represented, the Twenty-second (Col. Porter), Fifth (Col. Spencer) and the Eleventh (Col. Umbekant) being the absentees. The full scores stood (Open to teams of twelve from each regiment or battalion of infantry in the First Division, N. G. S. N. Y.; competitors to appear in uniform and shoot with State model rifle; 200 and 500 yards; 5 shots each distance; position standing at 200, nay at 500; first prize, the Division trophy, value \$100; second and third prizes of \$75 and \$50, respectively; six teams competing):

| Seventy-first Regiment, |     |     |                |                |     |     |                |

The Second Division match drew out all the Brooklyn organizations into a lively team contest. Capt. Farley almost got his Fourteenth Regiment team to the front for the second point, failing but one point of victory, which followed the usual course of other years in going to the Twenty-third team. The scores ran (Open to teams of twelve from any regiment or battalion in the Second Division, N. G. S. N. Y., or conditions as in First Division match; all the seven organizations of the Second Division represented):

| Twenty-third Regiment. |     |     |                |               |     |     |
|------------------------|-----|-----|----------------|---------------|-----|-----|

NEW YORK—*Waverly*.—The Waverly Rifle Association's contest for the silver cup presented by E. F. Wells, ended in favor of D. D. Knapp, the secretary of the club, at their range a few days since; shooting 15 shots each; distance 800, 900 and 1,000 yards. The wind varying as usual through the Shepard Ravine from 0 to 8 points side and rear. The scores stood:

[illegible]

THE NEVADA BADGE.—A Co., Forty-eighth Regiment, N. G. S. N. Y., shot for the Nevada badge on the 6th inst., and their score is certainly a most excellent one. Last year they were successful on a score of 25 10-46 per man, shooting 46 men in the company. By a change in the conditions, they were this year permitted to shoot with a minimum of 35 men, and the average leaps to 33 47.100 per man out of the possible 50. The aggregate last year with 46 men reached 1,169 points; this year, with but 35 men, the total reached 1,171 points. The *Los Angeles Times* is happy, and yet sees a looming danger in the success of its friends, saying: "This score is likely to discourage competitors up to this time no other company has announced its intention of competing for the badge, and after this score is announced we hardly think any of them will care to shoot against it." The weather conditions during the match were fair, and the shooting was witnessed by Col. Manning, Division Inspector of Rifle Practice, and Major Chapman, Engineer of the Twenty-fourth Brigade. The range totals stood:

|             | 200 | 150 | 500 | Yrs            |     | 200 | 150   | 500 | Yrs |

STRING SHOOTING.—The National Rifle Club held their twentieth annual meeting on the 5th and 6th insts., at South Vernon, Vermont, on grounds near the railroad, desert, and

Very few veterans were present, except the Birmingham correspondent, and the club's headquarters were the main hall of Dr. S. F. Priest, whose judicious arrangements were everything to be desired by rifleman or layman. The weather was clear, but the wind high and too swift for close shooting. The attendance of members, as also of lookers on, ran a large, though usual. The order of the day was: Three ten strings at 40 rods, position and rest without restriction; standard weight of rifle, 15 lbs., every excess handicapped under the rules of the club; a prize, pro rata, to each of the best three of every ten string, and the medal to the best aggregate. Following are the scores in inches, 8ths and 16ths, of the respective winners:

|                                  |                                 |
|----------------------------------|---------------------------------|
| First String—N S Brockway. 9.5.0 | Second String—N Hatch....16.4.1 |
| D A Brown....14.1.0              | Third String—E J Day..... 8.7.0 |
| L Annadon.... 14.3.1             | H Houghton.14.5.1               |
| Second String—D A Brown...13.2.0 | E Phillips....15.5.1            |
| N S Brockway.16.2.1              |                                 |

Best aggregate, President J. Williamson, N. Y., 43.2.0.

NEW YORK—*Oscego*, Sept. 6.—Company A, of the Forty-eighth Regiment, shot here to day for the Nevada badge, under the new rules, with 35 men, scoring 1,171. Last year, with 45 men, their score was 1,169.

—Twelve clubs have now entered into affiliation with the National Rifle Association.

WISCONSIN—*Milwaukee, Sept. 3.*—The officers elected at the last meeting of the rifle club are: Pres., John Johnston; Vice Pres., Gen. E. W. Hinks; Sec., Chauncey Simonds; Treas., D. B. Frankenberger; Ex. Com.—H. P. Hale, Jno. R. Goodrich, H. Drake; Finance Com.—C. T. Hawley, John Nazro, O. B. Hopkins; Range Com.—J. C. Weiles, E. Bangs, E. Fielding.

A REPLY TO THE SCOTSMEN.—As a fitting final movement to the flow of correspondence following the Scottish protest, the subject of the letter has been sent from this side. It must be understood once and for all by the Scotchmen, that in connection with this trophy, that the "conditions as established and constructed by the Board of Directors" are to hold binding upon the trophy wherever it may rest, and whoever shall contest for and win it, with any mental reservations on any of the points in dispute, takes a dishonest and ungentlemanly course of procedure and acts under false pretences in the matter:

THE NATIONAL RIFLE ASSOCIATION, Office, }  
23 Park Row, New York, September 7, 1877. }  
MR. R. RENTON, Hon. Sec. National Rifle Club, Scotland, 67 West

Dear Sir—I have the honor to inform you that at a meeting of the Board of Directors of the National Life Association, held on Thursday, Sept. 6th inst., your letter of the 21st August, referring to letter of 28th July, previously received and enclosing newspaper copy of a letter from you to Mr. H. Ross, was presented, and the Secretary thereupon directed to acknowledge the receipt of your letter, and inform you that the conditions to govern Competitions for the American Centennial Trophy originally established, and as construed by this Board of Directors, cannot now or at any time hereafter be altered either by the Board of Directors or by any other authority.

I am, Sir, with great respect, your obedient servant,  
GEO. S. SCHERMERHORN, JR.,  
Secretary National Rifle Association.

THE CANADIAN MATCH.—In the account given in your last issue of the American-Canadian match by your Toronto cor-

respondent I notice some inaccuracies which I trust you will allow to be corrected. 1st. Bell used a Rigby rifle, not a Metford, and Gibson used a Rem. Creed., not a Metford. 2d. It is scarcely accurate to say that the only opportunity offered to the American's practice was by their taking part in the small bore matches in progress on their arrival. A target had been set apart specially for their practice. This target they used in the competitions, shooting by themselves with the usual coaching of a practicing team. 3d. It is ungenerous to say that the Canadians expected to achieve an easy victory. It would be stating facts more accurately to have said that the Canadians expected a more decisive defeat. 4th. Your correspondent lays too much stress on the absence of coaching on the part of the Canadians, and not enough on the fact that of the four Canadians who used the Remington three had had them only a short time in practice, and have not yet learned all that is to be known in the successful management of that rifle. The Canadians are by no means discouraged by the result. They have had great pleasure in welcoming the Americans on Canadian ground, and I trust that efforts will be made by them to put in a creditable appearance in next year's contest for the Centennial Trophy. J. M.

Hamilton, Sept. 10, 1877.

THE GARDNER GUN.—Captain William Gardner, who has perfected the actions of several superior guns for both sporting and war-like uses, has been exhibiting at Newport his new invention. The gun has but a single barrel, and weighs only forty-three pounds, or little more than than one-ninth the ten barrel Gatling gun, whose weight is 350 pounds, while the French mitrailleuse, with thirty-seven barrels, is still heavier. Captain Gardner's gun is supplied with cartridges, which are placed in a vertical slot, ten at a time, and thence forced by a rapidly revolving crank into the barrel chambers when they are discharged. With two men to work it, one to feed and the other to turn, the gun discharges 300 bullets per minute. The report has been likened, by a newspaper correspondent, to that of a sharp b-r-r-r-r-r. At one of the experiments with this formidable piece, in the presence of army and navy officers, at a range of fifty yards it cut a tough white oak timber nearly twelve inches square in two in forty-five seconds. The inventor has fired it in the presence of an army officer 2,600 times without the loss of a second, and that while the gun was then found to be foul, it was in perfect working order; nor was it heated to a degree that rendered it necessary to discontinue the firing. This result, it is said, is secured by giving a greater weight of metal to the one barrel than is given where a number of barrels are brought together. Altogether this arm surpasses anything heretofore invented. With batteries of Gardner guns the Turks and Russians ought to make short work of each other.

PENNSYLVANIA.—*Driftwood*.—According to the local paper, a man while berrying near this town, recently shot a deer in the close season under these peculiar circumstances: "The deer seemed to think he was a privileged character, for the man says the animal attacked him and in self defense he was
